Auburn Automobile Co., Auburn, has purchased adjoining property for addition for which plans will soon be drawn. New unit will be equipped in part for engineering and experimental work and will cost more than \$75,000. Company is completing expansion program at branch plant at Connersville, to include assembling department, enameling unit and final testing department, to cost about \$450,000 with equipment.

Part of plant of Advance Stove Works, Evansville, was recently damaged by fire.

Globe Gas Regulator Co., Anderson, is clearing ground for an addition, 24 x 80 ft., to be used as an assembly room.

Canada

TORONTO, Nov. 5.—October machine tool sales showed a slight increase over those for September, which was one of the best months this year. Both current and prospective demand is at a satisfactory level. It consists mostly of single tools for replacement, but several small lists have recently been received and are now being figured on. The automobile industry is showing more interest in the market, and lists are being prepared by the Chrysler Motor Co., at Walkerville, Ont., for equipment for a new plant. Other business of a like nature is in prospect. Demand for wood-working tools and equipment is also expanding.

Officials of Chrysler Motor Co., which recently purchased a 70-acre site at Walkerville, Ont., where it will start work immediately on erection of a \$1,500,000 plant, state that this will be first of three such units contemplated for company's expansion in Canada. Construction work on first unit will be started within a few weeks. Five-story block of new unit will be 100 x 1000 ft., and motor plant, 280 x 1000 ft.; a loading dock, 60 x 450 ft., will also be included in initial work.

Cozens Spring Service, 2 Wood Street, Toronto, has started work on a new manufacturing plant to cost \$55,000, for pro-

duction and repair of automobile springs, etc.

Mississippi Iron Works, Almonte, Ont., is moving its business to Hull, Que., where it is establishing a plant to manufacture agricultural implements. Company will in future be known as Hull Implement Co. A. K. MacLean, formerly with Massey-Harris Co., is managing director of Hull works.

Town of Capreol, Ont., contemplates spending \$150,000 on sewage disposal system, of which \$30,000 will be required for pump house and equipment. James, Proctor & Redfern, Ltd., Excelsior Life Building, Toronto, is engineer.

Fairchild Aviation Co., Grand Mere, Que., contemplates establishment of local plant to manufacture airplanes, etc., to cost \$500,000.

B. J. Coghlin Co., Ltd., 2050 Ontario Street East, Montreal, manufacturer of railroad and automobile springs, bumpers, etc., will start work at once on an addition to its plant. Dakin Construction Co., Ltd., 270 Beaumont Street, has general contract. Equipment not yet been purchased.

Rideau Power Co. will rebuild its plant at Merrickville, Ont., to replace power plant recently destroyed by fire.

Canadian Rail & Harbor Terminals, Ltd., foot of York Street, Toronto, contemplates erection of a grain elevator at Meaford, Ont., to cost \$500,000 and to have capacity of 1,000,000 bu. C. D. Howe & Co., Whalen Building, Port Arthur, Ont., are engineers.

Western Canada

Bids will be called soon by Victoria Cold Storage & Terminal Warehouse Co., Ltd., Victoria, B. C., for two buildings and power plant units, also for equipment for operating \$500,000 Ogden Point cold storage plant.

Western Steel Products, Ltd., St. Boniface, Man., contemplates building an addition, 100 x 100 ft., to its Regina, Sask., plant.

Poole Construction Co., Hamilton and Eighth Streets, Regina, Sask., have received contract for a \$200,000 factory at Lorne and Fourth Streets, for Canadian Industries, Ltd., head office, Toronto, Ont.

Municipal authorities, Chilliwack, B. C., are asking for prices and information on rock crushing equipment for road building.

Gillespie Grain Co., Edmonton, Alta., is contemplating building a local grain elevator to cost \$350,000.

Milwaukee

MILWAUKEE, Nov. 5.—The matter of production remains probably the most important problem confronting machine-tool builders. Skilled machinists are still very scarce and it is difficult in many instances, to make prompt deliveries. New business is of good proportions, although present demand is hardly as active as a month or two ago. Inquiry is also good and it is believed that sufficient new business will develop to sustain the high rate of production well into the new year. Many lines are represented in current bookings.

National Enameling & Stamping Co., 909 St. Paul Avenue, Milwaukee, is reconstructing a two-story building, 57 x 110 ft., into a manufacturing addition at an estimated cost of \$45,000, including equipment. Siebert & Kegler, 230 Wisconsin Avenue, local, are architects.

People's Ice & Fuel Co., Second and

Division Streets, LaCrosse, Wis., is having plans made for a new artificial ice plant and storage house with daily capacity of 150 tons. Work will begin shortly after Jan. 1. New ice and refrigerating machinery, engines, etc., will be required.

Gugler Lithographic Co., 687 Milwaukee Street, Milwaukee, has plans by Eric Gugler, architect, 101 Park Avenue, New York, for six additional stories, 60 x 123 ft., on two-story building. New press equipment, motors, two elevators are among requirements. Construction work will begin about Dec. 1.

Federal Rubber Co., Cudahy, has placed general contract with Thomas Siderits Construction Co., 306 North Avenue, Milwaukee, for a one-story manufacturing addition to cost about \$85,000.

Hicks Printing Co., Otter and State Streets, Oshkosh, Wis., publisher of *Daily Northwestern*, has engaged Euler & Jensen, local architects, to design its new plant to cost about \$135,000. It is expected to start work about Jan. 15. Oscar J. Hardy is president.

Edgar T. Ward's Sons Co. has completed a new warehouse at Milwaukee in West Allis manufacturing district. Fred O'Dell is in charge as branch manager.

Foreign

OFFICIALS of Allmanna Svenska Elektriska A. B., Vasteras, Sweden, manufacturer of electrical machinery,

have formed Svenska Elektrokonsessionen, a subsidiary, with capital of 10,000,000 krona (about \$2,500,000), to take over and expand a plant at Yaroslav, Russia, to manufacture electric equipment, to operate under an agreement between parent company and Soviet Russian Government.

Ilseder Steel Corporation (Ilseder Hutte), Berlin Germany, manufacturer of structural shapes and other steel products, is disposing of a bond issue of \$10,000,000 in United States, part of proceeds to be used for extensions and improvements. J. Fromme and Ewald Hecker are managing directors.

Department of Public Works, Lima, Peru, has approved construction of new railroad from Yurimaguas east to Pacific Ocean, to cost \$30,000,000 with car and locomotive shops, signal systems, rolling stock, etc.

Officials of Victor Talking Machine Co., Camden, N. J., have organized Victor Talking Machine Co. of Chile, Inc., a subsidiary, with capital of \$208,000, to construct and operate a new plant in Chile.

International Telephone & Telegraph Corporation, 67 Broad Street, New York, has secured a concession from Government of Chile for its recently formed subsidiary, Compania Internacional de Radio, to construct and operate radio receiving and broadcasting stations in that country and other plants and facilities for international wireless service, telegraph and telephone.

New Trade Publications

Nickel Steel.—International Nickel Co., New York. A 12-page pamphlet describing the use of nickel steel in the "Wasp" and "Hornet" aircraft engines built by the Pratt & Whitney Co., Hartford, Conn. Is fully illustrated.

Semi-Diesel Oil Engines.—Chicago Pneumatic Tool Co., 6 East Forty-fourth Street, New York. Bulletin 773 of 12 pages illustrates and describes a class of horizontal straight-line oil engines of 30 to 100 b.h.p. Details of construction are shown, and some sectional views.

Blowers and Gas Pumps.—Connersville Blower Co., Connersville, Ind. Bulletin 25 of six pages illustrates and describes rotary positive blowers with capacities from 400 to 15,000 cu. ft. a minute and pressures up to 12 lb. on the sq. in.

Wedge Nuts.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2114 of eight pages shows a method of attaching electrical and other fixtures by means of a wedge nut pulled tight by the action of the bolt.

Design of Welded Machine Parts.—Lincoln Electric Co., Cleveland. 32-page supplement to the booklet "Arc Welding" giving pointers on how to begin the application of welding in manufacturing machines and equipment.

Long-Distance Transmitting and Recording.—Bristol Co., Waterbury, Conn. Catalog 1900 of 24 pages is accompanied by price list of six pages. It illustrates and describes equipment for centralized control with electrical transmitting and recording equipment, depicting conditions at one or more

distant points. The system operates on the induction balance principle, which is explained in the catalog.

Seamless Steel Tubes.—Pittsburgh Steel Products Co., Pittsburgh. Booklet of 16 pages, "A Quarter Century of Progress," tells the story of steel tubes made by the seamless process to the extent of about 20,000 tons a month. The list of uses runs to about 140 in number.

Centrifugal Pumps.—Aldrich Pump Co., Allentown, Pa. Data No. 71 of 12 pages show a number of types of multi-stage single-suction centrifugal pumps, with performance curves and specifications. Both sectional and installation views are given.

Rolled Anodes.—Taunton-New Bedford Copper Co., Taunton, Mass. Four-page folder describing Eagle brand flat and curved anodes for a variety of purposes, and setting forth their advantages.

Handy Book of Silver Solder.—Handy & Harmon, 57 William Street, New York. 20-page booklet describing the properties of twelve commercial silver solders, their uses in fabricating copper, brass, monel, stainless, and sterling articles, and the technique of soldering.

Electric Heat in General Electric Factories.—General Electric Co., Schenectady, N. Y. A handsome 32-page booklet describing 25 different classes of furnaces, ovens and melting pots used in the manufacture of electrical machinery and devices, all using current for the heating medium. Perhaps the largest is a car-type annealing furnace 28 x 16 x 9 ft., and the smallest is a glue pot.

THE IRON AGE

New York, November 15, 1928

ESTABLISHED 1855

VOL. 122, No. 20

Aircraft Industry In and Near Philadelphia

BY HORACE C. KNERR*

At the banquet of the American Society for Steel Treating held in connection with the National Metals Exposition in Philadelphia, the aircraft industry was prominently featured. This was of two-fold significance: first, that the construction of aircraft is rapidly becoming one of the foremost industries, and second, that it is becoming a metal working industry.

During the year 1927 the number of airplanes made in this country was less than 2000, including those for Army, United States Air Mail, Navy, and commercial requirements. It has been estimated that during the present year the production will be approximately 15,000 planes, an increase of seven and one-half times. While the tonnage of metal now used in airplanes and airships is small, and perhaps never will compare with that now used in automobiles, it is nevertheless important.

One prominent manufacturer of high-grade alloy steels estimates sales of about 5000 tons for aircraft consumption during the year. This, at the conservative figure of 10 cents per pound, represents business of \$1,000,000 for one company alone. Seamless steel tubing is today the principal material of construction for aircraft. One manufacturer of seamless tubing in the Philadelphia district is at the present time producing well over half a million feet per month for the aircraft industry, or about 7,000,000 ft.

*Consulting metallurgical engineer, 538 East Washington Lane, Philadelphia.

a year, and the plant is being enlarged to a 10,000,000-ft. capacity.

Two leading manufacturers are each turning out aircraft engines valued at from \$3,000 to \$8,000 apiece at the rate of 100 to 150 per month. This figures to approximately a million dollars monthly. The welding industry has also found a surprisingly large outlet to aircraft manufacturers, due principally to the development of the welded fuselage.

Large requirements of more ordinary tonnage steel, as distinguished in price and quality from that used in the actual flying machines, are found in shops, machinery and hangars, together with other such ground facilities as beacons and accessory landing field equipment.

Aluminum alloys of high strength, both cast and wrought (the latter of the duralumin type), had their original application in aircraft construction. Their field of usefulness has now extended to automobiles, railroads and other lines, totalling a considerable tonnage.

Philadelphia, long known as the "workshop of the world," has a prominent place in the aircraft industry. Its geographical position is approximately in line with both east-and-west and north-and-south air mail routes. There are 20 landing fields within 40 miles of the center of the city, about half of them being inside or close to the city limits. Several of these are located closer to the business section than in other large centers. The all-year-round weather conditions for both land and water flying, are better than in many aviation centers further west or north.

A flying field that will rival in size and accommodations the famous landing fields in Europe—such as Croydon of

London, Le Bourget of Paris or Tempelhofer of Berlin—is to be established within twelve minutes by automobile from City Hall, at the Camden terminal of the Delaware river bridge. This new field will be known as “Central Airport”. It will cover a site of 175 acres and will have four runways, each 2500 ft. in length.

At the Philadelphia Navy Yard is the famed naval aircraft factory which was the center of the Navy’s production of both heavier-than-air and lighter-than-air craft during the war. This great plant is now devoted to research, testing and development. Within a half hour’s flying distance is the naval air station at Lakehurst, the home of the Los Angeles and the journey’s end of the Graf Zeppelin. At Bristol, a few miles outside the city limits, are the works of the Keystone Aircraft Corporation, manufacturing large planes of the bomber type for the Army as well as many commercial craft.

On the city’s border at Bryn Athyn is also the factory and test field of the Pitcairn Aviation Co., part of whose plant is shown in the head piece of this article. This concern operates the air mail from New York to Alabama

preliminary training course in aviation. Graduates are in line to enter the regular naval flying courses and to become officers in the naval aviation reserve. Here also is the course in heat-treatment and metallography of steel conducted under the auspices of the Philadelphia chapter of the American Society for Steel Treating, many of whose students are employees of plants which are identified in one way or another with the aircraft industry. The high quality of this work was officially recognized by the national society at the recent convention when President Hughes awarded the “president’s bell” to the Philadelphia chapter for its energy in initiating and sponsoring this educational effort.

Mushet Steel Made the First Alloy Tools

A HIGH-CARBON manganese-tungsten steel was developed about 1868 by an Englishman, Robert F. Mushet. Whereas steels known before that time required rapid quenching from a high heat in order to become hard, Mushet’s steel was excessively hard after air cooling and

*H*ORACE C. KNERR was graduated in electrical engineering at University of Pennsylvania, 1910. After some routine laboratory work and steel inspection he joined the Naval Aircraft Factory staff early in 1916. From 1918 to 1925 he was chief metallurgist—a period during which the rigid airship Shenandoah was constructed. Since 1925 he has been practicing as consulting metallurgical and aeronautical engineer. He is an active member of the American Society for Steel Treating, and is largely responsible for the educational course jointly sponsored by the society and Temple University. (Photo Copyright by Bachrach)

and manufactures the planes for this service as well as those used on five other air mail lines, together with planes for commercial and private use.

A few miles from Philadelphia, near Wilmington, is the new factory of the Bellanca Aircraft Co., which is now undertaking a production program of 300 six-passenger planes for commercial purposes. Its flying field adjoins the Delaware River, covers more than 300 acres, and affords all necessary land and water landing facilities.

Various producers of materials, parts, accessories and service used in aircraft are located in and about Philadelphia. At Bridgeport, Pa., 16 miles from the city, is the plant of the Summerill Tubing Co., an entire section of whose mills has been devoted to the production of seamless tubing for aircraft, both in mild carbon steel and in chrome-molybdenum steel. To cope with the increasing demand (which exists in all lines of aircraft construction) a new mill is now being erected by this organization.

Steels and other alloys used in aircraft are necessarily of the highest type, requiring heat treatment under close technical control. The size and shape of many fabricated parts are such as to call for delicate manipulation. To provide such service Metallurgical Laboratories, Inc., has installed complete testing and laboratory facilities, and specially designed furnaces capable of heat-treating not only the numerous small parts and fittings of aircraft, but also engine parts of steel or aluminum alloys, axles, struts and the long wing beams, or spars of alloy steel tubing which are now used by leading aircraft manufacturers.

The Navy Department conducts at Temple University a

retained that hardness even after high tempering. For these reasons it was called “natural” or “air-hardening” or “self-hardening” steel, and in time came to be used for machine tools for cutting the harder steels and cast irons. Owing to the lack of uniform ferroalloys needed in the manufacture, these early high-alloy steels varied in chemical composition between the following approximate figures:

Carbon	1.85 to 2.15
Manganese	2.5 to 1.5
Tungsten	9.0 to 5.5

Other air-hardening tool steels introduced to compete with Mushet steel without infringement on the patent rights were lower in carbon, contained a few per cent of chromium, or substituted molybdenum for the tungsten. Such steels formed the basis of experimentation which led F. W. Taylor and Maunsel White to discover the distinctive heat treatment which induced the quality of red-hardness in tungsten-chromium steels. What is now known as “high-speed” steel is a later development.

Present day representatives of Mushet steel are the “fast-finishing” steels, an inexpensive quality of tool steels for cutting hard metal. A typical analysis contains 1.25 per cent carbon, 0.30 manganese, 3.5 tungsten and 0.3 chromium.

Work benches in a number of plants in San Francisco are covered with ½-in. steel plate. The workmen may hammer on the top of the bench without denting the wood. At the plant of the Howard Automobile Co. the legs of the steel covered work benches are of cast iron.

Non-Destructive Detection of Flaws

Hidden Fissures in Rails Located and Measured by Electrical Methods—Process May Be Used on Track in Service

BY ELMER A. SPERRY*

TO cause a bar or rail by non-destructive methods to "cough up all the skeletons in its closet," or its internal physical condition, it must of necessity be subjected to intense energization. Both alternating current and magnetism are forced completely out, owing to their energization being confined to a skin effect. It is not possible to reach the interior of any structure by either of these methods.

Direct magnetism or direct current are the only methods remaining. The rail user has compelled the rolling mills to produce rails progressively harder and harder until the present-day rail, of very high-carbon steel, is so hard that practically no tool of ordinary high-speed steel will effectively machine it. Permeability of steel always bears an inverse ratio to the hardness factor. Hard steel is thus of very low permeability and some heat-treated and quenched manganese steels even fall to practically zero magnetic permeability. Since for most purposes a heavy energization throughout the whole area is required, this at once puts these feeble magnetic flux densities out of the picture.

We are therefore left with only one of our four possible energizations—direct current. This has the great advantage of not being limited by any law of saturation, simply obeying Ohm's law. Hence there is no practical limit to the amount of current that can be put through the conductor, especially in the short time necessary to make the inspection. This has another advantage, allowing us to secure any character of result required. Through varying the energization it is possible to make a wide range of determi-

tions. So the plan developed incorporated means to this end, completely neutralizing all such variations, regardless of their magnitude, and preventing them from reaching the interpretive portion of the equipment. Thereby the exploration method itself was confined to exact conformity with the interior characteristics. This was found comparatively easy to accomplish, and may be illustrated by one method.

The main primary energizing current is made to traverse the rail, or a section thereof, as by main brushes in contact with the track. Intermediate between these brushes are three searching brushes 11, 12 and 13, shown in diagram. These are connected to two opposite primary coils 22 and 23, constituting the primary of a transformer 24. These coils are oppositely wound and produce opposite magnetic excitation of the transformer. All variations in the primary current will be picked up by the two outer

Method of Relaying Indications from Rail to Instruments, Through Transformer 24

Eleven Fissures Were Located in This 105-Lb. Rail, as Indicated. The numbers tell, by the extent of their divergence, the approximate size of flaw

nations, including the different molecular characteristics of the specimen as well as the soundness of the steel as to cracks, flaws, inclusions and other physical imperfections. This of course extends to all non-magnetic conductors as well.

Uniform distribution of the primary energization throughout the mass is completely secured by using direct current, so that, no matter where the flaw or irregularity exists in the interior of the structure, it is reached completely and its detection made possible.

Avoiding Extraneous Disturbing Elements

One difficulty immediately foreseen was that of neutralizing inevitable variations, large or small, in the primary or energizing current, and thereby preventing false indica-

brushes and thus be completely neutralized as to their influence on the secondary 25.

But, in passing along the track, when a fissure occurs between one end brush and the middle brush, the first coil 22 will become excited to a greater extent than the other. The transformer will become active and in the secondary will be induced half, say the positive side, of a sine wave curve. In the next instant the fissure passes between the middle and the rear brushes, giving an opposite excitation to the secondary, completing the alternating wave by adding the negative side. We now have a true alternating wave. This wave then passes to the amplifiers and may be examined as to both its magnitude and characteristics.

A call was sent out for pieces of rail that had broken in service. Three rails came, two from one road and one from another, where the transverse fissures had grown until the rails had broken in service. When 2000 amperes was put through these rails it was found that one piece

*President Sperry Gyroscope Co., Brooklyn, and President-elect of the American Society of Mechanical Engineers. This is an abstract of a paper delivered by Mr. Sperry on Oct. 26, at New York, before the American Iron and Steel Institute.

was entirely free from even minute hidden flaws. The second had one large flaw—transverse fissure—which had not come to the surface and was completely hidden. The

rails showed absolute soundness and freedom from any internal imperfections.

As the railroad officials, not satisfied with this finding, felt that they were correct in their assumption of fissures in this group, certain rails were selected, the webs burned off and the heads completely broken up into small pieces with a steam hammer. The breaking was not shearing in any sense and was of such a character that, had there been any fissures, they would have located the break. Each fracture was examined carefully on both faces and the rails showed the finest possible steel structure with complete homogeneity.

First Transverse Fissure (Above) Ever Apprehended by the Electrical Method

Five of the Eleven Fissures Spotted by the Instrument in a 105-Lb. Rail

Horizontal Fissures Located by the Electrical Method (Lower Right)

third piece of rail, some 15 ft. long, contained no less than 11 transverse fissures.

In ascertaining the importance of these fissures, we had a blue print made showing both their size and location in the rail. Then the Rail Committee came to the laboratory, whereupon we broke these rails up and with 100 per cent results. One illustration shows the first transverse fissure ever apprehended by the electrical method, which may some day be of historic importance. A sketch shows the exact locations determined for these 11 fissures. Another view shows the appearance of five of the 11 fissures found in the rail. The smallest one, at *D*, was only 1.37 per cent of the area of the head of the rail

Since that time the method has been used on about 80 rails furnished to the laboratory from various roads in the United States. Many of these were perfectly sound and gave not the slightest indication of anything but the finest continuous and homogeneous structure throughout. But in the others about 40 fissures were located. Upon breaking these rails the flaws were found exactly where the apparatus indicated, and none of these gave the slightest superficial indication as to either their size or location, with the exception of two only, which had come to the surface.

On one shipment of 15 rails, all of which had broken in service, the railroad was sure that a number of other fissures existed. Upon examination they were found perfectly homogeneous and without even the smallest fissure or flaw being indicated. The process was intensified so as to apprehend easily a flaw equal to $\frac{1}{2}$ per cent, but the

We have had no trouble in locating some horizontal fissures such, for instance, as one illustrated.

Can Tell Size as Well as Place

Positive indication is afforded not only of the exact location of the fissure but also its size. The uniformity of potential drop which exists at all other points of the rail is interrupted at a fissure. Although the disturbance is minute, through the amplification it is brought up to usable magnitudes to operate indicators or recorders, paint spray, etc.

In a sound rail the direction of current flow is axial unless disturbed. The slightest disturbance changes this alinement of flow and means have been found to utilize this deviation, both as to angle and magnitude of the mean axial departure, for giving an accurate interpretation of the cause, especially when all elements are magnified to be recognizable. Thus the size, characteristic and exact loca-

tion of the fissure or other flaw are accurately determined. This latter method has an advantage over the first, as the indications and determinations are all realized without physical contact with the surface of the rail or other metallic conductor being investigated.

Testing 1000 Rails at Mill

In the laboratory it was found possible so to increase the sensitivity and responsiveness of this last-named method as to get an accurate record of the soundness of

Brush Arrangement Under Car. The paint gun shows in center. Just left of it is a set of copper brushes; another set is at right of center

the rail down to a flaw or defect representing less than 0.1 per cent of the area of the head of the rail. It is important that this is found equally true with non-ferrous metals. A complete set of apparatus was devised and taken to one of the largest rail mills and there set up and employed in investigating 1000 39-ft. rails varying from 90 to 130 lb. section. These rails had passed a most rigid inspection before being submitted to the process.

Rail after rail was passed through the process, showing a perfectly straight line and complete soundness of structure. The entire batch of rails was remarkably free from defects, but such defects as existed were invariably picked up and recorded by the process, both as to magnitude and position in the rail. Many of these proved to be surface abrasions and defects which were not looked upon by the inspectors as objectionable, but the interesting feature is that all were located and recorded. Many "roll-ins" and head seams or surface cracks were found, which had escaped the inspectors' observation but were invariably located and recorded; thus and thus only were they brought under the observation of an inspector.

Although the rails had been handled repeatedly by a magnetic lifter, and although this had been greatly accentuated in some rails, to ascertain the result, the accuracy of the inspection process was not affected thereby. It was found that heat-treated rails could be searched as well as normal rails. A high-manganese rail that had been heat treated and was non-magnetic was put through the process, with a high degree of accuracy.

Rails developing fissures after being only a short time in service are in the majority of instances found associated with shatter zones. Now that these zones can be so completely located and recorded by the non-destructive method, it might be wise to eliminate rails containing such defects from main track, especially where the traffic is dense, and utilize them in less important positions.

Finding Fissures in Busy Tracks

Referring now to the inspection of rails in track, the car as it is now operated on the roads of members of the American Railway Engineering Association consists of a standard track maintenance trailer car upon which is built

an inclosure containing the power plant, radio apparatus and recording mechanism. A motor car is required for towing purposes; the operating speed is 5 miles an hour or more. The power plant placed on the forward end of the platform includes a 25-hp. gas engine with necessary starter and auxiliaries, directly connected to a 4000-ampere, 2-volt generator operating at 900 r.p.m.

One illustration shows the contact brushes which go on the top surface of the rail, and between which flows the energizing current. Each contact assembly consists of eight individual copper brushes, pressed against the rail head by springs. These brushes are mounted in a rigid frame which is raised and lowered by a lever in the car. There are two sets of eight brushes in contact with each line of rails.

Small potential brushes, or equivalent searching equipment, are mounted between the brushes and form the mechanism for picking up the difference in potential from the resistance effect of the air gap at the internal break in the rail head. This micro-voltage is carried to a set of four radio tubes which step it up 200,000 to 300,000 times.

Near the center of the cut the paint spraying device can be seen. A relay controls the release of a spray of paint against the side of the rail whenever a defect is found at any point in its length.

How the Permanent Records Are Made

Above the table containing the necessary batteries for the tubes is shown the suspended aluminum case containing the amplifiers. On the table are the relays, ten being required for various purposes. On top of the recording table travels a friction-driven moving strip of paper. In contact with the paper are seven pens which are actuated by the relays in circuit with the tubes.

Fissures located in one line of rails are indicated on the paper by three pens, and a similar set of pens for the opposite line of rails. The center pen records location of joints. The relays are so adjusted that a short transverse line is drawn by one pen if the internal break is of small area; two pens operate if the break is of intermediate size

Recording Table, Showing Seven Pen-Drawn Lines at Left and Rail Numbers at Right. Nicks on the lines tell conditions in the rails

and all three pens if of large area. The fissure pens are automatically thrown out of circuit when the pen for location of joints operates.

The three lines to the left record defects in the left-hand rail; the middle line locates the joints; the three right-hand lines indicate defects in the right-hand line of rails. The short transverse lines thus permanently record the location of internal breaks and their size or area. A numbering machine also conveniently identifies each rail on the record, while the paint spray notifies the trackmen of the existence and location of defective rails.

Rotary scratch brushes, not illustrated, are set ahead of the front contact brushes and remove rust or foreign material from the running surface of the rail to insure good contact for the contact brushes. A buzzer or horn placed in the car operates by a relay to notify the operator, and as a further check on the proper functioning of the apparatus.

Instruments Sensitive But Under Control

It is found possible to bring the apparatus easily into such adjustment that, unless discontinuities exist in the rail head, there is not the slightest indication by either the indicator or recording pens, showing that the rails are structurally sound and normal. The apparatus is also found susceptible of such adjustments as will bring in other characteristics outside of discontinuities, in cases where such indications are found desirable.

Ten Relay Sets on Table, with Amplifiers in the Suspended Aluminum Cases. The batteries for energizing the tubes are placed beneath the table

Comparing this method with the old destructive method of discovering hidden fissures or discontinuities, experience has shown that defects, especially of this class, are revealed much more accurately and more reliably by the electrical method. The following incident illustrates this very clearly: Record was made of a hidden fault constituting a fissure or crack of some considerable magnitude. On repeated searchings in the same region of this rail the records were absolutely consistent, both as to magnitude and location.

This piece of rail was cut out and the regular standard destructive method was proceeded with at a well established laboratory, but grinding and etching failed to reveal anything photographically or by the microscope. The sample was finally virtually abandoned by the laboratory as containing no flaw. However, knowing by our electric process that a definite and quite serious fault actually existed at this point, we urged that the sample be re-etched by using the strongest possible re-agents procurable. This was done, whereupon the microscope revealed a transverse crack or crevice about $1\frac{1}{4}$ in. long exactly at the point electrically indicated.

Seasoning Rails by Electricity

A by-product of the electrical method has an interesting bearing on improving the quality of the rail. There have been instances in mills where "aging" or "seasoning" was necessary to bring the rails up to the point where they

would fulfill specified test requirements. We have noticed that, under our standard current densities, the temperature of the rails has always risen. This temperature rise comes from within, in contrast with the usual method of heating from without. Also the electrical saturation is invariably accompanied by a phenomenon which is nothing short of a positive and most striking molecular realignment and readjustment, constituting vigorous magnetic radiations from the innermost portions outwardly. It therefore cannot but have a beneficial aging and positive strain-releasing influence.

Thus an effect equivalent to the aging of weeks and even months may be concentrated into minutes or seconds, bringing the rails up to a higher standard of test qualification and general usefulness by this artificial internal molecular release and adjustment. We have already in hand sufficient data to state positively that an important

gain of this character is definitely secured as a by-product of this electrical inspection process.

With the detector car it becomes possible to sweep tracks free from the aggravating menace of transverse fissures. About 5000 rails were broken last year, through fissures having grown to the extent of causing the failure of the rails in service. The present practice is to remove the entire heat, at heavy cost, from the road where these fissures are repeated, this being mandatory in some States. Our experience up to the present in searching a large number of rails, and ascertaining about the percentage of fissures existing, indicates that the lifting of these heats is altogether too radical a demand. Probably between 90 and 95 per cent of the rails so lifted are perfectly sound and should be untouched and remain in the roadbed, thus making possible a definite saving to the railroads by the use of the car.

The value of the recovery of eight non-ferrous metals from secondary sources in 1927 was \$256,352,000 as against \$274,540,900 in 1926, reflecting a decrease of \$18,188,900, according to reports made to the Bureau of Mines. J. P. Dunlop, who compiled the figures, said the decrease in total value was due to a lower yearly average price of all the metals covered in the report, other than nickel, for the total recoveries were about 11,000 tons more than in 1926. The metals included in the report are copper, brass, lead, zinc, tin, antimony, aluminum and nickel.

Several Methods of Gating Molds

Multiple Pencil Gates for Thin Castings—Explanation of Use of Equalizing Gates

BY PAUL R. RAMP*

TO the discussion of many of the simpler forms of gates in molds, covered in *THE IRON AGE* of Oct. 18 and Nov. 1, a description of other special types of gates is here added. In particular, the use of pencil gates, in considerable numbers to the mold, is taken up, and their utility and limitations are shown. Equalizing gates, for intricate castings, are found to overcome previous troubles and to be very much worth while.

Pencil Gates on Cylindrical Castings

IN making cylindrical castings that must be particularly clean, such as paper rolls, pump plungers and many other articles, it is advisable to pour these castings on end. One illustration is a cross-section of a cylinder mold. At the right are shown the drag mold, cheek mold, cope mold and the pouring and runner basin, all in a vertical section. The plan of the pouring and runner basin shows the small pencil gates, indicated by *LLL*. A partial cross-section of this mold shows it partly filled with metal, the metal falling into the mold being indicated by the arrows marked *L*.

Referring again to the vertical section, the metal is poured from the ladle into the pouring basin *A*, and immediately fills the runner basin, which must be kept full until pouring is completed. The metal flows from the bottom of the runner basin through the small pencil gates and enters the mold at *C-C*, dropping to the bottom of the mold at *E*. This pouring is continued until the mold is full.

To provide for a riser or feeding head on a casting of this character, the mold is extended several inches at the end of the casting proper, which in this case is shown at the flange indicated by *D*. The depth of this riser must vary according to the volume of metal required to fill the mold and the length of the casting. The excess metal required to form the riser or feeding head can be cut off in the machine shop.

Another illustration of how the metal enters the pouring basin *A* and flows into the runner and into the pencil gates *L* is afforded by the plan. The view at the lower left

shows why a pencil gate is more effective than a bottom gate for a casting of this kind.

When a mold is being filled with metal, any impurities that may find their way into the mold, or may already be there, float on the top with rising metal. They continue to rise with the metal unless they come in contact with the walls of the mold. In such a case they cease to flow upward with the metal and cling to the mold surface, regardless of how much metal flows by, unless some agitation is produced to dislodge them.

This plan of pouring dislodges any impurities that may cling to the side of the mold, and continues to dislodge them, regardless of how many times in their upward movement they may come in contact with the mold surface. This is accomplished by action of the metal dropping through the pencil gates, where each stream of metal strikes the body of metal that has preceded it, and an unusual agitation is created. The illustration is an attempt to show visually the effect of these numerous streams of metal on the body of metal in the lower part of the mold. The continual agitation on the surface of the metal persists until the mold is filled, thus automatically dislodging any impurities inclined to cling to the mold surface. This makes it possible for them to be carried to the top of the mold, into the feeding head section, where they will do no harm.

Pencil Gates on Pipe Castings

PENCIL gates on cylindrical castings are such important devices that a method of using them on pipe castings will be described. These castings are pipes 20 in. in diameter and $\frac{1}{4}$ in. thick. To prevent the casting from cracking, a green sand core is used; if a dry sand core were used the casting would crack in cooling. This pipe cannot be poured on end, as shown in the other case, because then the pressure at the lower end would be too great on a green sand core. As a result, instead of being $\frac{1}{4}$ in. thick, it might be three times that, owing to the fact that the green sand core could not withstand this pressure.

If the green sand core were to be rammed hard enough to retain its original shape, the metal would not lay to it,

*Superintendent of foundry and pattern shop, Newport News Shipbuilding & Dry Dock Co., Newport News, Va.

Use of Pencil Gates C D on Thin Pipe Cast Horizontally, Two Rows of Gates Being Used, Fed from a Common Runner

but would cut the core badly and produce sand holes as well as blow holes. For this reason the pipe is molded in a horizontal position and gated with two rows of pencil gates, along the upper surface of the mold. The pencil gates used in a case of this kind are as small as possible, but, of course, must be large enough to prevent the metal from chilling in its journey from the runner to the mold.

Pencil gates are shown in both views. The metal is poured into the two basins indicated by *BB* as quickly as possible, so as to fill the basin before any impurities can find their way into the pencil gates at the points indicated by *CCC*.

It is usual practice to use two ladles that will carry enough metal to fill the runner, and to make the runner large enough to hold sufficient metal to fill the mold. When this is done the pouring operation is simply a question of dumping both ladles into the basin as quickly as possible, and letting the metal flow through the pencil gates into the

An example of the use of an equalizing gate is shown in the cross-section of a locomotive cylinder mold. This sketch is not taken from any definite blueprint, but is drawn from memory to illustrate the use of the equalizing gate.

In this case the metal, poured into the runner basin at *A*, flows through the down gate and into the mold at *C*. From this point it flows around the exhaust core and fills the saddle portion of the mold *JJ*. When the saddle is filled the metal rises to level *DD* and, if no equalizing gate is used, when the metal reaches the point in the mold indicated by *H* it does not travel upward any more, but remains stationary until enough metal has flown over this high point of the mold to fill the piston valve section up to *DDD*. After this, all of the metal in the mold begins to rise until the mold is filled. Although the metal may be very hot, and comes up in the risers in a very satisfactory condition, there is grave danger of a cold shut being produced around

mold at *DDD*. Two rows of pencil gates should be used on a mold of this kind.

This plan of gating a very thin casting is superior to trying to gate it on the joint of the mold, as gravity assists the flow of the metal from the time it enters the mold until the cavity is full, and the hottest metal is always on top.

In using gates of this kind in a green sand core the upper portion of the core can rightly be termed a part of the gate arrangement, as the core at this point must be carefully vented with a cinder bed or otherwise, and the proper sand mixture used, and very often surface-nailed at the point where the metal strikes it, or there will be danger of a cut or scab.

Equalizing Gates

AFTER the proper gate is provided for leading the metal to the mold, it is sometimes necessary, owing to the shape of the mold, to consider further how the metal is going to fill the cavity. In many cases what is termed an equalizing gate is necessary, to prevent cold shuts in large, intricate castings.

the exhaust pipes, live steam pipes and other sections at *DD*, because the time this metal remains inactive while the piston valve section is being filled is long enough to allow a crust of cold metal to form over its surface at *DD*. When all of the metal has reached the height indicated by *D*, and once more starts upward, it does not carry this crust with it, and in very few cases does it fuse it, but flows around it. In consequence a cold shut or division of metal is produced in the casting at this point, and the result is a leaky steam passage.

The remedy for this is the equalizing gate shown at *F*. When the metal enters the mold at *C*, and as soon as the saddle portion of the mold has been filled, it flows through the equalizing gate into the piston valve section of the mold, and upward as indicated by the arrows. And while the metal will rise slower when the entire mold is being filled, by the use of the equalizing gate it will be continually in motion, traveling upward. Thus the danger of a crust forming over the portion of the metal that remains at a standstill for a short time is eliminated.

There are many molds of this character where the metal is stopped in its upward journey while some lower portion

is being filled. This action invariably creates a cold shut, and an equalizing gate such as described here should be used wherever possible. Many large castings have been found defective because the proper equalizing gates were not provided. In gating a mold of this character, it is good practice to add an additional inlet gate nearer to the upper portion of the mold. This suggested inlet gate, shown at G, is for the purpose of providing hot metal direct to the upper portion of the mold.

General Considerations

There are many more kinds of gates, but the object of this article is merely to give a general idea of the importance of gating molds and a few suggestions of how to make the gates.

In production work there are many special skim gates, and gates in cores, that will be more effective than the hand-made gates described here. But in the foundry jobbing business it is impossible to provide special set gates or core gates for the great variation of work made from

day to day in small lots. Consequently a molder must be competent to make his own gates for each mold he is called upon to produce.

Finally, the important things to observe at all times in gating a mold are:

1—Gates should always be clean and free from loose sand.

2—Gates must be soft enough to keep the metal from cutting into the surface and producing dirt.

3—Gates must not be so soft as to allow the metal to strain into them or cut or wash. In making these gates soft they must be pressed down to the right hardness with the finger or hand on all green sand work, and not slicked with a tool. A slicked surface on a gate for a green sand mold will scale off when the iron flows through it.

4—Gates must be brushed clean with a camel hair brush, and the surface directly over the gate in the cope must be slicked to prevent the loose parting sand adhering to the cope surface of the mold from being washed into the mold by the gate under it.

Aluminum in the Mold Makes Abnormal Steel

SEVERAL automobile manufacturers, led by E. W. Upham of the Chrysler Corporation, united in requesting the Bureau of Standards to investigate the problem of "abnormal" steel, as indicated by the McQuaid-Ehn carburizing test. By reason of the facilities extended by Central Alloy Steel Corporation and Trumbull Steel Co., S. Epstein and H. S. Rawdon of the bureau have been able to reach the conclusion that abnormality is largely due to the method of finishing a heat of steel. Their studies are described in the 44-page Research Paper No. 14, Bureau of Standards, Washington.

The paper starts with a statement of the authenticated properties of normal and abnormal steel. Thus, a normal steel cannot be changed into an abnormal one by cold work or any commercial heat treatment. Hardening in water from salt baths does not prevent soft spots in abnormal steels but quenching in brine does. Normal low manganese carburizing steels do not develop soft spots even after oil quenching.

Results of the McQuaid-Ehn Test

	Normal	Abnormal
Microstructure of case		
Grain size	Usually large	Small
Excess cementite	Well defined network	Coalesced in ferrite
Pearlite	Lamellar	Tends toward spheroidal
Thickness of case	Deeper	Shallow
Izod impact strength		
Normalized	71	79
Coarsened	27	69

That the McQuaid-Ehn test does indicate relative hardenability is proved by tests on 88 pairs of samples quenched in various manners. In only one pair did the abnormal sample show a lower index number of soft spots, as determined by hardness explorations of carburized and quenched samples.

Killed steel can be either normal or abnormal; so can effervescent steel.

Chemical analysis fails to show any connection between the ordinarily reported elements and abnormality. Ehn's opinion was that abnormal steel contains an undue amount of submicroscopic oxides. Not all oxides are potent, as is indicated by tests made from open-hearth metal at various stages during refining. Some heats are abnormal at all times and in the ingot; others are normal at all times and in the ingot; still others are abnormal only until deoxidized.

Spectroscopic analysis shows, however, that if the aluminum content exceeds 0.010 per cent the steel will almost surely be abnormal. Oxygen analyses are not conclusive, because the methods in use do not break up aluminum oxides; Al_2O_3 determined in the residue from abnormal steels is high. It was therefore concluded that aluminum

may be the culprit and some tests were made during the refining and pouring stages in a steel plant. It was found that aluminum or ferrovanadium added to the ingot produced abnormality in both killed and effervescent steel. However, enough aluminum added to the ladle to kill a normal effervescent steel did not produce abnormalities. Ferrosilicon either in ladle or mold does not produce abnormality.

On the basis of these studies, Messrs. Epstein and Rawdon draw the following practical conclusions:

Soft spots in case-hardened articles can be overcome by increasing the quenching rate or by using another type of steel. In any particular plant the trouble can be handled according to the practice, equipment, quality, cost and the personal preference of the metallurgist.

One solution which appears to be a general trend is the use of the alloy carburizing steels which harden uniformly on water quenching, for example, the nickel molybdenum steel used for roller bearings. The special manganese carburizing steels also belong in this class. The former has been called "fine-grained normal" and is preferred to coarse-grained normal steel for the obvious reason that coarse grain is conducive to brittleness. With the "fine-grained normal" steels the "regenerative quench" or "core-refining heat" is often omitted.

When plain carbon steel is still wanted, the metallurgist may specify normal steel to avoid soft spots. Besides being more likely to harden uniformly it has the advantage that it carburizes somewhat faster. A more uniform material may thus be obtained. The use of normal steel is not the only recourse, however. Another metallurgist may decide to depend on more drastic quenching by pressure spray or brine to get uniform hardness. He may even prefer abnormal steel with its fine grain, for the same reasons that the "fine-grained normal" alloy steels are preferred. If tap water is used for quenching, there is danger of getting soft spots in normal steel as well as in abnormal steel, but with brine or other drastic quenching, both types of steel will harden uniformly.

"Normal" and "abnormal" should not be taken as synonymous with "good" and "bad." Even as each type of alloy steel therefore has its particular field and advantages, so also normal and abnormal steel may be preferred, each according to the special conditions in a plant.

The tests indicate that the steel maker ought to be able to produce normal and abnormal steel at will, subject, of course, to the limitations of chemical composition. (It would be hard to produce a coarse-grained vanadium steel, for instance.) Fine grain would be preferable.

Making Electric Heating Appliances

How, for Different Uses, Filled Tubular Elements Are
Annealed or Calorized or Made Part of a Casting

ILLUSTRATIVE of modern practice in the protection against oxidation of tubular forms of electric heating elements is the method developed by the Edison Electric Appliance Co. in the manufacture of electrically heated waffle irons, curling irons, flat irons, toasters, percolators, soldering irons, etc. The wire coils of the resistors are inserted in steel or copper tubes into which is packed magnesium oxide. In the case of flat irons or hot plates for cooking ranges this element is placed in the mold in the foundry and becomes an integral part of the casting. Some of the details of the processes are shown by the accompanying illustrations taken in one of the two Chicago plants of the company, which also has a plant at Ontario, Cal., and which is the outgrowth of a merger of the Hotpoint company, the Hughes company and the appliance division of the General Electric Co. some ten years ago.

The tubes, which range from $\frac{3}{8}$ to $\frac{1}{2}$ in. in diameter, are cut to length in cold cut saws and are counterbored at both ends in centering machines to permit the crimping in of washers to hold the coil inside in suspension. The coils are of nichrome wire, which is formed by winding the wire on motor driven spindles at high speed. They are cut to the proper lengths, which range from 4 to 16 in., according to the type of appliance in which they are to be used.

When a coil is inserted in a tube, a washer is put in one end and a yoke shaped washer slipped into the other to hold the coil in tension and then the assembly is taken to the filler room. Here the assemblies are put into racks hold-

ing 20 at a time with hoppers above and tubes running from the hoppers to the upper ends of the assemblies. These racks are made to vibrate at a high rate by motors and cams which cause the magnesium powder to pack in tightly as it runs in from the hoppers. Full washers are then put in both ends and crimped into place by hand. The magnesium oxide is packed in still more tightly by swaging the tubes in swaging machines which reduces the diameter $\frac{1}{64}$ in.

These units are then annealed in a gas-fired furnace, which is 10 ft. long, 4 ft. wide and 5 ft. high. Built of brick suitably insulated and steel encased this furnace has running through it three nichrome steel tubes about 4 in. in diameter. They extend about 7 ft. beyond one end for a cooling zone. The tubes are plugged at both ends while the work is inside and city gas is forced in, passing through a water seal at a point close to the discharge end to insure a neutral atmosphere. Formerly nitrogen was used. The work is pushed through in bundles, one bundle pushing the preceding one.

Heat is supplied through two gas burners, equipped with inspirators, underfiring the work through one end of the furnace. The gas is supplied at 6 lb. pressure and inspirates the air in the proportion to maintain complete combustion. Only the steel tubes are annealed here and the temperature range is 1400 to 1500 deg. Fahr. The furnace was manufactured by the Surface Combustion Co., Toledo, Ohio.

The waste heat from this furnace is utilized in a drying oven, 10 ft. long and 3 ft. square in cross section.

*Electric Flat-
irons Are Made
Up in Steps from
Station to Station of the
Assembly Bench*

One of the Sub-assembly Departments in Electric Flatiron Manufacture

Prior to assembling the tubes and coils, the former are pickled and then dried in this oven. After annealing the tubes are again cold swaged and reduced another 1/64 in. in diameter. An in-and-out type of furnace is used to anneal miscellaneous stampings, punch press products, etc. This unit is 6 ft. wide, 5 ft. high and 4 ft. deep. It is fired with a burner and inspirator on each side.

The electric heating units are now formed into various shapes for different applications. Some of them are rolled to give a square shape to the tube. For the heavy duty broiler of oven plate a tube about 9 ft. in length is coiled spirally. This type unit is calorized. Those coming in contact with hot water are tinned and the others are incorporated into various appliances without any treatment.

Calorizing in this case consists of dipping into molten tin and then into molten aluminum. For this process two cast

iron pots are supplied, held in place by a brick structure, which has a furnace underneath. This structure is 12 ft. long, 9 ft. wide and 4 ft. deep. The pots are 33 in. long and 30 in. deep, while they taper in width from 12 in. at the top to 4 in. at the bottom. Heat is supplied by four gas burners for each pot, two firing at each end and the flames impinging.

Inspirators are supplied to control the atmosphere for the prolongation of the life of the pots and to supply air to the gas-air mixture in the right proportion to insure perfect combustion and minimize fuel consumption. The elements to be calorized are first dipped in the tin and then into the aluminum. The first is carried at 600 deg. Fahr. and the latter at 1600 deg. This furnace was also designed and built by the Surface Combustion Co.

The calorized elements are now sent to the terminal as-

The Swaged Tubes Containing the Resistance Wires Are Annealed by Passage Through This Tubular Furnace

Permanent Molds, Mounted on a Rotating Fixture, Are Used in Casting the Flatirons

sembly department, where the ends of the tubes are cut off for about a quarter of an inch, leaving the ends of the terminals protruding. Leads are then brazed on, using mica washers to insulate from the tubing. After testing electrically for short circuits, the elements are sent to the stockroom to be drawn for assembly in the various appliances as needed.

As previously stated, these elements are inserted in the foundry molds when, as in flat irons and hot plates, they become a part of the casting. The foundry of this plant is equipped with continuous molding machines which consist of circular frames, about 10 ft. in diameter, mounted horizontally with the floor and rotated by motor. Brackets to

hold the molds are placed on these frames at short intervals.

The molds or dies are in two parts, one stationary and the other movable, to close or open the mold. This opening or closing of the mold is accomplished by cams which operate as the frame rotates. As the molds pass one station they are opened and an operator inserts the elements; they are then closed and the molten iron is poured in at the next station and then they are opened again for the casting to drop out. The iron consists of two castings, the pressure plate and the sole plate, which are later bolted together.

The hot plates are cast on the pouring floor in flasks consisting of a cast iron drag and a sand cope. All elements are preheated before inserting in the molds.

Business Building Has Welded Frame

Designed for Arc-Welded Steel Construction," Upper Carnegie Building in Cleveland Presents Some Unusual Features

WITHOUT a rivet or bolt in its steel framework, the Upper Carnegie Building, Cleveland, is the first commercial store and office building erected by the arc-welding process. In "shop" fabrication and in field erection the members of the structure were fused together at joints by the use of the electric arc. The steel framework is, therefore, actually a one-piece structure.

The building was designed and built by its owners, the Austin Co., Cleveland. The Welding Engineering & Construction Co., Cleveland, acted as consultant and welding

being milled, the columns were set upright on their base plates and attached by welding a continuous bead along the outside edges of the column flanges. Plates were used instead of angles as beam stiffeners. These were welded between the flanges of the continuous beams, where the columns joined the beams. The stiffeners carried the lines of the column flanges through the beams. Where the column flanges were parallel to the webs of the beams, Tee stiffeners were used.

Lattice girders in the front bay of the building carry

Stiffeners Were Welded Between the Flanges of the Continuous Beams at the Column Connections. They carried the lines of the column flanges through the beams. Angles and blocks welded to the bottom of the beams located the flanges and webs of the supporting columns

inspector. The welding was done by the Lincoln Electric Co., Cleveland.

A four-story structure of modern architecture, the building is 60 ft. wide and 119 ft. long. The ground floor is divided into stores, the three upper stories containing offices.

Designed for arc welding, the structure contains unique features of construction which resulted in a saving, in structural steel tonnage, it is stated, of about 15 per cent. The framework exclusive of the welded bar joists contains 115 tons of steel. The most economical riveted design, it was figured, would have required over 130 tons.

All fabrication was done outdoors in the yard of the Bliss Road fabricating plant of the Austin Co. Five welding operators were employed. Five Lincoln "stable-arc" welders of the motor-generator type supplied the welding current. Machines of 300-ampere capacity were used generally, with the 200-ampere size for some work.

In joining the H-columns to their base plates no connecting angles were required. The ends of the columns

the first floor partitions and the store-front bulkhead beams. Such girders permitted installation of concealed piping. With a span of 18 ft. 1 in. and depth of 18 in., they are composed almost entirely of angles, only the verticals at the ends being plates. The members were laid out, held in place by C-clamps and then welded.

As no field bolts were used to hold the members of the structure in place until welded, a novel method of shoring was required. A square frame was bolted around the columns, to provide means for connecting the braces. The column shoring connection, or frame, consisted of two 2 x 2

in. wood blocks held on opposite sides of the column by two bolts connecting them and forming a square. These bolts also held to the wood members angles whose free legs were punched, and through which long bolts were passed. Thus the frame had bolts on four sides, permitting the bracing (2 x 4's and 4 x 4's), which had strap iron hooks at the ends, to hook on to the columns. This hooking arrangement on the braces greatly facilitated the shoring of the free structural members during erection.

As the structure was so designed that every alternate column in the front of the stores can be removed, either 17-ft. or 34-ft. wide store fronts are available at any time along the front of the building. This was made possible by using 36-in. Bethlehem girder beams over the store fronts—one of the first uses of this new size girder beam. The continuous girder over the store fronts was erected in two sections, which were welded together after erection,

in the same manner as were the other continuous beams.

Welded bar joists, used to carry the 2-in. concrete floor and roof slabs, were welded in place to their supporting beams. To give the joists increased lateral stiffness, two 5/8-in. rods, equally spaced in each bay, were laid across the bottom chords of the joists and tack welded to each joist. This increased the rigidity of the joists to a far greater extent than if they were bridged in the usual way with wire.

Where partitions occurred the joists were stiffened by welding a plate the full length of their top chords. The bottom chords of these joists were also continued to the member supporting the joists. This was done by welding angles along the bottom chords and welding the free ends of the angles to the beams. Requirements of clearance rather than structural design dictated this method of stiffening the joists.

Tests for Durability of Zinc Coatings

A RAPID method for appraising the life of zinc-coated materials in industrial atmospheres is described by Edward C. Groesbeck and William A. Tucker in *Bureau of Standards Journal of Research*, August. The well-known salt spray test is, in their opinion, too slow; furthermore, the coating breaks down in a manner which does not correspond to the observed failures in service.

A preferred method is the "simulated atmospheric corrosion test," wherein the specimens are exposed for five hours to an atmosphere containing 94 parts air, 5 parts CO₂, and one part SO₂, saturated with water vapor at 120 deg. Fahr. Thereafter for one hour it is exposed to a spray of clear water, and dried in the open air for at least 18 hr.

Results of Simulated Atmospheric Corrosion Tests. Each point plotted in the diagram is the average value of three determinations

Then a second cycle starts. After several days failure of the zinc coating is clearly shown by red-brown spots of iron rust.

Results of this test for various weights of coatings are shown in the figure. It will be observed that the life increases in a fairly uniform proportion with the thickness of the zinc coating. In all cases the pure zinc at the very surface was removed after a very few cycles, but the underlying layers of iron-zinc compounds proved very resistant to corrosion. Hence a heat treatment which diffused these compounds to the surface increased the life of the coating by approximately 35 per cent (as shown by the dashed line). Imperfect coatings, such as those containing blisters, very small spangles known as "gray galvanized," irregular sized spangles, and stringy coatings have decreased life, as shown by the results plotted by small

triangles and the dotted line. No improvement in life was noted in the galvanized coatings placed on copper bearing steel sheets.

While this new test is not recommended as a substitute for the well-known stripping test for determining the weight and uniformity of the coating, nor the "life" tests designed to expose pinhole or other defects, it is thought by the authors to have promise as a means of appraising quickly for coated articles the relative life which may be expected in industrial localities.

Practical Value of Rockwell Hardness Tester

In a paper on the "Rockwell Hardness Test" before the (British) Institute of Metals, early in September, J. E. Malam, the author, discussed the subject of hardness testing on a purely theoretical basis. His contribution was of interest largely to physicists, and it is now appreciated that a brief extract which was furnished by the institute and published in *THE IRON AGE*, Oct. 25, page 1021, was likely to leave a wrong impression in the light of the scope of the paper. Mr. Malam, as disclosed by a copy of the paper in full, says in part:

"No one will be inclined to underrate the practical value of the Rockwell test. It can be carried out in a fraction of the time occupied by the Brinell test, while such data as are available indicate that, from the point of view of reproducibility of results, it is not inferior to the Brinell test."

New German Coke Car

A new type of coke car is now used for heavy-duty carriage in the Ruhr district by the German Railroad Co. (Deutsche Reichsbahn Gesellschaft), according to the Department of Commerce. These cars are of the automatic side-hopper unloading type, specially designed for carrying coke, and were developed by increasing the length of the standard coal car constructed by the Krupp Works from 10 to 12 meters (32.8 to 39.4 ft.).

These coke cars, constructed of silicon steel, have a carrying capacity of 92 cubic meters, or 55 metric tons (121,250 lb.), weighing when empty 21 metric tons (46,300 lb.). The wheels, equipped with roller bearings, have a diameter of 940 mm. (37 in.). Particular attention was paid to the springs, which are constructed of high-grade steel, to prevent unnecessary wear to tracks and car. The 16 brake blocks on each car are controlled by compressed air, the pressure of each block being automatically balanced by an adjustment device in the brake rods. The cars also have automatic couplers, and haulage friction is reduced by special shock absorbing springs in the bumpers.

Steel Demand Is Sustained

No More Than a Seasonal Let-Up in Consumption Indicated—
No Signs of Overproduction of Steel

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

NO let-up of more than a seasonal character in the country's steel requirements is indicated by the statistics. The composite demand line continues at a high level and well above the current production of steel. Of course, buying may fall off temporarily if consumers have anticipated their requirements, but activity in consuming industries is well sustained and potential current requirements are unabated.

In September, the following consuming lines gained in activity: building, automobile production, mining, machine tools. Railroad freight traffic, manufacturing (other than automobiles and iron and steel) and exports decreased. The net result was a practically unchanged level for the composite demand line. The indications are that October showed a further rise, as railroad traffic and building activity increased considerably last month, and probably more than offset the decline in automobile production.

As steel production, after allowing for seasonal variation and normal growth, held only about level with September, there is no indication of overproduction at present.

As to the future, railroad business seems to be a little better. October freight traffic increased more than

usual, and both crops and industrial output are in large volume. In spite of unsatisfactory rates and high wages, the carriers are likely to show gains in earnings and may be able to make up for some of their postponed maintenance.

As to building activity, the trend of permits and contemplated new construction continues downward, forecasting an ultimate decline in contracts. October contracts, however, gained more than usual for the season, and actual construction promises to continue in good volume for some time. Bookings of structural steel fell off rather sharply in September, and October trade reports indicate the lowest weekly average in several months, but building operations will require a large quantity of steel during the next few months.

Automobile production is rounding off. Some let-up in the consumption of steel by automobile manufacturers is probable. General manufacturing activity, however, continues large and promises well sustained demand for miscellaneous steel products.

The oil industry is doing a little better. It is not really good and is still threatened by overproduction, but earnings have improved and demand for steel from this quarter will

be at least as good as it has been recently.

Farm purchasing power appears to be slightly lower. The total value of the chief crops is about 7 per cent less than a year ago, and lower hog prices are an unfavorable factor.

The net result should be a fairly well sustained demand for steel.

Steel Bookings in Record Volume

ORDERS and sales covering the chief items of finished steel have continued their upward trend. Probably they were the highest in September ever recorded for that month, exceeding even the volume in September, 1926. The third quarter total exceeded even the fourth quarters of 1924 and 1925, and the nine-month total apparently sets a new high record.

A fair seasonal gain occurred in September in the sales of sheets, though the total was much under that for September, 1926. Structural steel sales declined a little more than usual for the month, but were above any recent September figure. Sales of steel castings show notable improvement and made the first September increase since 1924. Sales of castings exceeded

Steel Ingot Production (Adjusted) Showed a Slight Decline in October. Composite demand remained virtually unchanged in September and probably gained in October

production for the first time in several months. Sales of fabricated steel plates showed a decline, but that is usual in September and the amount of decrease was rather less than average.

Our adjusted index of steel ingot production, based on the average daily output, registered 118.8 in October, which compares with 119.2 in September and 89.1 a year ago. This means that steel production was 18.8 per cent above estimated normal and was slightly lower than in September. It is to be remembered that the average

daily ingot output normally increases between 3 and 4 per cent in October.

Allowing for seasonal conditions, the unfilled orders of the Steel Corporation decreased slightly last month, the actual increase of 52,662 tons being a little less than usual. They have thus held about level for four months, considering the season, and are about 13.8 per cent below the average of the years 1923-1927.

The average price of finished steel in October, according to THE IRON AGE figures, was 2.364c. a lb., against 2.351c. in September and 2.314c. in

October, 1927. This is 93.7 per cent of the average for 1923-1927.

We conclude that prices and unfilled orders have tended to increase very slightly and gradually. The two are in normal adjustment, one representing the trend of new business with relation to shipments, the other the market balance between demand and supply. Production of steel is very large, though justified by above-normal demand, and is ample for all requirements. The situation resembles that found in the middle of 1926. Now, as then, a gradual increase in the

Buying of Finished Steel Reached Highest Volume for Any September. Nine-month total also set a new record

Unfilled Orders (Adjusted) and Steel Ingot Output (Adjusted) Both Showed a Slight Decline in October. Gradual upward movement of steel prices expected to continue in November and December

Pig Iron Production (Adjusted) and Prices Continue to Advance. A still higher market is looked for

strength of steel prices is logical. There is no more reason, however, for a runaway market than then. It looks as though there will be no more than a seasonal rounding off of production in November and December, with but little change in unfilled orders, and with prices slightly higher.

Further Strength in Pig Iron Prices Looked For

PIG iron production, even allowing for seasonal variation and the normal growth of the country's requirements, increased sharply in October. Our adjusted index is 113.9 per cent of normal, against 108.5 in September and 99.4 a year ago.

This rate of production is one which in the past has been too large to be maintained for more than a few months, and at which pig iron prices have soon terminated an advance. At present, however, steel production is so high that a large output of pig iron is required. It is also true that pig iron is still low in comparison with steel scrap, so that it can be said that pig iron is relatively cheap.

It therefore seems probable that further strength will develop in the pig iron market during the remainder of the year. Probably overproduction will ultimately occur, and prices will become too high in comparison with steel scrap. In such an event, the pig iron market will decline. This event, however, is not yet in sight and is probably at least three months away. Its coming depends largely on the extent to which steel demand is sustained and on the course of the scrap market.

In general the price structure in the iron and steel industry is in fair balance, the chief maladjustments being the fact that scrap is too high and that finished steel averages a little low, particularly in the case of sheets and nails.

Scrap Prices Near Peak

STUDY of the price structure indicates the following conclusions to be justified by the statistical position, although of course no allowance can be made for business sentiment. Steel scrap prices are near a peak, and it still seems likely that they will decline before the end of the year, even though some recovery from the recent setback may occur. Pig iron prices are pointed upward and are likely to run higher during the next two or three months before reacting. The price of billets is now about right and is not likely to change in the near future. Steel bars are a little low in price and seem likely to advance. Nails, too, are low in price, but their

market is held down by poor demand and it is a question whether an advance can occur. The spread between sheet prices and the prices of raw and semi-finished materials is low. Here again, however, the demand appears

to be rounding off somewhat, and the future of the sheet market appears uncertain. Perhaps the statistical indications are that sheets are likely to advance a little further and then react.

Steel Construction Making Marked Gains

W.M.Wood, President Mississippi Valley Structural Steel Co., Predicts Greater Building Volume Next Year

WHILE 1928 has been profitable to the steel fabricators of the United States and Canada, the coming year promises to be still more so, according to W. M. Wood, president Mississippi Valley Structural Steel Co., Decatur, Ill., in a statement issued at Biloxi, Miss., prior to the opening of the sixth annual convention of the American Institute of Steel Construction, of which he is president.

"Construction work," said Mr. Wood, "is the one sure measure of prosperity in the United States. It is this measure which has afforded the truest appraisal of the condition of employment and of industrial activity. So far this year, new building contracts have been running at a consistently higher level than in 1927 and will apparently be about 7 per cent in excess of last year. Orders for structural steel during the first few months of 1928 were sufficient to keep fabricating plants operating at about 85 per cent of capacity. The increase in orders brought the plants up to about 95 per cent of capacity before the autumn. The Department of Commerce in Washington estimates that the bookings of fabricated structural steel increased about 25 per cent during the first eight months of 1928 over 1927, whereas shipments of the same material increased about 18 per cent.

"It is obvious to anyone who has studied the situation that, as we approach the time when the housing shortage is overcome and new buildings reach a point where only replacements and normal growth is essential, the proportion of structural steel used to the total building program should further increase. This results from the fact that steel-frame construction is the more economical in first cost, is less subject to obsolescence, is more enduring, and has a higher salvage value than any other type. From this time on, therefore, we confidently expect to see steel construction forge rapidly ahead.

"The total mileage of bridges of all types built in 1928 represented an increase of at least 25 per cent over the year previous, and the mileage of bridges under contract to be built

during the next year will be 50 per cent greater than during 1927. Records of the Bureau of Public Roads will show this. The tremendous increase has resulted primarily from the spread of motor traffic and the insistence of the public demand for better highways. Today we are building longer, wider and more substantial bridges. Engineering experience is demanding that these, to an increasing extent, be built of steel, as that is the only material known which will give the results essential to such structures.

"In the bridge and the skyscraper, steel construction has found a productive field, yet during the past year just closing we fabricators have found new opportunities opening to us. Housing at the thousand airports now building in the United States offers a new and engrossing field for our activities. It is probable that a thousand additional airports will be opened in 1929. The building of hangars is a developing art which the steel fabricator can successfully solve."

Smith Corporation Books 40,000-Ton Pipe Order

A. O. Smith Corporation, Milwaukee, which is executing large orders for electrically welded steel pipe for the Southwestern gas and oil regions, has booked a new order calling for 40,000 tons of 10-in. pipe for the Shell Pipe Line Co., a subsidiary of the Royal Dutch Shell Oil Co. The Smith works is operating at peak production, employing three 8-hr. shifts in its three main departments, namely, automobile frames, welded pipe and gasoline cracking stills.

Officials of International Nickel Co., 67 Wall Street, New York, with main plant at Huntington, W. Va., have organized International Nickel Co. of Delaware, Inc., with capital of \$5,000,000, to take over and operate different properties in United States. Plans are said to be maturing for merger of parent company with Mond Nickel Co. of Canada.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Nov. 29—Activity in Steel Consuming Industries; Dec. 20—Position of Iron and Steel Producers.

Drill Case for Tool Room and Shop Use

A COMPACT sheet steel drill case that rotates on a substantial base and has swinging drawers that cannot spill has been placed on the market by the Union Twist Drill Co., Athol, Mass.

In the tool room the case serves to keep the drills in order and in good condition. Every drawer is plainly numbered, which minimizes delay and error in giving out drills. In the shop, the case may be kept convenient to the drilling job, which saves time, and with the drawers marked, the chance of using the wrong size drill is reduced. The case is less than 14 in. high and the sides are 12 in. wide. All surfaces, inside and out, are finished in durable olive green lacquer.

With the drawers arranged to swing on one corner they can be pulled out so that the contents can be seen, but the drawers cannot be dropped nor put back in the wrong place. The corners of the drawers are slightly rounded to prevent small drills from being caught in the corners. Two sides of the case have drawers for wire size drills from Nos. 1 to 80, inclusive, jobbers' drills from 1/32 to 1/2 in., by sixty-fourths, being kept on the other two sides. Bit stock drills may be kept in the top of the case. A non-corroding two-color metal plate design-

ates the contents of each drawer. The drawers holding the wire size drills are arranged so that odd-numbered drills are in one vertical column and

Two Sides of the Case Are for Wire Size Drills and the Other Two Sides for Jobbers' Drills. Bit stock drills are kept in the top

even-numbered drills in the other, which facilitates putting the drills in the drawers. The bit stock drills are kept in the top of the case and covered with a lid, the various sizes being designated by large tags.

Auxiliary Rack for Use with Hand Trucks

A TRUCK, provided with wheels, is functioning when it is on the move; time lost in loading and unloading is unproductive. The American Pulley Co., Philadelphia, is building a rack or carrier which gives to ordinary hand truck equipment a flexi-

delay at either end of the journey. Temporary storage in warehouse or on freight platform can be arranged in orderly rows without confusion and with a minimum of loss or congestion. This not alone saves time and extra handling, but is a means of improving or installing checking systems.

Truk-Paks permit loading to capacity of miscellaneous parcels that do not lend themselves to stacking on conventional trucks. Bags, cartons and other light packages have a smooth, flat surface to rest upon. As a result, containers are less likely to be broken, ripped, torn or punctured.

The Truk-Pak is built entirely of pressed steel. The deck is a steel plate welded to two steel forgings. These are bent upward and are welded to the inside of channels which form the back or upright. A structure of unusual rigidity is assured by the individual design of the members and by the fact that electric welding at each joint and intersection makes possible a boltless, rivetless unit. Cross bars are of channel section and the longitudinal straps are flanged to impart greater stiffness. The deck is raised far enough above the floor to make room for the truck nose to enter without lifting or disturbing the load.

Dimensions are 28 in. wide by 48 in. high. The Truk-Paks are proportioned so as to stand upright, either loaded or empty, and to be nested in stacks when not in use.

The Rack Increases the Flexibility of Ordinary Hand Truck Equipment

bility comparable with that supplied by trailers, lift trucks and skids.

With the aid of Truk-Paks, as the racks are called, the load is ready to be transported and deposited, without

Vertical-Type Worm Gear Speed Reducer

HEAVY-DUTY worm gear speed reducers arranged to permit vertical driving, with the drive shaft projecting either from the top or bottom, have been placed on the market by the D. O. James Mfg. Co., 1120 West Monroe Street, Chicago.

The housing, of gray iron, is of ample size and has a large oil cooling and heat radiating chamber. The gear shaft is carried in Timken bearings and the worm shaft is mounted in double Timken bearings on one side and Norman-Hoffmann roller bearings on the other side. This bearing arrangement is emphasized as assuring absorption of radial and thrust loads, eliminating excessive heating and reducing wear of both the worm and the gear. Gear shafts are of carbon steel, oversize and are ground to size. Worms are integral with the worm shafts; they are of chrome-nickel steel, heat-treated and ground and fully relieved. Worm gears are of

The Drive Shaft May Be Arranged to Project from Top or Bottom

phosphor-bronze and in the larger sizes are made up of a bronze ring, shrunk and keyed to a cast-iron spider. All gears are of ample face width and the pressure angle of the teeth is 20 to 30 deg., depending upon the number of teeth in the worm and gear.

Pneumatic Tool for Cutting Rivet Heads

A NEW rivet buster, designated as size No. 999, for cutting or busting off rivet heads up to 3/4 in., and for knocking the rivets out, has been

The Capacity Is for Cutting Rivet Heads Up to 3/4 In.

added to the line of the Ingersoll-Rand Co., 11 Broadway, New York. The machine, which can be handled by one man, employs light weight cut-

ting tools that are securely held in the hammer.

The nozzle end is finished with a heavy square-section thread for the retainer nut. This nut takes the hammer blow through a rubber buffer when the hammer is operated with the cutting tool held away from the work. Effectiveness of the retainer device is said to be due to a heavy knob on the upper end of the taper shank tools employed. It is stated that this knob permits the use of light weight tools and, in eliminating notches or grooves, the shank is not

weakened. It provides a shoulder for transmitting the blow through a split nozzle to the rubber buffer and on to the retainer nut, when the hammer is operated without the chisel held against the work, and it is stated that the chisel cannot be shot out of the tool.

Three different tools are available for use with the hammer, a cutting chisel, a shearing chisel and a knock-out punch. The cutting chisel is recommended for general rivet busting, especially for loose rivets, and shearing chisel is for use on tight rivets.

as high as 60 hp., in practically any reduction from unity to 7 to 1, for immediate delivery by distributors in the principal cities of the United States.

The "drives from stock" plan does not affect the range of horsepower available in the silent chain engineering drives, which the company furnishes to industry in general, in drives up to 1000 hp. and over. The company's production of silent chain drives is entirely concentrated in one plant—the Dodge Works, Indianapolis.

New Water Sand Blast Room

A NEW sand blast method using water instead of air is the latest addition to the foundry equipment developed by the Whiting Corporation, Harvey, Ill. The water sand blast, which is now operating in the Whiting Corporation's own foundry, is the culmination of a four-year search for equipment that would do a better job, in shorter time, at lower cost. A stream of sand and water, under pressure, is directed on to the castings to be cleaned. This system has proved particularly effective in removing cores.

In introducing water in place of air, the Whiting engineers, early in the investigation, discovered two prerequisites of successful operation. First, continuous operation must be assured; second, to operate economically, the water must be used over and over.

Continuous and uniform operation is assured by two pressure feed tanks, which are filled and discharged alternately. Automatic valves cut off the empty tank, allowing it to fill up with sand while the other is being used. When the water is drained from the casting it enters a series of settling tanks, which removes all sand and other solids. The water is then used again in the blast. The effectiveness of this system, it is said, is shown by the fact that the pump shows no sign of wear after three or four months—which would not be the case if any sand remained in the water. The sand is removed from the settling tanks, and nails, chips, etc., are removed by magnets. In this way the sand may be saved for core making and other foundry purposes.

The castings are supported on a turntable in the center of the room, which is provided with a removable top to allow the use of cranes in handling. The operator stands outside of the room, controlling the position of the casting and direction of the stream by mechanical means, and watching its operation through a window.

The Whiting Corporation invites foundrymen to inspect the installation, which has been in operation in its own plant for some time, showing a material saving in cleaning time, it is said, and reduction of machine shop costs.

Machine Separates Screw Products from Chips

LOWER construction, to facilitate loading, and automatic feeding of material into the vibrator are improved features of a new model screw machine production and chip separation

are discharged from a chute at the side to a receptacle provided.

Both the vibrator and self feeder are hung on swing brackets and are mounted on heavier shafts than be-

Finished Screw Machine Products Are Separated From Long or Short Chips After the Oil Has Been Extracted. Wood screws, nuts, bolts and other pieces can also be handled. Feeding of the material into the vibrator is automatic

rator, which is being marketed by the McKenzie Engineering Co., New Rochelle, N. Y.

The machine separates the finished parts from long or short chips after the oil has been extracted. The capacity is for parts ranging from $\frac{1}{8}$ to $2\frac{1}{2}$ in. in diameter, up to $4\frac{1}{4}$ in. long, and it is claimed that it takes less than a minute to separate a bushel of the usual run of screw machine products. The machine is adapted also for separating wood screws, nuts, bolts and cartridges.

In operating the machine the operator takes the pan from the oil extractor, empties it into the receiving box, and regulates the air blast by means of a handwheel. The machine feeds the material into the vibrator, spreads it, shakes the parts loose, and blows the chips into a box or other container at the rear. The finished screw machine parts fall directly into a box in the base of the machine, or

fore. The vibrator is of $\frac{1}{8}$ -in. material and the self feeder is of 3/16-in. sheet steel. The blast gate is combined with the blower, and the hood of the machine is now integral with the frame, to minimize vibration.

Link-Belt Silent Chain Drives from Stock

SILENT chain drives from stock, up to 60 hp., are offered by Link-Belt Co., 910 South Michigan Avenue, Chicago. Four years ago the company inaugurated the plan of furnishing silent chain drives from stock, of $\frac{1}{2}$ to 10 hp., as a joint result of standardization and quantity production. In 1926 the range of horsepower was increased to 15.

According to the latest Link-Belt silent chain publication, Book No. 725, it will be possible to obtain drives

National Publicity for Steel Urged

Better Marketing Calls for Group Action—Development of New Uses and New Markets Advocated as a Primary Object

BY CHARLES H. MACDONALD*

IN a book I recently read the author refers to the cow as an excellent example of placidity. He further states that sometimes great success in business unconsciously develops in an individual or an industry a feeling of assurance and satisfaction which almost approaches bovine placidity.

Recalling many comments and articles from within and without the industry, I wondered if the great vision and spirit which has made steel a world synonym for foresight, progress and leadership has been lagging.

Some comments have intimated that our pastures have been broad, the grass has been plentiful; we have for years browsed contentedly on the food under our nose, and lain down in the shade until our capacity indicated room for more. Meanwhile, the more active and energetic sheep and goats of other industries entered the field of steel. They long ago ceased to be content with our leavings. They are now very frequently first in the new pastures, while steel has been placidly taking whatever comes to it without too much effort.

Marketing Problems Not Solved

That is not a flattering picture; but whether it is true or merely an exaggeration, we as manufacturers, users and distributors of steel have some facts to face, and, until we are prepared to recognize them as such, all the brains of our development and production engineers and all the hundreds of millions of dollars poured into plant equipment will continue to be ineffective toward solving our real problem.

There is something larger and perhaps more important than the active competition of one steel manufacturer or fabricator with another to secure orders for the established products of his plant.

I am thinking of the character of this competition and its effect on steel; of the possibilities for turning some of the ability which has made steel great from a manufacturing standpoint toward engineering and sales effort that will strengthen its position with relation to outside competition and broaden its uses in fields not yet developed.

Contrary to the good book which

says all men are liars, it is admitted that most business men are moderately truthful, and yet we rarely like the truth as applied to our own affairs. On the third day out the mate of a sailing ship observed an entry in the log which read: "The mate was drunk yesterday." He went to the skipper and said, "Captain, you can't leave that entry in the log." "Well," said the captain, "It's true, isn't it?" "Yes,

but I've never been drunk on duty before, and never will be again. That record will cause me to lose my berth, and I'll have a hard job to get another." "Well, the entry is true and it stays," said the captain. The following week the mate kept the log and one morning the skipper was horrified to read, "The captain was sober yesterday." Both entries were correct, but neither man liked the truth.

Says Mr. Schwab Points the Way

MR. SCHWAB has been saying a lot of things about the steel industry in the past year or so. He has frequently called attention to our production accomplishments and the rust on our selling machinery. Because it is generally conceded that Mr. Schwab ought to know something about steel and particularly about the selling and distribution of steel, his published remarks have greatly interested the business world generally, and bankers and competitive industries specifically. He has sometimes been referred to as "a cheerful optimist," but I have never heard him called a "Pollyana," probably because his brand of optimism has always represented the difference between meeting problems with a backbone instead of a wishbone.

After his address before the National Distribution Conference in New York last June, someone said: "Mr. Schwab, if you mean 50 per cent of what you have just said and we can put 25 per cent of it into effect, it will mean a rebirth of the steel industry." He replied, "I am thoroughly sincere in my remarks. Ministers of the Gospel are not always holy men, neither do their families or congregations always follow their preachments, yet if they ceased to continually expound the truth interest in spiritual matters would soon wane."

Meaning that it's up to us all as individuals to pick up the ball and carry it forward.

Men in the Ranks Should Help

Some big executive of some great corporation here or there is mysteriously supposed to take the lead or set the pace in all these matters. There is too often, however, a very apparent reluctance on the part of subordinate officers, sales managers or field men to state the truth frankly

and argue the facts with their top executives. We are inclined to forget that we all look pretty much alike in pajamas or just after we've dubbed a golf shot, and with all due respect for titles they do not alter the outlook or attitude of real men. It behooves us all, as organizations, firms, and particularly as individuals, to determine what we stand for and then to do our utmost to put the policy into effect. The power of this massed opinion and action will soon become so great that no one responsible for operation or management can deny its force or will care to ignore it.

I am not inferring that the higher executives in this industry are either blind, incompetent, or drunk with the desire for conquest. It would seem, however, that too many of them are handicapped because they do not get close enough to the fundamental conditions affecting our industry. The men in the field talk with dealers, fabricators, consumers and competitive salesmen. They discuss their various problems freely, such as lack of organized steel publicity and propaganda by the industry, advertising, distribution generally, price cutting, the effect resulting from the pernicious habit of the mills competing directly, and often upon a most unfair and unbusinesslike basis, with the trades to which they look for a bulk of their business. No president of any corporation likes to be called a horse trader. It hurts his pride. Neither does the sales manager nor the salesman. He has some pride, too; but he also has a quota to make, and if in effect he is told to get business no matter how, but *get* it, that's what he does. This is all destructive competition within the industry.

An employer talking seriously to one of his colored workers said, "Sam, I suppose you save at least half of

*Manager of Market Research Department, Colorado Fuel & Iron Co., Denver, who addressed the convention of American Institute of Steel Construction at Biloxi, Miss.

all you earn?" Sam replied, "Naw sah, boss, Ah don't get it."

We earn it in the steel industry; that is, part of the industry at least earns it, but we don't get it. Quoting a prominent steel executive in a recent address:

"It's a sad commentary on the world's greatest and most important industry that it does not earn 5 per cent upon its invested capital. The forty-four million tons of steel produced in the United States represents 45 per cent of the total world production."

Steel Distribution Problems Unsolved

We admit that we have the world beaten on quantity, cost and production methods. When it comes to the even more important factor of distribution, however, the milkman, the florist, the baker and the laundryman is daily demonstrating to the steel industry the value of group industrial organization, and the how and why of producing something vital it has long since failed to show—a satisfactory statement of earnings.

I will not dwell upon what the cement, lumber, brick and some of the other large industries are doing along this line of group effort, in the way of publicity, distributor support, consumer education and good will, nor upon the results accruing to them from such practical organization methods. The interesting and important feature of this situation is that the millions of dollars spent by these organized industries do not represent an added expense upon the industry, but have in every instance increased both volume and profit for the individual concern and the industry as a whole. The steel industry, however, placidly continues to blink the fact that this is the road toward more successful distribution and increased profits in big business.

This group industrial work has, as a matter of course, also created a better feeling between competitors in each industry, just as the work of the

American Institute of Steel Construction has succeeded in bringing about better business relations between firms and individuals who once regarded each other with antagonism. I believe that the American Institute of Steel Construction has accomplished more for the fabricators of structural steel and for the steel industry during the past few years than any individual or organized effort in existence. I have heard this opinion expressed by more than one prominent man in the steel industry and outside of it.

The steel industry has in the American Iron and Steel Institute the vehicle or framework for a structure which can quickly be made effective

along some such lines. Indications seem to warrant the hope that this organization will become more active in matters of policy which so vitally affect the steel industry. The institute cannot do these things alone, but if the executives of the various steel companies believe, as many of them have indicated, the precepts so generally expressed are right and sound, it requires only the adoption and organized support of these principles to place the steel industry on a basis, where like several others, it will realize more of the returns to which it is entitled. [Mr. Macdonald made a number of definite suggestions to the steel industry, which appear in a box.]

Should Seek and Foster New Markets

IT is said that the development of steel ships and railroad coaches and the material requirements of the automobile received very little attention from the steel industry in the early stages of their development. Should a few bold visionaries be obliged to work for years unaided to create the demand for a million or more additional tons of steel to be used in steel frame dwellings, more artistic steel highway bridges, steel roadbase for the highways and railroad beds of the future, and for many other projects considered practical by competent authority, but as yet unproven commercially?

Who shall say with finality that these things are more visionary than steel ships, steel railroad coaches and all-steel airplanes were thought to be within the memory of us all?

In THE IRON AGE of Sept. 1 and Dec. 22, 1927, two articles were published on the subject of steel railroad ties. It was shown that 50 per cent of the annual tie replacement business of the railroads in the United States would represent an approximate increase of 2,500,000 tons of steel a year. It was suggested that research and study by the steel indus-

try along this line might reasonably develop radical and advantageous changes in railroad construction. A hornet's nest was immediately stirred up by these articles. Trade papers, magazines, the daily press here and abroad, defended, attacked and commented neutrally. There was no interest exhibited by the steel industry, however, to and for which the articles were written.

Meanwhile, the *Railway Age* printed an article on Jan. 14, 1928, describing an experimental roadbed job which the Pere Marquette Railroad had quietly done at its own expense, and which may disprove most of the theories assuming wood ties to be necessary or more desirable. A very large proportion of steel is used in conjunction with concrete in this experiment, but the title of the article published again in the July *Scientific American* reads: "Is concrete better than cross ties?" The Concrete Association was on the job all the time, working closely with the Pere Marquette, supplying data, taking progress photographs and otherwise assisting in this practical development work.

Naturally, they are not advertising steel; but if you will read the article

Mr. Macdonald's Suggestions to the Steel Industry for Better Marketing

THE public should be educated, through a well planned national campaign of publicity, to the value of steel and its greater use in all requirements large and small.

For example: A tax of only one cent per ton on American steel production would represent a fund of more than \$400,000 a year for publicity, sales promotion and development work.

A marketing policy should be established and clearly defined to the trade.

There should be developed in every manufacturer, distributor and user of steel a realization of his opportunities and responsibilities in and to the steel industry.

More effort and money should be devoted

to neglected markets for the established and logical use of steel.

A fund should be created for the development of new uses for steel.

We should be in position to offer through an organized bureau, to any industry using or contemplating the use of steel, all the facilities of the entire steel industry to more rapid and satisfactory development of any practical new product, instead of leaving the customer or some individual steel manufacturer to work out at an undue expenditure of time and money, products which ultimately bring business to the entire industry.

More attention and study should be

given to the problems of individual fabricators and users of structural steel and steel products of every kind, for the purpose of helping them to increase profits by diversification, reduction of shop overhead and selling expense, and by enabling them to operate, uniformly more hours per year.

Concerted action should be taken, following the lead of other organized industries in protecting themselves against proposed unfavorable legislation and unitedly working for the revision or revocation of existing laws or statutes that may be obsolete or out of line with changed conditions, but that are causing unreasonable and unintended difficulties for the manufacturers and users of steel.

last mentioned you will conclude that steel is an important factor in this construction, and you will probably wonder just how much concrete may be ultimately required with the steel to get the best result.

Group Action and Its Results

This is a fair example of thousands of similar happenings which prove the value of the Concrete Association's work in sales research, sales promotion, material and mechanical research, etc., to the benefit of the entire cement industry.

I can step off the train at a water station in Maine, or New Mexico and tell the clerk in any little flower shop that I want a dozen yellow rosebuds delivered at any given address in Paris at 2 o'clock tomorrow afternoon. He consults a little book and says "All right, seven dollars, please," and I know the flowers will be there. That's organized industry. They make you send flowers to mother on Mother's Day which they created, and you wear flowers on Father's Day if you're a dutiful father whether you like to wear flowers or not. Flowers and steel are a long way apart, but the same fundamental principles of marketing apply.

New mergers and consolidations are being continually effected. These may only proceed to a certain point before running counter to the law. No court in the world, however, can or will try to interfere with the legitimate grouping or massed effort of any industry to the purpose of more successfully promoting the use and sale of its products. As a matter of fact, the efforts of the United States Department of Commerce are directed along this very line, recognizing it as a movement of national economic importance.

We have heard several remarks to the effect that the steel industry cannot be organized. Competition is too keen; too much feeling over imagined or real territorial encroachments; too much ambition on the part of one company to gain ascendancy over another; too much capacity, and not enough business. In other words, we are expected to believe that in the industry where the greatest opportunities lie there is no possibility of harmony.

Very likely there were some bad actors in the lumber, cement, brick and all the other industries now enjoying the benefits of organized action. The idea was probably not adopted unanimously in any industry until the results became apparent.

In the interest of self preservation several industries, some of them representing a large percentage of steel consumption, have adopted the principle of united action and organized effort, and they have proved its value beyond question. I refer particularly to the bolt, nut and rivet industry, the fabricators of structural steel and the sheet steel industry.

If organized industrial operation is good for large units of the steel in-

dustry, why should it not be good for the industry as a whole?

Present Policy Benefiting No One

We spend a million or a hundred million dollars to reduce the cost of steel, and then we reduce the selling price still further, consequently forcing down competitors who can even less afford to take the greater loss. As a result, we are wasting money, benefiting no one, not even the consumer. We are intensifying the battle between fabricators of all our products and minimizing their profits; we are developing a situation which will inevitably result in a lowered wage scale, and in following this general procedure, we are running counter to every law of business economics.

Research Offers Greatest Hope to Industry

The importance of scientific research was emphasized by Charles M. Schwab in an address at a dinner tendered the "Pioneers of American Industry" at Hotel Astor, New York, Oct. 24. He said, in part:

"The pioneering work of the future is to be done very differently from that of the past. We saw in the Great War that the era of individual heroes, and even of individual generals capable of daring deeds in battle, was replaced by vast organizations moving over wide fronts. Will it not be so in the future development of industry and material progress?"

"Society is today improving by organization and cooperation among its members. The greatest work that is being done for the improvement of industry is in the laboratory of the research worker. The most active of our modern industries are those which are founded on recent scientific research. Industries themselves organize research on a large scale.

"Consider the case of shipbuilding, for instance. The hull of a ship reminds us of the wealth of research that has been expended in metallurgical laboratories on the qualities of steel. Inside the hull the engines, whether they be turbines, reciprocating or internal combustion, Diesel, or otherwise, exemplify a range of study into almost every phase of physical and chemical science, requiring the use of every stage of instruments, the development of which is a craft by itself.

"And then the screw of the ship, with its unique design, causes us to think of the curious and efficient thrust block by which the force of the screw exerts its influence upon the ship, a plan based on Michell's study into the physical properties of liquids.

"We look up and see the wireless device, also an offspring of the physical laboratory. The sounding apparatus is based on the designs of Lord Kelvin. A study of the laws of acoustics have enabled ships to utilize apparatus for establishing the depth of

This subject has been and is being much discussed and written about. It has reached a point where it becomes of vital interest to every man directly or indirectly connected with the industry.

The answer lies not in better mill practice or production methods; not alone in better sales management; but in a combination of forces for better and more modern distribution methods. This must be reflected all the way from the executives of individual steel companies down to the salesmen in the field, and from the industry as a whole down through its fabricators and dealers, to the consuming public.

A legitimate association or alliance for better business to the benefit of an industry and every customer it serves!

water by echo. The ships carry refrigerating apparatus, recalling the investigations into the production of cold, again by students of science. You might go through the whole ship and you will find that it is linked by innumerable ties to research in the laboratories.

"The same is to be said for the motor industry. The problems of the internal combustion engine and the various metallurgical difficulties have been, and are still being, solved by the patient study of innumerable scientists.

"The same is to be said of the aeroplane, the chemical industry, the electrical industry. New applications of scientific knowledge, new ideas, new process, new machines, must always be in preparation. Off with the old, on with the new, is the battle cry of industry!

"The essential point is that in the future pioneering will be done by great groups of trained men utilizing each other's scientific knowledge, rather than so much by the individual, as has been the case in the past, when so often an invention was the result of a lucky chance or a happy idea."

Committee on Heavy-Duty Anti-Friction Bearings

George T. Snyder, chairman of the iron and steel division of the American Society of Mechanical Engineers, New York, has announced the appointment of a division subcommittee on heavy-duty anti-friction bearings. The personnel of this committee is as follows: Lane Johnson, chief engineer United Engineering & Foundry Co., Pittsburgh; Charles H. Hunt, chief engineer Weirton Steel Co., Weirton, W. Va.; R. C. Stiefel, engineer, Ellwood City, Pa.; H. E. Brunner, chief engineer SKF Industries, New York; G. C. Farkell, superintendent rolling mills, National Tube Co., Lorain, Ohio; William Messinger, Hydraulic Tool Works, D Street, Philadelphia; Sidney G. Koon, secretary, associate editor THE IRON AGE, New York.

Steel Fabricators Meet at Biloxi

Business and Technical Problems Relating to Structural Work Discussed—National Advertising Campaign for Whole Industry Suggested

THE American Institute of Steel Construction is meeting this week at Biloxi, Miss., devoting the first few days of the week to business sessions and the latter part of the week to golf and other entertainment. Charles M. Schwab, chairman Bethlehem Steel Corporation, is to be one of the speakers at the banquet Thursday evening.

One of the outstanding addresses of the convention was that delivered by Charles H. Macdonald, manager market research department Colorado Fuel & Iron Co., Denver, published fully on another page of this issue. Mr. Macdonald made a plea for more complete organization of the steel industry to the end that a comprehensive and coordinated effort may be made in a national advertising campaign selling the value of steel. Cultivation of neglected markets and the development of new uses of steel were other suggested aims of a national publicity campaign.

Adjustment to New Conditions Necessary

W. M. Wood, president Mississippi Valley Structural Steel Co., in his address as president of the institute, argued for more extended industrial cooperation.

"We are in a period calling for adjustment to new conditions," said Mr. Wood, "and he is indeed wise who, realizing that fact, attends to that adjustment promptly. In spite of this, there are those who are unwilling to give up the traditions of the past and who therefore see nothing but evil in the new order of things.

"We live in an age without parallel in the history of the world and in a country the envy of the civilized world. We have greater wealth than has ever fallen to the lot of any nation to hold and this wealth is not in the hands of a few, but distributed among the many. Progress and improvement in art, in industry, in science and in all things for good are evident upon every hand. Whatever our environment is, we want to make it better and, as a nation, we have the means to do so."

Mr. Wood recommended that the work already started to improve the conditions between the industry and the rolling mills, the public and the competitors of structural steel be extended and carried further.

"The steel industry," continued Mr. Wood, "is looked upon as an essential industry and as such its leaders have

for years felt that no action for the development of the industry need be taken; that little, if any, effort need be exerted by them for the development of the industry with the exception of that taken along mechanical lines. In the vital problems of sales and distribution and publicity, the industry as a whole has seemed to be where it was a generation ago, and until recently this fact seems to have been no cause for concern."

Code of Selling Ethics Recommended

Charles F. Abbott, executive director, in his annual report to the convention, stated that the association of steel fabricators had made notable progress during the past year. This was shown in the increase in membership, increase in income for cooperative work, and the widespread use of the standards in specifications and trade practices promulgated under the auspices of the institute. More than 170 cities are now permitting buildings to be constructed in accordance with the standard specification of the institute.

During the past six months the institute has had the service of 10 field engineers whose sales efforts on behalf of steel construction have shown practical results.

Mr. Abbott recommended the re-inauguration of an advertising program on the part of the steel fabricators. He also recommended the preparation of a code of selling ethics for the industry.

He called attention to the Sherman anti-trust law, which, he stated, contains "some obsolete features and many doubtful elements," and this law is probably "responsible for some of the business man's worries. A modification of this law, with intelligent interpretations, would undoubtedly offer relief, but by no means is it alone responsible for the new conditions now confronting our business activities, nor would its appeal remove the principal present day problems."

Public Not Yet "Sold" on Steel

F. H. Frankland, in charge of the technical service of the institute explained the practical results obtained through the services of district engineers. The engineers have been operating only five months, Mr. Frankland pointed out, yet they have proved of definite value in promoting steel construction throughout the country.

"The work of the district engineers," said Mr. Frankland, "is fundamentally promotional, and must eventually be measured in the broad aspects of the education of the public, the engineering and architectural professions and the building industry, to the facts and truths of steel construction."

Experience during this brief time has shown the need of a well-planned advertising program, Mr. Frankland said. All the district engineers have become convinced that their labors are greatly hampered by the fact that the public has not been "sold" on steel, and it is essential that a "steel consciousness" be inculcated in the minds of the architect, the engineer and the builder through a comprehensive national advertising campaign.

Government Has Large Building Program

J. Edward Cassidy, consulting engineer of Washington, D. C., called attention to the increase in building work under the auspices of the Government. Appropriations for \$250,000,000 have been authorized, and new buildings on the Mall in Washington alone will cost in excess of \$200,000,000. An appropriation of \$65,000,000 has been made for Army housing. The Navy and other branches of the Government are also planning extensive structures.

Aside from the direct Government building program, Mr. Cassidy called attention to the great amount of work that will result from the establishment of the new aviation fields. These activities, Mr. Cassidy said, make it necessary that the steel fabricators be represented in Washington for the purpose of acquainting the branches of the Government with the latest and most modern engineering ideas regarding steel construction.

"In the next 10 years," said Mr. Cassidy, "expenditures by the Federal Government on these various construction programs will undoubtedly aggregate a billion dollars, and it is certain that the structural industry has more than a passing interest in such a construction program, and that the effort and money required to promote the use of structural steel, will be time and money well spent."

A Defense of the Purchasing Agent

L. F. Boffey, editor of the *Purchasing Agent*, defended the purchasing agent and declared he is not respon-

sible for the demoralized condition in the marketing of products.

"It is quite true," said Mr. Boffey, "that all purchasing agents characteristically seek to buy at the lowest price at which a producer is willing to furnish the required material. That is an essential aim in purchasing. In typical industries, expenditure for materials represents 60 per cent of the total production cost. An over-liberal or careless purchasing policy, resulting in an increase of 5 per cent in the cost of materials in the course of a year, will reduce by 3 per cent the amount of profit which the company will earn in the same period. Actually, the saving from proficient buying, as compared with haphazard or rule-of-thumb methods, is more likely to approximate 10 per cent according to studies made in Government and industry.

"Every dollar wasted in the purchasing department is the equivalent of the profit on a \$10 sale, based on average profit returns. A wastage of 5 per cent on a purchase budget of a million dollars eats up the profits on half a million dollars of sales. In the face of these statistics, it is futile to argue that the purchasing agent should pay a higher price for any commodity than he is required to pay by economic conditions and the desire of producers for his business. To do so would be to endanger the interests of his own company and to play into the hands of the company's competitors. There is no problem of ethics in this situation; it is purely a question of economics. The fact is that the real profits of industry today are the reward of careful buying, and many concerns which bewail their own profitless condition might find a solution for their ills in wiser purchase and better utilization of materials."

Progress in Steel Welding

Fred T. Llewellyn, president American Welding Society, in discussing welding as a fabricating tool, pointed out that experiments demonstrate conclusively that welding has a place in steel construction work. Wherever it is necessary to eliminate noise as much as possible, as in the case of additions to hospitals and similar structures, welding has been used with success. It remains now to demonstrate the possible economies.

Mr. Llewellyn said that experiments have produced the following conclusions:

Standard grades of structural steel can be satisfactorily welded.

The welding operation does not adversely affect standard structural grades of base metal.

Methods of making welds by different processes have been standardized to a considerable extent.

The unit values for the strength of welded joints can be readily determined.

The practical soundness of a welded joint can be insured without destructive tests.

The economic advantage of welding varies with different classes of work.

Mr. Llewellyn expresses the opinion that whereas welded structures seem

to be feasible the relative costs are not yet on a plane with riveted steel, nor has the skilled workmanship necessary proved available.

Flame Cutting of Structural Steel Declared Economical

Flame cutting of structural steel has been found to be practical and economical, according to J. R. Dawson, metallurgical engineer of the Union Carbide & Carbon Corporation, in a paper read before the convention. The paper was prepared by S. W. Miller and J. R. Dawson, and was illustrated and demonstrated by the use of apparatus set up for this occasion.

"In many instances," said Mr. Dawson, "cutting structural steel with the oxy-acetylene blowpipe saves time and money. The demands of economy have enlarged its use to such an extent that general interest has been aroused among those concerned with steel construction. Numerous theories, both favorable and adverse, about the effect of the flame cutting, have been advanced to support the opinions of those interested in the matter."

Many tests were described and illustrated from which Mr. Dawson concluded:

"All flame cuts should be made as smoothly as possible.

"Structural steel is not injured by smooth flame cuts such as are produced with a shape cutting machine or other apparatus for getting steady travel of the cutting blowpipe and such as can be secured by experienced operators.

"Hand cut structural steel is not damaged in the material itself, but depending on the extent of the irregularity of the cut, the elongation obtained in bending the rough surface is less by a small amount than the elongation with milled or machine cut specimens."

Use of Steel Joists as Floor Fillers

Frank Burton, consulting engineer of Detroit, made a defense of steel joists, and described their application to structural steel buildings. He told how the first joists were made of sheet steel in 1855, to be used in a building in the city of New York. He also narrated the development of steel joists from that date. "The great variation in the capacities of joists manufactured by different companies," said Mr. Burton, "had made it difficult to design with steel joists, and one of the great needs of the industry of today is the standardization of joists."

New data and studies on fire resistive materials, etc., are bringing to light new evidence regarding the work that the steel joist must do.

"While it is natural to expect steel joists to be used in fire resisting structures these joists," said Mr. Burton, "have also been used to a considerable extent where fire resistive construction is not required."

He concluded: "The use of steel joists as floor fillers in steel-frame buildings is a subject that deserves the serious attention of every steel fabricator. The use of structural

steel can be increased, while builders can obtain better and more economical buildings by the intelligent combination of these two building materials."

All-Steel Floors Reduce Dead Load

Lee H. Miller, chief engineer American Institute of Steel Construction, in his annual report recommended a further study of floor design. He advanced the idea that an all-steel floor, according to all present available data, seems to be the best for building construction.

"We have almost innumerable types of floor construction," stated Mr. Miller, "but practically all of them have very definite handicaps. My belief is that it will be possible to develop an all-steel floor construction which can be properly protected from fire on the ceiling side, and reduce the dead load of the floor construction by 20 lb. or more per sq. ft."

Mr. Miller called attention to the conferences during the past year with highway and railway bridge engineers for the purpose of standardizing specifications for those structures. These and other studies are bringing to light points at which the standard specifications adopted by the steel fabricators should be extended. Flame cutting has been definitely established as practical and safe. There is need, however, of further defining the standards in regard to riveting, Mr. Miller said.

"It must be recognized," he said, "that before any uniform practice on the determination and design of multiple story structures to resist wind stresses is established, it will be necessary to fix the working stresses of rivets in tension under certain conditions. The engineering profession is not, in my opinion, ready to accept the unrestricted application of tension stresses to rivets, and the revisions in the institute's specification clearly define the limiting conditions under which rivets may be used to carry tension stresses."

Gray Iron Institute Names Membership Committee

The Gray Iron Institute, Terminal Tower Building, Cleveland, has appointed a membership committee with Fred S. Erb, Erb-Joyce Foundry Co., Detroit, as general chairman and including all the 75 members of the institute. The following nine vice-chairmen will assist Mr. Erb in various foundry centers: W. F. Bornfleth, Cream City Foundry Co., Milwaukee; A. E. Clarke, Des Plaines Foundry Co., Des Plaines, Ill.; Horace R. Culling, Carondelet Foundry Co., St. Louis; Chester A. Peebles, Stedman's Foundry & Machine Works, Aurora, Ind.; H. P. Messlor, John E. Thropp's Sons, Inc., Trenton, N. J.; D. L. Sacks, Louis Sacks Foundry, Inc., Newark, N. J.; R. R. Simonton, Ensign Foundry Co., Toledo, Ohio; H. E. Smith, Woodward Iron Co., Woodward, Ala.; Fred F. Stockwell, Barbour-Stockwell Co., Cambridge, Mass.

Change Is Keynote of New Industries

Success, Says E. W. McCullough, May Depend on Readiness to Scrap Today's Methods and Equipment

PROGRESSIVE obsolescence, the arteriosclerosis of industry, was portrayed as the most formidable threat of broadening competition by E. W. McCullough, manager department of manufacture, Chamber of Commerce of the United States, in an address Tuesday before the Lima Chamber of Commerce, Lima, Ohio.

"Communities," he said, "which are intent upon industrial expansion will, if they are wise, take into consideration the many general factors upon which industrial success depends. The pace of the present day is terrific. Scientific discovery, developments in management, the evolution of new methods and the adaptation of new commodities to old uses are changing our methods of production more rapidly than ever before. The successful industry of today has no assurance that it will be successful, by following the same methods, tomorrow.

"Production in many lines of industry has reached its peak, at least until larger markets and better distributing methods are established. Consequently, to build more plants and to create more capacity for production in those lines is little short of folly. There are exceptions, of course. One of them is where a market is found for the commodity and the factory is so located as to be able to take advantage of it, provided other manufacturing requirements are also fulfilled. Another exception is found in the new factory built to utilize the latest processes and equipment and therefore able to compete more than successfully with older units of the industry that are retarded by an obsolescence problem.

Progressive Obsolescence Guiding Principle in Newer Industries

"What is progressive obsolescence? The best answer consists in simply pointing to two outstanding examples, the automobile industry and the radio industry. It has been the guiding principle in these two industries since shortly after their inception, and we are so used to it there that we scarcely think of it in other fields except possibly in connection with style commodities, such as clothing. Nine or ten years ago crystal radio sets were the rule. These were scrapped for one-tube sets, and these in turn for two-, three-, four-, five-, up to nine-tube sets as fast as science made them available. The modernistic trend in furniture is also attracting the attention of the furniture industry. This will prove to be an interesting experiment to watch. Many of us are educated to standard types of furniture and frequently use what we have purchased for some time after the period of greatest usefulness has passed.

"The parallel holds true as well in the production of goods. The indus-

trial world supremacy of America is based on the application of the principle of progressive obsolescence in both factory and office. Andrew Carnegie secured for this country supremacy in steel by building and tearing down one steel mill after another as metallurgical science indicated the way. His scrapping policy revolutionized the industrial world and marked the beginning of that period in which we now are—a period marked by intense competition and a rapidity of change unparalleled in the history of the world.

"In developing any program of industrial expansion we are then confronted by the operation of the principle of progressive obsolescence in two different directions, either one or both of which can become the source of much industrial grief if not carefully evaluated before definite commitments are made. If a community is about to obtain a new industry, it is well first to ascertain the degree to which its principal product is either coming into use, or going out of use, together with all important modifications that will eventually have to be faced. We are often prone to think of competition only in terms of that which we encounter from other manufacturers in the same line of industry. Instead, whole industries today

are competing with each other for the supplying of the same demand through different media. And the newest one in the field can never be certain very long that something still newer will not soon be forthcoming.

Obsolescence a Legitimate Production Cost

"Again, if a community is about to obtain a new industry, it must in addition assure itself that the proposed process and equipment are sufficiently modern in type to permit the new plant to compete successfully with the latest developments in its particular field. On every side we hear much today of the excess manufacturing capacity that exists in many lines. Not so frequently, however, do we hear the corollary to that old story, namely, that anywhere from 25 per cent to 75 per cent of that excess capacity in any one particular line might be in such a stage of obsolescence as to make its early extinction an act of economic justice. But in these days of microscopic or invisible margins of profit manufacturers are prone to ask how they can afford to carry out extensive scrapping policies. The answer is found in subscription to the newer idea that obsolescence of plant is a legitimate element in the cost of production—a sort of advance charge that must be deducted from profits in order to insure the creation of a fund sufficiently soon to buy new equipment when it has been demonstrated that existing equipment is no longer in position to compete."

Machinery Industries Consider Problems

Second of Series of Conferences Focuses on Measures to Curb Unfair Trade Practices

WASHINGTON, Nov. 13.—Plans for solution of common problems in the machinery and equipment industries were discussed at a meeting at the Chamber of Commerce of the United States here on Thursday of last week, with an attendance of 36, made up of representatives of trade associations, the Government and the chamber. It was determined to attempt to work out the problems through a series of conferences, the next to be held early in February at the United States Chamber of Commerce Building. The first conference was held at Montauk Point, N. Y., Sept. 29.

Under a motion adopted at the Washington meeting, the interested trade associations will submit individual suggestions to Philip P. Gott of the Chamber of Commerce's Trade Association Department, which, acting as a clearing house, will send them to the other associations. It will be determined which of these suggestions are the most important for discussion at the next conference, to be followed by others until the industry finds the best means of solving its problems. Unfair trade practices, cost accounting, credit terms, obsolescence and other subjects will be dealt with in

the hope that greater uniformity of practices can be adopted by the industry as a whole.

Suggestion has been made of the possibility of organizing a body similar in many respects to the German Machinery Manufacturers' Association, which, with 103 subsidiary organizations, represents 93 per cent of the entire machinery and equipment industry of Germany. But these and other ideas so far have not gone beyond the stage of informal discussion. There was a consensus of opinion at the meeting, however, that the industry should take some concerted action looking toward closer contact, unified effort and establishment of confidence.

In opening the meeting, Chairman E. F. DuBrul, general manager National Machine Tool Builders' Association, pointed out that it had been called to see if the industry could continue cooperation along the lines discussed at the Montauk Point conference. Reference was made to the contact that the German industry had built up through the German Machinery Manufacturers' Association with its splendid influence in unifying the industry of that country.

The first effort of any unit of the

industry to eliminate unfair trade practices was disclosed through the announcement of Fred A. Collinge, manager Association of Manufacturers of Woodworking Machinery, that the association has proposed a tentative list of rules which will be discussed with T. M. Flannery of the Federal Trade Commission trade practice submittal division at a meeting in Chicago about the middle of December. This program, it was intimated, might develop general action among the other units of the industry in taking similar action so that uniformity of trade practices would be set up in the industry.

Dr. Hugh P. Baker, manager of the Trade Association Department, United States Chamber of Commerce, said that there is an interesting trend toward the federation of trade associations representing entire industries, but warned against dangers in organizing too effectively along vertical lines, from the raw material to the finished product, and the elimination of independent action by individual groups. He also said that the matter of expense is important and that consideration should be given to better organized effort at lower cost.

Speaking of the machinery and equipment industry as a super-key industry, Walter H. Rastall, chief Industrial Machinery Division, Department of Commerce, declared that it requires better organization. While the American industry produces 57 per cent of the world output of machinery and equipment, Mr. Rastall said, it has only about 35 per cent of the world's market. He held that this was disproportionate to its capacity and should be raised to its deserved level. He urged representatives of the industry to organize with this end in view. He also discussed obsolescence of machinery and pointed to this as a field which should be cultivated for the purpose of building up increased domestic markets.

Methods of operation of the trade practice submittals of the Federal Trade Commission were explained by Henry P. Fowler, Research Department United States Chamber of Commerce. He pointed out that the initiative for holding conferences on the subject with the commission was always taken by the interested industries.

Those present at the conference included the following:

- R. J. Walker, Lieutenant Commander, United States Navy.
- S. M. Williams, manager Engineering Construction Division, Associated General Contractors.
- Gorton James, chief Domestic Commerce Division, Bureau of Foreign and Domestic Commerce.
- A. P. Robinson, chairman Mixer Manufacturers Bureau, Associated General Contractors of America, Washington.
- C. S. Embrev, secretary Mixer Manufacturers Bureau, Associated General Contractors of America, Washington.
- Ray M. Hudson, assistant director Bureau of Standards.
- Malcolm Baird, secretary Screw Machine Products Association, field secretary-treasurer Pressed Metal Institute, Buffalo.
- C. H. Rohrbach, Compressed Air Society, New York.
- C. B. Andrews, Manufacturers Division, National Crushed Stone Association.

- J. R. Boyd, manager National Crushed Stone Association, Washington.
- Verne E. Minich, representative Foundry Equipment Manufacturers Association, president American Foundry Equipment Co.
- H. Cole Estep, secretary-treasurer Foundry Equipment Manufacturers Association, Cleveland.
- Fred A. Collinge, manager Association of Manufacturers of Woodworking Machinery.
- Henry Buker, president National Machine Tool Builders' Association, Providence, R. I.
- John W. Ogren, commissioner Elevator Manufacturers' Association of the United States.
- E. W. McCullough, manager department of manufactures United States Chamber of Commerce.
- E. P. Essley, secretary Associated Machine Tool Dealers, Chicago.
- C. E. Breece, Dairy and Ice Cream Machinery and Supplies Association.
- D. N. Benedict, delegate from Refrigerating Machinery Association, treasurer Frick Co., Waynesboro, Pa.
- Richard M. McClure, secretary National Laundry Allied Trades Association; Flour Mill Machinery Manufacturers Association.

- W. H. Rastall, chief Industrial Machinery Division, Bureau of Foreign and Domestic Commerce.
- A. R. Taylor, American Tar Products Co., Pittsburgh.
- P. L. Griffiths, Manufacturers' Division American Road Builders' Association, American Tar Products Co., Pittsburgh.
- Charles M. Upham, American Road Builders' Association.
- F. B. Curran, Automotive Division (Highways), Bureau of Foreign and Domestic Commerce.
- C. W. Conner, American Road Builders' Association.
- E. F. DuBrul, general manager National Machine Tool Builders' Association.
- H. C. Dunn, Domestic Commerce Division Department of Commerce.
- Henry P. Fowler, Research Department United States Chamber of Commerce.
- Philip P. Gott, Trade Association Department United States Chamber of Commerce.
- Hugh P. Baker, manager Trade Association Department United States Chamber of Commerce.
- Harry Botsford, secretary Society for the Development of Internal Combustion Power.
- D. A. Skinner, secretary Chamber of Commerce of the United States.

Simplified Schedules Affirmed for Several Items

WASHINGTON, Nov. 9.—Announcement has been made by the Division of Simplified Practice that a simplification program for eaves trough and conductor pipe has been reaffirmed, without change, for another year. A survey indicates that 94 per cent of the annual production of this commodity is in conformity with the simplified schedule. This simplified practice recommendation, as originally adopted by industry, reduced the varieties of the commodity from 21 to 16.

Reaffirmation of the simplified practice recommendation regarding roofing ternes has been announced, also. Adherence to this recommendation has been 95 per cent. It reduced the varieties of the commodity from nine to seven.

Simplified practice recommendation No. 47, on cut tacks and small cut nails, is now in effect, it has been announced by the division. This simplification, recently revised by the industry, originally reduced the variety of sizes from 421 to 182 and packing weights from 423 to 121.

Standardization of Tools and Machine Elements

The sectional committee on standardization of small tools and machine tool elements, which is organized under the procedure of the American Standards Association and sponsored by the American Society of Mechanical Engineers, the Society of Automotive Engineers and the National Machine Tool Builders Association, will hold its sixth annual meeting at the Engineering Societies Building, New York, Dec. 6, during the annual meeting of the A. S. M. E.

The work of the sectional committee is shared by 12 technical committees and includes the following standardization projects: Tee slots, their bolts, nuts and cutters; tool

holder shanks and tool posts; taper shanks and sockets for machine tools; spindle noses and collets for machine tools; milling cutters; and designations and working ranges for machine tools. Also, drill sizes; drill bushings; punch and die holders; circular form tools and holders; chucks and chuck jaws; and cut and ground taps.

Members of the executive committee are: H. E. Harris, consulting engineer, Bridgeport, chairman; F. O. Hoagland, Pratt & Whitney Co., Hartford, vice-chairman; J. A. Anglada, Anglada Motor Corporation, New York, secretary; C. W. Machon, Brown & Sharpe Mfg. Co., Providence; and C. W. Spicer, Spicer Mfg. Corporation, South Plainfield, N. J.

High Canadian Machinery Output in 1927

The output of the Canadian machinery industry reached its highest point in history during 1927 with a production valued at \$44,602,000, according to statistics which have just been made available by the Dominion Government, says a statement prepared by S. R. March, Industrial Machinery Division, Department of Commerce. This volume represents an increase of 16 per cent over the output value of \$38,380,000 in 1926, and 10 per cent over the previous record of \$40,535,000 established in 1920. Pulp and paper mill machinery led all the industrial machinery items.

General American Tank Buys Buffalo Steel Car Co.

General American Tank Car Corporation has acquired the plant and property of the Buffalo Steel Car Co., Buffalo. This plant is fully equipped for the building of modern steel cars and for the repair of general railroad equipment. The acquisition of the Buffalo plant will not require additional financing.

Record - Breaking Ingot Production Was Recorded in October. On the basis of daily averages, as well as total output, new high figures were made. Prices were fractionally better than at midyear

Highest Record in Steel Ingot Production

October Output Largest for Any Month—Total for Ten Months
Makes a New Record

PRODUCTION in October of open-hearth and Bessemer steel ingots in the United States, as reported by the American Iron and Steel Institute, established a new monthly record. The calculated output, at 4,647,891 gross tons, displaced the previous high record of 4,535,272 tons, made in March of last year. Only one other month, March, 1928, has exceeded 4,500,000 tons.

Not only was the aggregate larger than any previous total, but the daily output also reached a new high mark, in spite of the fact that there were 27 working days in the month. The figure is given as 172,144 tons daily, compared with the previous record of 172,103 tons, made in the 25 working days of last April. The daily rate has shown a steady increase, month by month, since 143,960 tons was registered in June. The gain since that time has been approximately 20 per cent.

For the 10 elapsed months of

the year, calculated production has reached 41,578,411 tons. This is the largest total for the first 10 months of any year. The largest previous total was reached in 1926, with 39,763,695 tons. The excess of 1,815,000 tons represents more than 4½ per cent. Inasmuch as the earlier figure included crucible and electric steel ingots, production of which in the first 10 months of this year may be estimated roughly at 340,000 tons, the real excess becomes about 5½ per cent. Compared with last year, an excess of about 12 per cent has been recorded for the first 10 months.

Open-hearth steel made another new record in October, with 3,802,396 tons reported by companies which made 94.68 per cent of the total open-hearth and Bessemer production last year. This would represent close to 4,000,000 tons on complete returns. The previous high record for open-hearth steel was made in March, 1927, when the reporting companies made

3,702,660 tons, and was closely approached in March of this year, on a report of 3,700,411 tons. Each of these last figures might be increased by 200,000 tons on complete returns. Bessemer output made the largest total of the past two years but, of course, was considerably lower than was achieved in the hey-day of the Bessemer process.

Total ingot production, including crucible and electric steel ingots, which no longer are reported monthly, would show a daily output for October of about 173,000 tons. With the same inclusions of crucible and electric steel ingots, the total October production would be about 4,675,000 tons and the 10-month production about 41,920,000 tons. Details of the first 10 months of 1927 and 1928 are covered in the table.

The 10,000th airplane number has been issued by the aeronautic branch of the Department of Commerce.

Progressive Administration Looked For

Hoover Faculty for Getting Things Done Expected to Benefit Business, Agriculture and Labor

WASHINGTON, Nov. 13.—The election of **Herbert Hoover** to the Presidency, aside from being interpreted as a favorable omen for business, has aroused interest in the specific policies that are likely to characterize his administration. It is expected that generally the Coolidge program will be followed, though with additional activities along economic lines and possibly with further reorganization of Government bureaus.

Mr. Hoover's past record discloses his sympathetic attitude toward agriculture and business, and the same may be said with regard to labor. The President-elect has a background that perhaps excels that of any of his predecessors in the White House when it comes to comprehensive understanding of domestic business and labor problems, as well as international issues.

That there will be a minimum of interference by the Government with legitimate business probably goes without saying. On the other hand, it would be a serious mistake if the view were entertained that a man of the type of Mr. Hoover would tolerate business that is not conducted on the high standards that he has always insisted it should maintain.

In aiding not only business, but agriculture, labor and other interests, indications are that Mr. Hoover will extend economic and statistical research well beyond his accomplishments in this direction as Secretary of Commerce, which really only followed lines that he had applied previously as food administrator, as an engineer and in other capacities. Assistance to business through cooperation with approved trade associations, through building up domestic and export trade, through standardization and simplification and through other avenues is held to give an index to expanded activities of this kind. The same may be said with regard to aid given to labor through plans he initiated for reducing unemployment and straightening out the business cycle. As President he will be in a position to increase such activities and at the same time give greater attention to other problems.

Indicative of this is his announced purpose of calling an extra session of Congress for the purpose of enacting legislation to aid agriculture, provided such legislation is not passed at the next regular session, which is held to be improbable. Mr. Hoover opposes Government price fixing of agricultural products, but would have the farmers themselves handle surpluses and achieve stabilization through a Federal Farm Board controlled by them.

There is a question as to whether the extra session, should it be called, would dispose of any other than agricultural legislation. Pressure might be brought to bear to have tariff and other legislation enacted, but it is believed such bills would be held over until the next regular session. It is the general opinion that Mr. Hoover will take up tariff legislation, not by piecemeal, but by means of an omnibus bill. This does not signify, however, that there will be a general marked revision of the present Repub-

lican tariff act. Instead it is thought that there will be a leveling out of inequitable features of the tariff duties and their administration. The steel schedule, for instance, probably would not be changed a great deal, though certain provisions may be changed in order to reconcile them with other provisions. Manufacturers of barbed wire, for example, are unable to understand why as a matter of justice this finished product should be carried on the free list when other products, including raw materials, are made dutiable. Of course, the explanation is that barbed wire was made free of duty as a sop to the farmers, but this is held to be no justification.

Believed to Oppose Flexible Provision of Tariff

Mr. Hoover, in the opinion of many, favors the elimination of the flexible provision of the tariff act under which the President, after investigation, may increase or reduce import rates of duty. It is the view that Mr. Hoover would like to see the power to make and change rates restored to Congress entirely and Congress evidently is in sympathy with that idea. Moreover, the new Congress will have an effective working majority favorable to the Hoover administration. Mr. Hoover is understood to favor retention of the Tariff Commission, but, it is said, he would confine its authority to fact-finding for the purpose of reporting to Congress only.

While there are those who think Mr. Hoover will eliminate a number of independent branches of the Government as being unnecessary, serious doubt is entertained by many that this will be done, though he is expected to effect reorganizations that will do away with overlapping and duplication of work. The Federal Trade Commission is expected to receive the support of Mr. Hoover, as are the Shipping Board, the Federal Oil Conservation Board and other independent branches, but it may be expected that such organizations as the Shipping Board will be relieved of certain administrative powers. The Federal Trade Commission at present is of an entirely different character than it was originally, and has become helpful, on the whole, to business, rather than being an irritant. For this reason it will probably not be disturbed

by Mr. Hoover unless he curbs some activities taken on its own initiative. The Federal Reserve system has operated so satisfactorily that no great changes are expected to be made in it. Regarding railroad legislation, Mr. Hoover is known to be favorable to consolidation within certain limits.

Hoover Responsible for 8-Hr. Day in Steel Industry

The support given to Mr. Hoover by many prominent leaders of organized labor during his campaign would indicate that labor generally is well disposed toward him. His aid to labor in working out plans to relieve unemployment has been an element in this direction. Mr. Hoover was unquestionably the moving spirit in the Harding administration who brought about the 8-hr. day in the iron and steel industry, not through legislation, but through cooperation with leaders of the industry. This fact also is well known to labor and remembered favorably. Mr. Hoover looked upon that accomplishment not only as being economically sound, but also as being altogether desirable socially and as a precedent for other industries. His efforts to solve problems in the coal industry developed a sympathetic attitude toward him generally on the part of both operators and miners. It is also true that his stand for restricted immigration has gained him warm support.

Efforts toward getting liberalized revision of anti-trust laws are expected to be made and it is conceivable that Mr. Hoover may favor such efforts to a limited degree. Organized labor itself is in favor of revised anti-trust legislation insofar as it would restrict judicial use of the power of injunction, and for this reason there are some who feel that if revised anti-trust legislation were attempted it would, while developing one side they favor, also develop another side that they do not favor. Because of this they have been hesitant about opening up the subject.

Speculative as present forecasts of the course of Mr. Hoover's administration are, it may be set down definitely that all important action taken will be upon his own initiative, for Mr. Hoover has well earned the reputation of being a strong character who takes personal responsibility for what is done under his authority. He will be President in fact, as well as in name, though freely seeking advice and cooperation. His cabinet is expected to be made up of men selected from fields that will fit them for their respective duties, well qualified to handle the domestic and international problems with which they will be faced.

Construction costs rose slightly in September to an index of 201, based upon 100 in 1913, according to figures of the Associated General Contractors of America. This is equal to the highest position the index has held in the last three or four years. It was at the same level a year ago.

This Issue in Brief

If parts are to be carburized, tell steel maker you want *normal* steel, for it carburizes faster than abnormal steel, metallurgists declare. In addition, soft spots will be avoided, and hardening will be more uniform.—Page 1220.

* * *

Flaws in steel rails located unerringly by direct-current device. Size as well as position of flaw is indicated by variation in current flow. Mounted on a car, the device detects flaws in installed rails.—Page 1214.

* * *

Cleaner cylindrical castings are obtained if pencil gates are used instead of bottom gate. The pencil gate keeps the metal agitated, thus forcing impurities to the top, instead of permitting them to cling to the side of the mold.—Page 1218.

* * *

Predicts slightly higher steel prices. Though Doctor Haney does not expect a "runaway market," he looks for a gradual increase in strength of steel prices.—Page 1228.

* * *

Life of galvanized articles is considerably increased by heat-treating, metallurgists find. Tests reveal that corrosion resistance of heat-treated materials, due to formation of iron-zinc compounds, created by heating $\frac{1}{2}$ hr. at 500 deg. C., is about 35 per cent higher, under the "simulated atmospheric test," than for untreated materials.—Page 1226.

* * *

Purchasing agent endangers interests of his own company and plays into hands of competitors if he pays a higher price than required, says convention speaker. Buying at lowest price is essential aim of purchasing. Ethics do not enter the situation; it is purely a matter of economics.—Page 1236.

Metal parts cleaned by use of trichlorethylene. When using this chemical solvent for degreasing, cleaning is done in three trays, one heated, next intermediate, and final for rinsing.—Page 1226.

* * *

Welded building is said to save 15 per cent of steel. Bolts were not used even to hold members in place for welding, in first retail store and office building to be welded completely. A square wood frame, bolted around the columns, provided means for attaching the braces.—Page 1224.

* * *

New durability test for galvanized coatings said to be faster and superior to salt spray test. In "simulated atmospheric corrosion test" specimens are exposed to an atmosphere of air, CO₂ and SO₂, saturated with water vapor at 120 deg. Fahr. Failure of coating is clearly shown within a few days.—Page 1226.

* * *

Cold shuts in large, intricate castings can often be avoided by using an equalizing gate. This keeps the metal in motion, preventing the formation of a crust in portions of the metal which would otherwise be at a standstill for a short time.—Page 1219.

* * *

No slackening other than seasonal in sight in the steel consuming industries, says Dr. Haney. Steel composite demand line continues at a high level and well above current output of steel.—Page 1227.

* * *

Welded structures are not yet on a price par with riveted, says Welding Society head. Nor has necessary skilled workmanship for welding structures proved available, he declares.—Page 1236.

New record established in steel ingot output. Calculated production in October was 4,647,891 gross tons, exceeding the previous record (March, 1928) by more than 100,000 tons. Output for first 10 months is over 41.5 million tons, $5\frac{1}{2}$ per cent above the 1926 record.—Page 1239.

* * *

Is abnormal steel caused by aluminum? If aluminum content is above 0.010 per cent the steel is almost certain to be abnormal, tests reveal.—Page 1220.

* * *

Steel scrap prices are near a peak, forecaster believes. "It seems likely that they will decline before the end of the year, even though some recovery from the recent setback may occur," says Dr. Haney.—Page 1229.

* * *

Steel fabricating industry's prospects are excellent, says Construction Institute head. New building contracts for 1928 will run about 7 per cent above those of 1927, and 1929 is expected to be better than 1928.—Page 1229.

* * *

Protects electric heating elements against oxidation by placing resistor coil inside a steel or copper tube in which is packed magnesium oxide. Tubes are swaged to pack the magnesium more tightly, and units are annealed, again swaged, and then formed to desired shape.—Page 1221.

* * *

Pig iron prices are likely to run higher during next two or three months before reacting, Dr. Haney says. High steel production warrants present rate of pig iron output, and as iron prices are low in comparison with steel scrap, he looks for further strength in pig iron market.—Page 1229.

ESTABLISHED 1855

Ten Years After

Nov. 11 passes into history as the world's Independence Day. Whatever other days may be made historic by the formal conclusion of treaties, the date of the ending of the World War marks the beginning of a new era. . . . Today government in Europe is in the making and in what form it will come out of the present chaos is beyond prediction. On all hands is the spontaneous expression that the first business of the United States is to relieve so far as possible the distress of the millions in Europe who are today on the verge of starvation.

SUCH was the beginning and ending of a brief armistice salutatory printed in *THE IRON AGE* ten years ago (Nov. 14, 1918). With what calmness may we now ponder things as we could hardly have done at any of the intervening anniversaries of the day.

When, in August, 1914, war crashed in Europe while we were yet clinging to the belief it could not be, the first reaction here was that a conflict was in progress that would be short but so disastrous for the nations involved, particularly the Central Powers, that the neutral world, cut off probably for some time from established contacts in international trade, would have to look to us in the interim. Industry thought then only in terms of peace time pursuits. No one was articulate to point out the resourcefulness and tenacity of nations in a struggle of supreme intensity. No one ventured to say how the whole world would shortly become an arena.

How different was the position of American industry thirty-two months later. Let us quote from *THE IRON AGE* of April 5, 1917:

The declaration by Congress finds the country able and willing to back the President with money without limit. Of metals there is no lack and will be none, but time alone can make ships and guns and munitions measure up to the need. The steel and metal-working industries may be depended on to respond to every call. . . . The Government's hand will be laid upon manufacturing and commerce, upon fuel and food supply, upon all the nation's activities in a way little dreamed of as the people have gone on in the even tenor of peace. Not only is the aloofness of the United States from old world political problems at an end, but a new day has come in the commercial and all other relations of this country.

And on April 12, 1917:

The country has entered upon the most momentous enterprise in its history. It knows little more today than that after a long period of rest from war it is now setting in motion its accumulated power in men, in money and in all the enginery of material resources. . . . No man can tell to what end the forces thus mobilized will come or when they will turn again to the pursuits of peace. The

people of the United States have grim business in hand, with social, economic, industrial, political and spiritual consequences beyond the power of any mind to measure.

Memory still is vivid of the truths of these words when the Armistice was signed. Immediately there came the need of a complete reversal of national effort as told by the quotation at the head of this summary.

There followed the years of gruelling readjustment, with bitter labor troubles in many directions, the strike of buyers against high prices and the distressing slump of 1921. Meanwhile, we have furnished much of the capital needed to put Europe on its feet. And now in November, 1928, we have back of us four consecutive years of virtually uninterrupted progress, a labor situation in the iron and steel trades and the metal-working industries that never was so good and an outlook without an ominous cloud. The ten years' record is highly creditable in every way.

Steering by Statistics

INDUSTRIAL statistical science received its impetus, if not its inspiration, from conditions arising during the great war. In the United States we are living today in an atmosphere of economic and industrial statistics. There should be no belittling of this development, which is perhaps the one great thing we got out of the war. As Mr. Hoover aptly illustrated in one of his official reports, our industrial statistics are analogous to weather reports and forecasts and enable adjustments to be made by individual action. Without any doubt, the work of the large number of industrial organizations, promptly revealing production, deliveries and stocks, has tempered fluctuations and has produced stability of markets and employment of labor as never before. This has been beneficial to everybody.

Industrial statisticians are the shock troops in the front line. Behind their line the general staffs of industry are necessarily engaged with analysis, coordination and consideration of the broader economic conditions. The latter have a natural tendency to lose sight of the fact that they are working in a new field, with new agencies, and with what are after all only fragmentary data. There is constant speculation, therefore, as regards the accuracy of many of the findings that are being reported, and the proofs of the deductions being made from them. Some of these certainly do not hold water.

With all its great strides since the war, the science is still too immature to afford sound basis for economic prophecy. Perhaps accurate forecasting will never be possible, for at any time human nature may play as great a part in determining future events as does the

balance sheet. It would have been, for example, beyond the power of economic science to prophesy a few years ago that the women of the world were going to curtail their clothing and thus cripple the textile industry.

We do not deprecate efforts to progress in interpretation and forecasting, but there is need for much more of fundamental data than exist at present before it will be safe to venture in that direction. We have no means as yet of knowing, uncontroversially, the approximate amount of our national income. We know even less as to our annual savings, and still less of our annual change in wealth. Either an individual or a corporation would need to have such information before doing any forecasting; and likewise must it be in respect to a national economy, i.e., the affairs of a whole people.

Study and research of such broad nature is not the business of the trade associations. Their functions are rather to make a statistical composite of all the factors in an industry and enable its several managers, individually and independently, to arrange for proper government. This is to say, it should not be expected that a constant survey of conditions will indicate a boom or a slump, but it may show whether an industry is overbuilt or underbuilt and whether it is producing too much or too little. In so doing the trade associations supply much valuable data that can be put together. Probably they can do a good deal more than at present. They might enter into such matters as plant capacity, employment of labor, etc. For assembling and interpreting such data there is need obviously for a coordinating and reviewing body. In the present state of the science, however, we are skeptical of the practicability of such an idea.

The President-Elect Travels

WE learn with great satisfaction of Mr. Hoover's intended trip to the principal South American States. It sets a precedent which may well be followed. Obviously as President he could ill afford the time for such a journey, important though it would be. As the president-elect, he will be just as welcome, and his visit as a distinguished citizen should have all the advantages with none of the disadvantages of an ostentatious state function.

In the future such a trip may well be imitated by President Hoover's successors. It will not only acquaint our chief executive intimately with the problems of our southern neighbors but will also give their leaders a first-hand appraisal of what manner of man we elect for our chief. This personal acquaintanceship will prevent many misunderstandings from arising, and help iron out differences of opinion which do crop up in international relations.

The opinion has been expressed many times in these columns that the future prosperity of our huge and expanding manufacturing industry rests in our ability to develop all the markets in the Western Hemisphere as well as we have cultivated the one at home. A good start has already been made by active international corporations, and by heavy investments in public bonds and South American stocks. It can continually be increased by greater good will between these nations and us. Such neighborliness will be mightily helped by international air mail and a "Pittsburgh to Patagonia" highway—both things we hope of the near future. For the present, we are sure that Mr. Hoover, in a swing

across the southern countries, will do even more than did Colonel Lindbergh to increase the friendly feeling which must ever be the first care of statesmen and business men.

Measuring Trade by Iron

IT used to be said that iron is the barometer of general trade. Nowadays, when mills are expected to be able to ship steel exactly when needed and there is no occasion for consumers to buy ahead or build up stocks, iron naturally is not barometric. It may still be thermometric by indicating what is going on, instead of giving warning of what is coming.

Is iron a measure of general trade activity? Doubtless it is at short range quite a measure. Beyond question if steel shipments run 10 per cent heavier or lighter than three months previous some decided changes have occurred at least in important parts of the things that make up general trade.

But how about the long range? This use of iron, including steel as a form of iron, as a barometer or thermometer is necessarily confined to those outside the iron and steel trade. Those within take what they have. They would not reason out to general trade and then reason from general trade back to their own business. Now it is a fact that these outsiders sometimes take "pig iron" as their measure and sometimes they take "steel" and the steel figure they take is that of steel ingots. Well, from 1913 to 1928 the production of pig iron has increased about 23 per cent while the production of steel ingots has increased about 63 per cent. Which measures general trade? Of course, neither.

There is a great deal more in it than that. We are only making a beginning when we pass from these raw or intermediate products to the really merchantable forms of iron, or steel, and summarize, as in the table below, which includes some official statistics and some estimates, only rough in the case of iron castings but reasonably comparative because they are proportioned to the production of foundry and malleable pig iron.

Merchantable Iron Products—Gross Tons

	1913	1928
Iron castings	9,000,000	9,000,000
Steel castings	1,020,744	1,100,000
Rolled iron	1,678,257	500,000
Rolled steel	23,112,986	36,000,000
Total	34,812,000	46,600,000

Here we have an increase of 34 per cent, which is quite different from the 23 per cent of pig iron or the 63 per cent of steel ingots. There is a greater increase in merchantable products than in pig iron because we are using a larger proportion of scrap than formerly, for two reasons, because more old material is coming out and because both in the steel mill and in the factories that work up steel into wares for final consumption a larger proportion of scrap is made. There is a smaller increase in merchantable products than in steel ingots alone because castings have not increased, because rolled iron has decreased, and because the proportion of rolled steel to ingots has decreased. In 1913 rolled steel was 76½ per cent of the ingot tonnage. Last year it was 74 per cent and for this year we estimate it at 73 per cent.

This 34 per cent is merely the correct measure if one wants to use tons at all. Trade activity has increased much more because there is much more activity

per ton. A ton of rolled steel consumed means much more activity than a ton of iron castings, and in rolled steel itself there has been a great change in the distribution among products. Steel rails have decreased, instead of increasing at all, but the railroads have 42 per cent more ton-mileage of freight this year than in 1913. It is true their passenger-miles have decreased about 5 per cent, but motoring has enormously increased, more than making up the difference as a representation of activity.

CORRESPONDENCE

Structural Steel for Residences

To the Editor: Steel is thought of by architects and engineers as the supporting element for great structures, but little thought is given to the possibilities of structural shapes for residences. However, there are several firms who are waking up to the fact that there is an opportunity to use thousands of tons of this metal annually in the homes and are producing for this purpose what is known as steel lumber. It has often been stated that in designing steel frame work for an office building to use an excess would be waste, while too little would prove a disaster. It seems that the present tendency of the steel lumber manufacturers is to avoid waste rather than have excess strength.

When we come to realize the vast life and property loss which occurs from such storms as the one at Miami two years ago and the Palm Beach storm recently, or the Santa Barbara earthquake and other disasters too numerous to mention, would it not be wise to consider structural steel as the proper framing material for residences?

It has been repeatedly demonstrated that a properly constructed steel frame building will withstand a wind pressure which would totally destroy any other form of construction. With these facts before us, it would not be considered waste, but rather sound business economy to use a liberal amount of structural shapes in cottages, especially where high winds are common.

The writer has in mind hundreds of cottages which were built in the storm stricken path of Florida five years ago at an average cost of \$3,000. These cottages have in many cases been completely wrecked or so nearly wrecked that rebuilding is the only recourse. The idea of using 20 tons of structural shapes in these cottages five years ago would have been considered absurd, as it would have added \$1,500 cost regarded unnecessary. Yet this cost would have been offset by saving approximately \$500 in other material displaced by the steel frame.

The total cost of the steel frame residence would have been \$4,000 instead of \$3,000. To rebuild the cottages demands another outlay of \$3,000, which means that each building has cost \$6,000 within five years, to say nothing of the loss of contents.

A somewhat radical departure from the conventional type of residence construction was recently designed, having a steel frame supporting reinforced concrete walls with a concrete slab roof waterproofed and finished in ornamental stone. The walls were finished in stucco, plaster or brick veneer to suit individual taste. Such buildings would have many points in their favor, being fireproof, cool in summer, warm in winter, without noise from wind, rain or hail and with practically no upkeep expense and capable of withstanding very high winds.

It would be an easy matter to adopt standardization in

Plates, shapes, merchant bars and pipe have increased less than the average in rolled steel. Seamless tubing, sheets and strips have increased much more than the average, and ton for ton they represent much more trade activity than the heavy products just mentioned. Even from 1926 to 1928, the two biggest years in steel, the detailed figures will indicate a greater increase in trade activity than the mere total of rolled steel, for even in two years the tonnage is running more to the finer products.

the fabricated steel frame work for various types of homes, and with the rapid progress in welding the problem of construction would be much simplified. With the ever increasing cost of lumber, the steel producer can do much toward increasing the sale of his products and benefiting humanity by inaugurating an advertising campaign for better homes of structural steel.

SAMUEL H. KENNEDY, Engineer.

Samuel H. Kennedy Co., Tunnel Hill, Ga., Nov. 5.

Loose Use of Export Terms Causes Complaint Abroad

Although most American exporters are precise and uniform in their interpretation of trade terms, prudence dictates amplification of those terms to avoid reasonable misunderstanding of them and resultant disputes with their foreign customers, says a statement issued by the transportation division, Department of Commerce. Attention has been called recently to cases regarding the loose use of export terms, which have caused importers abroad to complain that unlooked-for items are included in bills they receive.

For example, it was pointed out, an exporter quotes a price on a less-than-carload lot "f.o.b. New York," meaning free on board cars, New York. His foreign customer, however, interprets the term as meaning free on board steamer. Hence, later, when he receives a bill for the transfer of the goods at New York and perhaps for their storage there, he disputes its validity. This, it was stated, he does in good faith, for the term f.o.b. named port has no other significance abroad than free on board steamer. It is never understood there as meaning free on board cars, although it may be so understood in this country if the word "steamer" is not added.

"These differences with foreign customers manifestly tend to strain business relations rather than to promote them," said the statement. "Hence it is important to avoid them, and much can be accomplished in this direction through explicit language in dealings with foreign customers."

Strain Markings a Surface Effect

Henry S. Rawdon, senior metallurgist United States Bureau of Standards, has investigated the so-called Luders lines occurring in mild steel (*Journal of Research*, September, 1928). He finds that they appear on polished tension specimens when the metal starts to yield, and are a good indication of the proportional limit. The bands acquire a rippled surface which is responsible for the matt finish of the strain markings on the otherwise smooth specimen. Luders lines first appear near the fillets and gradually extend from the ends toward the center; no increase in the elastic properties by "overstrain" can occur until this has been accomplished. The hardness is increased about 5 per cent. X-ray and microscopic examination failed to show any significant difference between the crystals in the marked and unmarked metal.

Reinforcing Steel

Awards Amount to More Than 5300 Tons

AWARDS reported during the last week totaled slightly more than 5300 tons, but included no jobs requiring more than 750 tons. New projects, calling for only 1100 tons, were the lowest in several weeks. Awards follow:

BRIDGEPORT, CONN., 250 tons, warehouse for McKesson & Robbins, Inc., to Truscon Steel Co.
NEW YORK, 200 tons, addition to Union Trust Co. building at 66 Broadway, to Carroll-McCreary Co., Inc.
NEW YORK, 100 tons, building for Mosaic Tile Co. at 443 West Forty-first Street, to Kalman Steel Co.
JAMESTOWN, N. Y., 100 tons, Y. M. C. A. building, to a Buffalo maker.
GRAND RAPIDS, MICH., 190 tons, cold storage building for Pere Marquette Railroad, to two bidders.
STATE OF MICHIGAN, 100 tons, road work, to Concrete Engineering Co.
CHICAGO, 100 tons, Illinois State Ear, Eye, Nose and Throat Hospital, to Concrete Engineering Co.
CHICAGO, 700 tons, building for Olson Rug Co., to an unnamed bidder.
CHICAGO, 300 tons, building for Studebaker Corporation, to an unnamed bidder.
EVANSTON, ILL., 150 tons, building for Studebaker Corporation, to Inland Steel Co.
WAUKEGAN, ILL., 200 tons, apartment building, to Concrete Steel Co.
CHICAGO, 350 tons of rail steel bars, apartment building on Goethe and Dearborn Streets, to Inland Steel Co.
LOS ANGELES, 145 tons, laundry, South San Pedro Street, to unnamed interest.
LOS ANGELES, 200 tons, warehouse in Central Manufacturing District, to unnamed interest.

Industrial Activity Rising in Ohio

Employment in the iron and steel industries of Ohio during October gained slightly over September, the index standing at 102 with an average month in 1923 taken as 100, according to the current bulletin of the bureau of business research of Ohio State University. The increase from October, 1927, amounted to 16 per cent, while average employment in the first 10 months of 1928 was 1 per cent greater than in the corresponding months last year.

In the foundries and drop forgings group the October index of 87 is 3 per cent higher than the September index and 17 per cent higher than the October, 1927, index. The number of wage earners in the sheet metal works group was slightly less than in September, but 22 per cent greater than in October, 1927. The October employment index of 95 in the screw machine products and hardware group was 1 per cent more than the September index and 19 per cent more than the index for October, 1927. Employment in the machinery industries during October reached its highest point since June, 1927. The October index of 109 was 1 per cent higher than in September and 4 per cent higher than

SAN FRANCISCO, 140 tons, hotel, Geary and Maggie Streets, to Pacific Coast Steel Co.
OAKLAND, CAL., 140 tons, office building, Fourteenth and Franklin Streets, to Gunn, Carle & Co.
SEATTLE, 100 tons, office building, Fourth Street and Union Avenue, to Pacific Coast Steel Co.
SEATTLE, 130 tons, apartment building on Olive Way, to Northwest Steel Rolling Mills.
SEATTLE, 115 tons, hospital, Summit and University Avenues, to Northwest Steel Rolling Mills.
SEATTLE, 100 tons, bag plant for Pacific Coast Cement Co., to Northwest Steel Rolling Mills.
PORT TOWNSEND, WASH., 750 tons, second unit Zellerbach Paper Co. plant, to Pacific Coast Steel Co.
HOQUIAM, WASH., 750 tons, second unit Zellerbach Paper Co. plant, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BROOKLYN, 200 tons, Lincoln High School.
LACKAWANNA, N. Y., 100 tons, school; bids in.
CLEVELAND, 100 tons, Neal Fireproof Storage Co.
CHICAGO, 100 tons, Goldberg store on Milwaukee Avenue.
CHICAGO, tonnage not stated, two sewer projects.
CHICAGO, 300 tons, Board of Trade Building; Holabird & Root, architects.
WALLA WALLA, WASH., 100 tons, Veterans' Hospital; general contract to N. P. Severin, Chicago.
HELENA, MONT., 114 tons, bridge over Missouri River near Wolf Point; bids rejected.
SACRAMENTO, CAL., 206 tons, highway work in San Diego County; bids opened.

in October, 1927. The increase from September was shared by 63 of the 104 reporting companies.

For machine tool manufacturers the October employment index of 111 was 4 per cent greater than in September and 42 per cent greater than in October, 1927. Industrial employment in general in Ohio during October continued its upward trend, which started last January.

National Founders to Meet Nov. 21 and 22

The National Founders Association will hold its thirty-second annual convention at the Hotel Astor, New York, Nov. 21 and 22. At the afternoon session on Nov. 21 Virgil Jordan, chief economist, National Industrial Conference Board, will speak on "Business Prosperity and the Basic Industries," and Charles F. Abbott, executive director American Institute of Steel Construction, on "New Forces in Business." H. V. Crawford, General Electric Co., Schenectady, N. Y., will give an illustrated address on "The Automatic Blast Gate Control for Cupolas." On the program for the second day are a discussion of foundry salesmanship, by C. H. Hoffstetter, Odin Stove Mfg. Co., Erie,

Pa.; a paper on "What Foremen Should Think About," by L. P. Hartley, the association's director of industrial education, and a paper on "Melting Practice," by H. M. Lane, foundry engineer, Detroit. J. M. Taylor, 29 South LaSalle Street, Chicago, is secretary of the association.

European Cartel Quota May Be Increased

WASHINGTON, Nov. 13.—That the Continental Steel Entente will increase its present raw steel production quota of 29,287,000 metric tons annually, or 7,321,750 tons quarterly, is held to be probable by J. Joseph W. Palmer, Iron and Steel Division, Department of Commerce, in an article analyzing operations of the entente since it was organized 25 months ago. The view is expressed that the increased quotas will be provided beginning with the next quarter or the one immediately following. It is pointed out that the same quota has been in effect continuously since the opening of the third quarter of 1927, despite an apparent increase in the world demand for steel as shown by the greater margin by which the production quota of the entente is being exceeded, even in the face of penalties for overproduction.

Automobile Output Near Low Point for Year

NEW YORK, Nov. 13.—Automotive Industries this week will say:

"Output at the automobile factories is approaching the low point of the year, a renewed upward movement being scheduled to begin late this month or early in December, as plants now engaged in changes again come into operation. Due to Ford's activity, as well as that of several other large companies that are remaining in production, the current recession has not brought the level of operations below the best marks of previous years at this season.

"Truck production is declining in sympathy with the trend in car output, but the recession is proportionately much less, and sustained activity in trucks will help combined motor vehicle production in the two final months of the year to make a particularly good showing."

Coal Output Heavier

Production of bituminous coal in the week ended Nov. 3 is reported by the United States Bureau of Mines at 11,166,000 tons, and 11,248,000 tons was raised in the preceding week. These totals are 3 or 4 per cent higher than in the weeks just before and average 19 per cent above the corresponding two weeks of last year. Total production for the calendar year, through Nov. 3, was 408,533,000 tons, a drop of nearly 8 per cent from 1927.

Iron and Steel Markets

Steel Production Declines

November Fails to Maintain Record-Breaking Rate of
October—Sheets Marked Up \$2 a Ton—Further
Advances in Pig Iron—Scrap Weaker

STEEL production, although still heavy, has receded from the record-breaking rate of October. The reduced raw material needs of steel works have tended to relieve the tension in the pig iron market, notably in the Valleys, and have been reflected in another decline in heavy melting scrap at Pittsburgh—the third drop of 25c. a ton in three consecutive weeks.

Pig iron prices in territories where surplus stocks of steel company blast furnaces are not an important market factor continue to gain in strength. Advances of 50c. a ton have been made by producers in Buffalo, eastern Pennsylvania, southern Ohio and Michigan.

Steel prices, likewise, remain buoyant. Several independent mills have announced increases of \$2 a ton on sheets and \$1 a ton on sheet bars, which are likely to win general adoption. Bars, plates and shapes are expected to be marked up to 2c., Pittsburgh, or \$1 to \$2 a ton above current prices. With consumers well covered on their requirements through the rest of the year, the new quotations will apply principally to contracts for first quarter. While some inquiry for that period has appeared, especially sheet tonnage, inventory considerations and the volume of demand between now and the year end may affect the success of the advances.

The decline in steel output since October has not been sharp. In the Greater Pittsburgh district ingot production now averages 85 per cent, compared with a recent rate of over 90 per cent. Steel Corporation subsidiaries are operating at 80 per cent of capacity, against 85 per cent last week. Making liberal allowance for possible further recessions in output, total production for the year will be close to 50,000,000 tons, a gain of more than 6 per cent over the previous record, made in 1926.

November thus far has seen a gradual reduction in mill backlogs. The unfilled tonnage statement of the Steel Corporation for October, however, indicates that producers are well fortified for a less active market. Despite record-breaking output, the Corporation's unfilled orders on Oct. 31 showed a gain for the month of nearly 53,000 tons and also stood 67,000 tons higher than on the same date in 1926.

Further curtailment in the operations of the automobile industry has been a major factor in influencing the current trend of steel specifications and production, but some recovery is looked for in the motor car field next month, and generous first quarter inquiries for sheets and strip steel point to heavy automotive requirements next year.

Meanwhile, the outlook in other steel consuming lines is distinctly favorable. Railroad equipment purchases, totaling 6800 freight cars, mostly for Canadian roads, were the heaviest in many weeks. Structural steel awards, at 55,000 tons, were also unusually large. The rail buying movement brought out an order for 19,500 tons from the Burlington. Farm equipment makers, road machinery manufacturers and a wide miscellany of consumers continue to take steel at a virtually unchanged rate.

A gas line from Tulsa, Okla., to Lockport, Ill., requiring 60,000 tons of pipe, is reported placed with a Youngstown mill. A pipe line in Philadelphia will take 10,000 tons of plates, on which bids have been taken. Improvement in the oil industry is expected to result in a heavier demand for drill pipe and casing.

The rising trend of pig iron prices has brought out further buying for first quarter, as well as for current needs. Sales at St. Louis, at 46,000 tons, bring the total for the past two weeks to over 90,000 tons. A large part of this pig iron was basic grade for melters catering to the railroads. Bookings by Cleveland furnaces, at 55,000 tons, compare with 69,000 tons in the previous week.

Proposed advances in finished steel prices include an increase of \$2 a ton on wire products for first quarter delivery. Greater strength in cold-rolled strip is evidenced by the fact that the recent advance of \$2 a ton is holding and small tonnages are commanding 2.95c., Cleveland or Pittsburgh, a further increase of \$2 a ton. On the other hand, a softer situation in alloy steel bars is indicated by reports of 2.65c., base mill, a concession of \$2 a ton from recent quotations.

Steel ingot production in October established new records for both total output and production per day. The figure for the 31 days, 4,647,891 tons, compares with 4,535,272 tons in March, 1927, the previous record. The daily average, 172,144 tons, surpassed the rate of 172,103 tons of April, 1928, the former peak.

The lockout of German steel workers has been reflected in higher quotations on Continental steel by New York importers.

Another rise in THE IRON AGE pig iron composite price—the ninth in three months—has pushed it up to \$18.50 a ton, the highest figure since July, 1927. Last week it was \$18.34. Finished steel remains at 2.369c. a lb.

Pittsburgh

Demand for Steel Slows Up—Operations Slightly Reduced —Advances in Sheets and Some Grades of Pig Iron

PITTSBURGH, Nov. 13.—The heavy movement of steel against late September specifications and orders, which taxed the capacity of the industry in October, appears to have supplied a great many needs, and buyers are ordering with closer regard for definite requirements. In the Youngstown district steel output has dropped rather sharply. A month ago all facilities were fully engaged, while now the operation is about 80 per cent. In other sections of the Greater Pittsburgh district the drop has not been so great, but the general average is brought down by the loss in the Youngstown district. November and December are usually months of reduced consumption, and there is the further fact that inventory considerations come into play toward the end of the year.

Looking ahead, few see occasion for concern over the lull in specifications, orders and plant operations. Prospects are encouraging in a number of lines, among them the oil industry. Added to the expectation of additional tonnage for pipe lines is the possibility that the improvement in the oil situation will bring a better demand for drill pipe and casing soon after the turn of the year. The outlook for rolling stock orders is regarded cheerfully, and some business of that kind has already developed following a pe-

riod of pronounced inactivity. The agricultural implement industry has had one of the best years in its history, and there is nothing to suggest a lessened demand for steel from this source next year. As to motor car prospects, there rarely is a lack of optimism. Structural steel consumption this year has been running contrary to the idea that the country may have caught up with its requirements of offices, apartments, hotels, public buildings and bridges.

The general tendency of steel prices

is toward higher levels. Makers of bars, plates and shapes hope to see the market at a minimum of 2c., base Pittsburgh, and wire manufacturers are mentioning the possibility of an advance of \$2 a ton on first quarter contracts, while sheet makers have announced a horizontal advance of \$2 a ton.

Much of the recent buoyancy has gone out of the primary materials. It is noted that all steel companies are not now refraining from offering basic pig iron. That is a reflection of the fact that the urgency for deliveries of finished steel has abated sufficiently to bring about a lower rate of ingot production, which also has affected the scrap market. Heavy melting steel, which a few weeks ago was at \$18, has been sold at \$17 within the past few days and \$17.50 has become the top of the market. A lessened demand for spot coke for blast furnace use has brought an easier market.

Pig Iron.—Price ideas of producers still are somewhat above those of consumers, and business consequently is rather light and confined closely to actual and pressing needs. While a number of sales of foundry iron, some of them as much as 300 and 400 tons,

have been made at \$18, Valley furnace, these have been largely for immediate shipment, and the market remains untested both on sizable tonnages and for future delivery. Producers generally are quoting \$18, Valley furnace, for No. 2 grade for both prompt and first quarter shipment, but no considerable amount of first quarter business has been placed, and the price finds its principal basis in small-lot sales. There is therefore a prompt market of \$18, with the forward price yet to be determined. Although the common quotation on basic iron is \$18, Valley furnace, there is no clear-cut evidence that more than \$17.50 has been paid, and the market on this grade appears a shade weaker in that some steel company iron now is offered at that price. Recently all of the steel companies were unwilling to part with any of their surplus. Sales of malleable and Bessemer iron have been made up to \$18.50, Valley furnace, and offerings of these grades are so scant that it is doubtful if large tonnages now can be had at less than \$18.25.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50 to \$18.00
Bessemer	18.25 to 18.50
Gray forge	17.00 to 17.50
No. 2 foundry	17.50 to 18.00
No. 3 foundry	17.00 to 17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Wire Products.—This is usually a period of light demand, reflecting the tendency to keep stocks within bounds as the inventory season approaches. Prices are holding firmly, and there is talk of an advance of \$2 a ton on first quarter contracts.

Semi-Finished Steel.—Local and Youngstown makers of sheet bars have announced an advance of \$1 a ton on sheet bars, effective at once, and the quotation on this form now is uniformly \$34, f.o.b. Pittsburgh or Youngstown. As no change has been made in the base sizes of billets and slabs, which remain at \$33, sheet bars again are at a premium of \$1 a ton, as they were early in the year and for some time prior to that. The increase in sheet bar prices, coincident with one of \$2 a ton on all finishes of sheets, announced by a large inde-

pendent maker late last week, is expected to be followed by all other producers. It is evidently the purpose of producers to aid the finished sheet price advance by higher sheet bar prices. Higher sheet and sheet bar prices will find more application on first quarter business than upon tonnage to move over the remainder of this year, since the great majority of buyers are covered by contracts for this quarter. Movement of billets, slabs and sheet bars, while still good, reflects the fact that some of the urgency has gone out of the demand for the finished products in the past few weeks. Wire rods are steady at \$42, base Pittsburgh or Cleveland, and are moving well, notably to bolt and rivet makers.

Bars, Plates and Shapes.—Interest centers in the probable action of producers with regard to first quarter prices. Most of them have in mind a minimum of 2c., base Pittsburgh, which would be an advance of \$2 a ton over the price at which the bulk of the contract tonnage for this quarter was written. Much fourth quarter contract tonnage remains to be specified, because no small part of the movement of last month was on third quarter commitments or orders taken late in September for October delivery, but the clause in contracts calling for specifications by Dec. 10 is expected to be effective in ridding makers' books of these obligations by the end of the year. A considerable contraction in specifications has marked this month compared with October, the falling off being particularly notable in bars for cold-finishing. Local structural lettings are low in relation to those of the country as a whole. Pipe lines and barges in prospect suggest a broader market for plates a little later. The Mississippi River Commission will double next year its existing fleet of 150 barges, while the Inland Waterways Co. (Federal Barge Line) is expected to spend \$4,000,000 on new barges, and some of the private towing companies have plans for enlarging their fleets to be in shape to take advantage of the completion of the canalization of the Ohio River, which is expected during 1929.

Rails and Track Supplies.—Track fastenings continue to lag behind standards-section rails in sales. Some irregularity exists in spike prices, and while the open quotation remains at \$2.80, base, per 100 lb., sales at less are reported. Light-section rails are only moderately active and small spikes to go along with them are very slow.

Tubular Goods.—It is reported that the Texas Co. has closed for the 530 miles of 12¼-in. pipe for a gas line from Tulsa, Okla., to Lockport, Ill., and that the pipe will be furnished by Youngstown mills. Other oil and gas pipe line projects which have been discussed are not looked upon as likely to reach the mills this year, although all makers would welcome the business as a winter mill backlog. Tubular goods business as a whole is fairly active, although not particularly good in lapwelded oil country pipe, while inventory taking in the automotive industry has reduced the demand for mechanical tubing. Next year is expected to be decidedly better than this year in oil country pipe; oil prices are growing stronger and the statistical position of oil has improved sufficiently to create the belief that there will be an expansion in drilling in 1929.

Cold-Finished Steel Bars and Shafting.—A fairly good movement of screw stock bars still is reported on contracts, but new business is light. The heavy movement of October and the fact that inventories still are in progress among automobile companies account for the lack of large current purchases. Prices are steady at 2.20c., base Pittsburgh.

Hot-Rolled Flats.—Business in strips has not suffered much from the fact that the motor car builders are taking inventories or curtailing production preparatory to introducing new models. The new base prices and the new extras have not been seriously tested by demand, as most important consumers were under cover for this quarter when they were announced. The market, however, is firm, as few producers need business badly enough to sacrifice profits to get it. The quotable market is 1.90c., base Pitts-

Carbon Vanadium.....	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

burgh, for widths of more than 6 in.; 2c., base, for widths 6 in. and under, and 2.10c., base, for cut hoops of cooperation stock, embracing widths ½ in. to 1¼ in. in gages Nos. 17, 18 and 19.

Cold-Rolled Strips.—Makers still report business as good, but with less urgency for deliveries than in October. On current new business, 2.85c., base Pittsburgh, is the ruling price, and on small lots of steel of difficult specification 2.95c., base, is being asked and obtained.

Sheets.—Several but not all of the independent makers have adopted an advance of \$2 a ton on all finishes of sheets announced late last week by one producer. The leading interest is among the companies which has not yet formally announced a change in prices, but the companies which have not acted are not taking first quarter business below the new price and the impression is that the advance will become general before the week is over. Nothing has been said about prices of tin mill black plate, and the open quotation on long ternes remains at 4c., base, or 4.10c. for all primes. The latter price, however, represents a slight advance, the open prices, it develops, having been subject to shading. Business has fallen off considerably in all finishes of sheets in the past week, and this is reflected in a lower rate of mill engagement.

Tin Plate.—The price for the first quarter and first half of next year has not been formally announced, but the trade generally accepts the idea that the present price will be continued and that the cash discount will be brought into line with that on sheets and most other finished steel products, or to one-half of 1 per cent for cash in 10 days. Business is quiet, but no quieter than usual at this season. Mill operations are about 70 to 75 per cent of capacity.

Coke and Coal.—Some abatement in the demand for supplies of spot furnace coke to supplement contract shipments, together with a slight in-

crease in production, has produced an oversupply and slightly lower prices. While some sales of beehive oven coke have been made at \$2.90 per net ton at ovens, the more common price is \$2.85. Spot foundry coke is in less demand, but prices are not changed. The coal market is very dull and prices are largely in the hands of buyers. A few large producers here and, according to reports, in other districts are finding an outlet for most of their outputs, but a great many operators have to work hard to dispose of coal even at low and probably unprofitable prices.

Old Material.—The market continues to yield on the steel works grades; on heavy melting steel, \$17.50 now is the top of the market and it is available for delivery to some points in the district at \$17. Dealers are not offering more than \$17 to cover short sales at any point and in some instances are bidding only \$16.50. The open market on this grade is 25c. a ton lower than a week ago and 75c. below its level of three weeks ago. On the other hand, it is reported that the steel and long rails in the November list of the Baltimore & Ohio Railroad went direct to a Pittsburgh district mill at \$18.25. The bid on this scrap, it is believed, was influenced by a desire to prevent it from going to Youngstown, where a somewhat strained situation exists, due to the fact that a large melter placed too much dependence upon deliveries on low-priced contracts and suddenly found deliveries so small that heavy purchases for very prompt shipment were necessary. The general scrap price list is not much changed except in the open-hearth grades, but the general tendency is down, as it becomes evident that the steel makers will not have to buy much more scrap for this year's delivery.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$17.00 to \$17.50
Scrap rails	17.00 to 17.50
Compressed sheet steel.....	17.00 to 17.50

Rails 3 ft. and under.....	18.00 to 18.50

Chambers of Commerce Promote Foreign Trade

Speaking to secretaries representing 680 chambers of commerce throughout the United States at their annual convention in Nashville, Tenn., W. H. Mahoney, manager foreign trade bureau of the Merchants' Association of New York, declared that the growth of business in every section of the country is calling for more alert service and wider information on foreign trade.

"Under present-day conditions," he said, "technical information on foreign credits, banking, advertising, sales markets and legal conditions are as well organized and easily available for American business men as is the corresponding information on domestic business, provided they know where to obtain it. There are now 65 chambers of commerce that are fully able to tell them through a local foreign trade bureau; and each month, as new chambers see the light, there are several more."

New Tube Mills in Operation

The tube mills of the British American Tube Division, National Electric Products Corporation, which have been under construction on tidewater at Bayway, N. J., are now completed, and production of Blackskin condenser tubes and Bulldog brass pipe has begun. These mills replace those of the British American Metals Co., Inc., at Plainfield, N. J., which were destroyed by fire the early part of this year. The new mills have been designed to handle a capacity about two to three times greater than the mills that were destroyed, and equipment includes modern machinery, all of which is electrically operated.

Hollow Metal Doors, Frames and Trim

Simplified practice recommendation R82-28 of the United States Department of Commerce deals with hollow-metal, single-acting swing doors, and frames and trim for them. The pamphlet dealing with the matter is of 20 pages and copies may be obtained at 5c. each from the Government Printing Office, Washington.

Door sizes are listed from 2 ft. to 4 ft. in width, and 7 ft. in height, by variations of 3 in. in width. This makes a total of nine sizes, and of course the doorway openings, when the doors are used in pairs, would be double the widths of single doors. Clearances, gages of materials, template butts, mortise details, transom dimensions, as well as buck, jamb, casing and trim dimensions, are specified in the recommendation. This follows unanimous action, at a general conference Jan. 25 last, on the part of representative producers, architects, contractors and engineers interested.

Chicago

Steel Market Characterized by Steady Flow of Orders— Some Buyers Showing Interest in First Quarter

CHICAGO, Nov. 13.—The Chicago iron and steel market is characterized by a uniform steadiness in flow of new orders and specifications. Recessions in demand from some industries are offset by heavier releases in other directions, with the net result that specifications for finished materials are a shade heavier than a week ago and new sales total only slightly less than shipments. A few buyers are showing interest in first quarter requirements and some tonnage has been placed for that period. Although industry as a whole is well engaged, most buyers are looking to the future with conservatism, which leads them to take steel in such quantities that stocks are not accumulated except to assure supplies against slower mill deliveries.

Prices remain firm, with advances noted on some commodities. Sheets are marked up \$2 a ton and a stronger tone is apparent in the wire market. Scattered sales of pig iron have been made at 50c. above the general level of the market.

Noteworthy among rail purchases is 19,500 tons for immediate delivery. Chicago mills have taken 5000 tons from the Chicago, Indianapolis & Louisville and 50,000 tons from the Chicago, Milwaukee, St. Paul & Pacific. The Rock Island is seeking permission to extend its Missouri lines 85 miles. Fresh railroad equipment inquiries include 600 underframes, 850 freight cars and 67 locomotives.

Pig Iron.—November shipments of Northern pig iron are holding to the rate of October, which was the best month in more than two years. Sales remain active at \$20 a ton, furnace, except for carlots where close analysis and prompt delivery are wanted. For business of this kind several sellers are asking \$20.50. Many users have already specified fourth quarter contracts in full and are now buying fair tonnages to meet needs for the remainder of this year. Additional tonnages have been sold for delivery in the first quarter. Sellers are not anxious to quote for shipment beyond that time. Prices for silvery are strong and tonnages for immediate delivery and shipment in the first quarter are taken subject to confirmation. The position of charcoal furnaces is strengthened as shipments and sales are fully equal, to production. Southern iron quotations are strong at \$16.25 a ton, Birmingham.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	20.50
Malleable, not over 2.25 sil.....	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$29.00 to 29.50
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market remains moderately active in sales. Most users of ferrosilicon and ferromanganese are covered for 1929. Scattered sales of spiegeleisen are reported at \$33, Hazard, Pa.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Plates.—The railroad equipment market remains active, and deliveries on plates, especially in the narrow widths, are extending. Wide plates may be had in two to four weeks, but in the week several car shops have started on the production of new car programs and their specifications at the mills have pushed ahead deliveries on narrow plates to three to five weeks. A Pittsburgh car builder and Canadian shops have benefited by orders for cars from the Canadian National and Canadian Pacific. An order for 1000 refrigerator cars will take about 11,000 tons of steel. Among fresh inquiries is one for 600 underframes for the Pacific Fruit Express. Miscellaneous buyers of plates are using liberal quantities, though they still prefer to place orders for as nearby as deliveries will permit. The Empire Gas & Fuel Co. and the Texas Corporation have organized the Texas-Empire Pipe Line Co., which intends to build a 600-mile line from the mid-Continent fields to Chicago. The line, which is to be of 12-in. pipe, will be ready for operation by the middle of 1929. Fresh oil storage tank inquiry from the Southwest totals over 6000 tons. Chicago prices for plates remain strong in the range of 2c. to 2.10c. However, competition in the Southwest is keen and prices named for delivery in that direction are below the local market.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Demand for mild steel bars remains large, though several industries are in need of smaller quantities. Forgers, following the lead set by the automobile builders, are issuing smaller specifications. On the other hand, farm implement manufacturers' requirements are a shade larger and releases by car shops are tending to offset the loss resulting from curtailment of automobile output. Road machinery builders are fully engaged and find that at this time of the year, when they usually produce against a possible spring demand, they have unfilled orders that in at least several instances will provide work for eight or nine months. Deliveries of mild steel bars are a trifle easier, the range now being three to five weeks.

Prices remain firm over the spread of 2c. to 2.10c. per lb., Chicago. The iron bar market is quiet; prices range from 2c. to 2.10c., Chicago. Demand for alloy steel bars is steady, representing output at about 75 per cent of local mill capacity. First quarter books have been opened at base prices that range from 2.65c. to 2.75c. per lb., maker's mill, depending on the size and character of the order. Barn equipment manufacturers are operating at capacity and are pressing for deliveries of rail steel bars. The bed industry, now in the midst of its annual exposition, is finding larger specifications necessary to meet current requirements. Both Chicago Heights mills remain on double turn and deliveries range from two to four weeks. Prices for hard steel bars are firm at 1.95c., local mill.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Cast Iron Pipe.—For the most part, bond issues survived the recent election and sellers of cast iron pipe are looking forward with confidence that spring pipe laying programs will be large. Purchases by railroads are more liberal, several running as high as four carloads each. Contractors in this district are finding use for additional pipe and orders from this source total more than 1000 tons. Dayton, Ohio, is said to have divided 300 tons of cast iron pipe between the American Cast Iron Pipe Co. and the United States Cast Iron Pipe & Foundry Co. Prices are strong, and sellers are asking \$38 a ton, Birmingham, on small orders for diameters 6 in. and larger.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$45.20 to \$46.20; 4-in., \$49.20 to \$50.20; Class A and gas pipe, \$4 extra.

Structural Material.—Structural awards for the week total about 1800 tons. Of these, the largest was 700 tons for a steel mill building near Chicago. Several months following the announcement that the Chicago Board of Trade would build, plans are now out and the original estimate of the steel tonnage needed is revised upward to 15,000 tons. Fresh inquiries are lagging, but the pending list is imposing, and fabricators report that they are getting an unusually large number of calls from architects who have numerous projects that are getting under way. Numerous small lettings plus several large ones have filled in the gaps in shop schedules and it is evident that fabricators in this district face the approach of the winter months with a fair degree of confidence and with shops as well filled as at any time this year. Of special note is the increased activity in awards and plans for mill type buildings. It is probable that a contract for 800 tons for a garage in Milwaukee will be let this week. Prices for fabricated materials remain low on all classes of work except that which calls for small tonnages.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Wire Products.—Little change has taken place in this market in the week. Producers continue to hold stocks in good balance and shipments are fully up to current mill output, which stands at 65 per cent of capacity. The jobbing trade now is up to expectations at this time of the year. This is not due, however, to a quickening of demand, but rather to a steady flow of orders which did not swing upward, as is customary in October, but which now match well with the volume of business in the corresponding months of previous years. The announcement of spring terms on woven wire fencing has stimulated orders for this commodity, especially in the Central West and in the Northwest. Specifications from the manufacturing trade are well sustained except from manufacturers of automobiles and makers of parts. Prices for wire and wire products remain steady. It is probable that first quarter books will be opened about Nov. 20.

Rails and Track Supplies.—The Burlington has ordered 19,500 tons of standard-section rails for immediate delivery. The order was split as follows: Inland Steel Co., 4500 tons; Illinois Steel Co., 9500 tons, and the Colorado Fuel & Iron Co., 5500 tons. Outstanding inquiry for rails which will come to Western mills totals not less than 100,000 tons. Track accessory inquiries are heavy, aggregating fully 30,000 tons. Purchases of track supplies total 7000 tons, including 1000 tons of iron tie plates. Output of Chicago rail mills is unchanged. Orders for light rails are in carlots only.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—This market is quiet, with spot sales bringing full market prices. Specifications are equal to output at 65 per cent of capacity.

Wire Rods.—Shipments of this commodity are steady, and prices are firm at \$43, Chicago mill.

Old Material.—The Chicago scrap market is held in check by recent heavy purchases and the influence of lower prices to the East. Dealers' opinions as to the tendencies of the market are mixed, though it is not uncommon to hear the statement that the top has been reached. Buyers are resisting present quotations and railroads are taking lower prices for items on their lists. Mills are inspecting shipments more closely and the number of rejected cars is more numerous. Prices for cast iron borings are lower, following a 5000-ton purchase at \$12 a gross ton, delivered. Cast iron carwheels are being taken only in single carloads by small users, but a more rapid movement of this grade is expected as the railroad equipment market becomes more active. A favorable condition in this market is the sustained rate at which users of scrap are operating. Lists are being offered this week by the Wabash, Pere Marquette and the Chesapeake & Ohio.

*Prices deliv'd Chicago district consumers
Per Gross Ton*

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraul. compressed sheets	12.50 to 13.00
Drop forge flashings.....	10.50 to 11.00

No. 1 railroad cast.....	14.50 to 15.00
No. 1 agricultural cast.....	14.00 to 14.50
Stove plate	11.75 to 12.25
Grate bars	12.50 to 13.00
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Tin Plate.—With the contract period close at hand and prices firm, there are further reports of a probable advance in prices. Inquiry on the Pacific Coast is heavy for delivery this year.

Coke.—First quarter books for by-product foundry coke are open at \$8, local furnace, and at \$8.75 a ton, delivered in Chicago. Shipments are heavy. All ovens in this district are lighted.

Sheets.—Chicago producers of sheets have advanced prices \$2 a ton. The new prices apply on orders for immediate specification. First quarter books have not been opened. Most of the old contracts have been taken out, but the flow of new orders is large and steady and hot mill output is well sustained at 85 per cent of capacity. Deliveries range from three to four weeks.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c. to 3.00c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Reinforcing Bars.—Shipments from local shops are heavy and, in the absence of sizable new awards, output appears to be destined for sharp curtailment before the end of the month. Two sewer projects for the west side of Chicago may bring a round tonnage of reinforcing bars into the market. The 700 tons recently reported on inquiry for the Cook County Hospital nurses' home is postponed because a bond issue failed to pass at the recent election. Efforts by sellers to raise prices are meeting with no success because of keen competition to take the few current awards. A fair number of small tonnage orders have been placed during the week. A new rail steel bar mill soon will be put in operation in Chicago by a local reinforcing bar dealer.

Reading Electrification to Be Begun in Spring

As a first step in a program of electrification of the Reading Railroad lines to New York, Bethlehem and through the Schuylkill Valley, the Reading Co. announces that it will immediately begin electrification of its system in metropolitan Philadelphia. Sanction has been given by the board of directors for immediate work on the lines from the Reading Terminal in Philadelphia to Lansdale, from Glenside to Hatboro, from Jenkintown to Langhorne and the Chestnut Hill branch, at a cost of about \$20,000,000. Weather permitting, work will be begun in March and will require about three years for completion of the metropolitan section. At Wayne Junction a large coach storage yard and electrical repair shop will be erected and at Chestnut Hill a storage yard will be provided.

Philadelphia

Advance of \$2 on Sheets—Plates for Local Pipe Line May Be Furnished by Pittsburgh Mills

PHILADELPHIA, Nov. 12.—New steel business is rather small, but shipments on contracts are in good volume and prices continue firm, with sheet mills in this district preparing to follow the action of Youngstown producers in advancing prices \$2 a ton on black, galvanized and blue annealed for prompt shipment and first quarter contracts. Some substantial plate business is in the market, but with the prospect of the fabrication being awarded to contractors in other districts not much of this tonnage is expected to come to eastern Pennsylvania mills.

The pig iron market is strong, but consumers have not yet begun to cover first quarter requirements of foundry iron, with the exception of the American Radiator Co., which has bought a tonnage for its Gloucester, N. J., plant. The iron and steel scrap market is inactive and prices show a continued downward tendency.

Pig Iron.—Eastern Pennsylvania producers are maintaining prices on foundry iron for delivery over the remainder of the year at \$20.50 per ton, furnace, and at \$21 for first quarter. Some small tonnages have been sold for next year's delivery at \$21, but the price has not yet been tested on a large tonnage, except for a purchase by the American Radiator Co. of about 4000 tons for its Gloucester, N. J., plant, placed with an eastern Pennsylvania furnace. In a number of instances, consumers have not yet estimated their requirements for the next quarter, as at present rates of consumption their contracts will carry them over the turn of the year. Basic iron is quiet; about 20,000 tons inquired for by a Coatesville, Pa., mill has not been placed. Demand for low phosphorus is fairly active in other districts, but nearby consumers are not operating at a very high rate.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.		\$21.26 to \$21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.76 to 22.26
East. Pa. No. 1X.		22.26 to 22.76
Basic (del'd east. Pa.)		19.75 to 20.00
Gray forge		20.00 to 20.50
Malleable		21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)		22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)		23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.		24.54
Va. No. 2X, 2.25 to 2.75 sil.		25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Some large consumers have not covered their requirements for next year. Producers report that most of the contracts written are for delivery over the entire year, only a few buyers limiting their purchases to the first half. Quotations are \$105 per ton, seaboard, by both domestic and British producers.

Bars.—Shipments on contracts are good, but new buying is for the most part of carload lots or less. A small tonnage of bars for a Grace Line ship was placed by the New York Shipbuilding Corporation, Camden, N. J., with the Bethlehem Steel Co. Prices are unchanged at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia.

Shapes.—New buying is small, but

prices are firm at 2.05c. per lb., f.o.b. nearest mill to consumer, or 2.11c., Philadelphia, with Pencoyd, Pa., as the base for this district. About 1300 tons of shapes required for a Grace Line ship being built by the New York Shipbuilding Corporation, Camden, N. J., has been placed with the Bethlehem Steel Co. The low bidder on four ships for the Export Steamship Corporation, New York, requiring about 4000 tons of shapes, was the Spear Shipbuilding Co., Newport News, Va., with the next lowest bid by the Sun Ship Building Co., Chester, Pa.

Plates.—Substantial tonnages required for shipbuilding and pipe fabrication may not go to eastern Pennsylvania mills. About 13,500 tons of plates will be needed for four ships, on which the Spear Shipbuilding Co., Newport News, Va., was low bidder. The lowest bid for the pipe line at Lardner's Point, requiring about 10,000 tons of plates, was submitted by Peter & A. J. Ellis, Inc., Philadelphia, reported as using fabricated quotations of the Witt Humphrey Steel Co., Greensburg, Pa. Shipments against fourth quarter contracts are good, and prices continue at 2.05c. to 2.15c., Coatesville, or 2.15c. to 2.25c., Philadelphia.

Sheets.—Mills in this district have not yet followed the advance of \$2 a

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

ton on sheets for the rest of this year and first quarter, made by Youngstown makers, but are expected to take action in a few days. This would bring quotations to 2.85c., Pittsburgh, or 3.17c., Philadelphia, on black; 3.60c., Pittsburgh, or 3.92c., Philadelphia, on galvanized, and 2.10c., Pittsburgh, or 2.42c., Philadelphia, on blue annealed. It is apparently the intention of most producers of blue annealed to eliminate the extra 10c. per 100 lb. for 45-in. and wider, although no announcement to this effect has been made by the mills. New business in sheets is small, but shipments on contracts are large.

Warehouse Business.—Buying has been decidedly smaller than last month. Prices, however, are being maintained.

Imports.—In the week ended Nov. 10, 1501 tons of pig iron was received at this port from British India. Steel arrivals consisted of 431 tons of structural shapes from Belgium and 78 tons from France, 40 tons of steel bars from Belgium and 98 tons from Germany, 6 tons of steel bands from Belgium, 28 tons of steel scrap from the United Kingdom and 6 tons from Germany.

Old Material.—Eastern Pennsylvania consumers are buying little scrap, and prices continue their downward trend. A Harrisburg mill is offering \$12.50 per ton as a maximum for yard grade of heavy melting steel and stove plate. A buying agent for a Phoenixville mill is paying \$11 to \$11.25 per ton for machine shop turnings and \$12.50 per ton for yard grade of heavy melting steel. No. 1 cast scrap has been bought by an eastern Pennsylvania user at \$16.25 per ton, delivered, a decline of 50c. a ton from the price at which a sale was made a week or so ago. Specification pipe and chemical borings are freely offered by dealers at \$15 per ton; delivered. A tonnage of blast furnace scrap is reported to have been closed at \$11 per ton, delivered to a Coatesville, Pa., consumer. No. 1 heavy melting steel is inactive, following purchase of a small tonnage a week ago at \$15.50 per ton.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.50 to \$16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.00 to 11.50
Machine shop turnings (for steel works)	11.00 to 11.25
Heavy axle turnings (or equiv.)	12.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	16.00 to 16.50
Railroad grate bars	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	21.50 to 22.00
No. 1 forge fire	12.50 to 13.00
Cast iron carwheels	16.50
No. 1 cast	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling	15.50 to 16.00

Cleveland

Slight Slowing Down in Demand for Steel—Sheets Advanced \$2 a Ton—Pig Iron Higher

CLEVELAND, Nov. 13.—Specifications for finished steel declined the past week and the volume of orders so far this month is somewhat below that of the corresponding period of October. Some of the mills have caught up a little on deliveries, but others report no improvement in that respect. Orders from the automotive industry show quite a decrease. Some of the motor car companies have slowed down production to take inventories and bring out new models and others evidently have cut production because of the seasonal decline in the demand for cars. Renewed buying from this source is looked for late this month and early in December. Unable to get steel as promptly as recently, the automotive industry is already showing an interest in first quarter contracts. Some inquiries have come out from that source for sheets and strip steel for the coming quarter.

Inquiry in the structural field includes 6500 tons for a hangar for the Good-year Zeppelin Corporation, Akron. The Manitowoc Shipbuilding Co. is inquiring for 400 tons of plates for ship repair work.

Interest in the price situation is centered in a \$2 a ton advance by some makers of sheets and the naming of the recently advanced price on cold-rolled strip for the first quarter. Steel bars, plates and structural material are holding rather firmly at 1.95c., Pittsburgh. Outside mills using a Cleveland base are quoting steel bars at 1.95c. to 2.05c., Cleveland, and are able to take much of the small-lot business at the higher price. The local mill price on steel bars is 1.90c., Cleveland.

Pig Iron.—Buying for the first quarter continues heavy and a further price advance to \$19, furnace, has been made on foundry and malleable grades by a Lake furnace interest for western Ohio and Indiana shipment. In Michigan, where a week ago there was a range of \$19.50 to \$20, the market has firmed up to the higher price and furnaces are now endeavoring to get 50c. a ton additional for malleable, which has been selling in that State at the same price as foundry iron. The Cleveland furnace price is unchanged, being \$18.50 for outside shipment and \$19 for local delivery. Several good-sized lots were sold at these prices during the week. Sales by Cleveland furnaces included a 2000 ton lot taken by an Indiana melter. Sales by Cleveland interests totaled 55,000 tons the past week. No activity is reported in basic iron. The American Steel Foundries is inquiring for 3000 to 5000 tons of basic for its Alliance, Ohio, plant for the first quarter. On basic iron, \$18 is the common Valley furnace quotation. The Trumbull Cliff furnace, Warren, Ohio, which has been out about two weeks for repairs, will be relighted this week. The stack of the Struthers Furnace Co. is scheduled to go in blast about Dec. 15. Shipments continue heavy.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	22.25
Malleable	19.50
Ohio silvery, 8 per cent.	28.00
Basic Valley furnace	\$17.50 to 18.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Shipments of Lake Superior ore by water this year will be close to 54,000,000 tons, or nearly 3,000,000 tons more than last year, when the movement was 51,107,136 tons. Shipments in November are expected to amount to at least 4,000,000 tons. Shipments to Nov. 1 were 49,719,931 tons. Several of the ore firms will ship their last cargoes this week, but others will not clean up until the end of the month. The amount of ore on docks Nov. 1 was 6,472,840 tons, compared with 7,211,474 tons on the corresponding date last year. Receipts at Lake Erie docks during October were 6,002,275 tons and for the season 33,343,785 tons. October shipments from these docks amounted to 4,046,055 tons and for the season until Nov. 1 23,526,093 tons. Receipts at other than Lake Erie ports, mostly Lake Michigan ports, were 2,580,050 tons during October and 14,900,813 tons for the season up to Nov. 1.

Semi-Finished Steel.—A \$1 a ton price advance to \$34, Cleveland and Youngstown, has been made on sheet bars, billets and slabs by the Corrigan, McKinney Steel Co. The advance will apply to very little business during the remainder of the year, as most consumers are under contract and the Cleveland mill will have only odd lots to sell during the remainder of the year. However, the advance indicates that consumers will have to pay a higher price during the first quarter. There has been no letup in the heavy volume of specifications.

Sheets.—A price advance by some mills of \$2 a ton is to apply on current orders and on first quarter con-

tracts. The advance is expected to be generally adopted. With the advance the \$2 a ton extra for blue annealed sheets 45 in. wide and over is withdrawn. The advance will not apply to much last quarter business, as most consumers are covered for the remainder of the year. The new prices are 2.85c., Pittsburgh, for black, 2.10c. for blue annealed, 3.60c. for galvanized and 4.10c. for automobile body sheets. Specifications from the automotive industry show a falling off, and some of the mills can make better deliveries than recently. However, deliveries are still quite extended, and some mills are filled up with full finished sheets until the latter part of December. Considerable inquiry for the first quarter has come out and there is a fair current demand, buyers wanting quick shipments.

Strip Steel.—The current prices on hot-rolled strip of 2c., Pittsburgh, for widths to 6-in., inclusive, and 1.90c. for wider material, with the new card of extras, have been adopted by some of the mills for the first quarter and others are expected to fall in line. Some producers have announced a range of from 2.85c. to 2.95c., Cleveland and Pittsburgh, on cold-rolled strip for the next quarter, the lower price being for round lots. Consumers covered for the present quarter at 2.75c., but the price was recently advanced \$2 a ton and some of the mills have been charging 2.95c. for small lots. While specifications are not as heavy as recently, mills still have good backlogs.

Cold-Finished Steel.—Specifications have declined somewhat as a result of a slowing down in the automotive industry. There is talk of a \$2 price advance for the first quarter.

Reinforcing Bars.—On attractive orders 1.85c., Cleveland, is still being quoted. Inquiry is rather slow. Following its advance to 1.90c., mill, for rail steel bars, one producer has established a new 2c. base for ¼-in. and 5/16-in. sizes.

Warehouse Business.—Steel bars, plates and structural material are moving in good volume. Jobbers are getting orders for larger lots than recently, evidently because of slow mill deliveries. Sheet orders have fallen off. Prices are firm.

Wire Products.—The nail market has a firmer tone, and those manufacturers who have adhered to the \$2.55 per keg price, Cleveland and Pittsburgh, are having less difficulty in making sales at that price than recently. Some are now adhering to the 10c. differential or \$2.65 per keg for car lots to others than jobbers. For some time this differential has been quite generally ignored. Wire is firm.

Coke.—Foundry coke shipments against contracts are fair, but there is little new business. Prices are unchanged at \$3.75 to \$4.85, ovens, for Connellsville coke and \$7.75, Painesville, for Ohio by-product coke. By-product coke for domestic use is active and firm at \$4.50, Ohio ovens, for egg size and \$6, delivered Cleveland.

*Net base, including boxing and cutting to length.

Old Material.—While a decline in prices in the Youngstown and Pittsburgh districts has had a sentimental effect on the local market, Cleveland prices so far have not receded from the recent levels. The apparent reason for this is that these prices did not advance to the extent they did in Pittsburgh and Youngstown. Local dealers paid during the week the range of prices previously and now quoted for scrap to fill outstanding orders for Cleveland delivery. For Valley shipment, they are paying \$16.50 to \$17 for heavy melting steel, a reduction of 50c. a ton. Scrap offerings are more liberal and some of the mills are again regulating shipments. Mills are showing little interest in the market, although a local consumer purchased a small tonnage of heavy melting steel the past week. Reflecting the strength of the pig iron market, cast scrap is very firm.

New York

Pig Iron Prices Show Added Strength—Bridge to Take 26,500 Tons of Steel

NEW YORK, Nov. 12.—Pig iron buying continues at a good rate, and prices show added strength. Foundry iron sold on a Buffalo base is now commonly bringing \$18, or 50c. a ton above the recent minimum. The movement of iron by barge from Buffalo has virtually ceased, and producers that established yards at New Jersey ports have failed to accumulate any appreciable stock in excess of present obligations. Supplementary purchases of pig iron for this quarter are still in good volume, and buying for first quarter is on the increase. Sales in this district for the week totaled over 13,000 tons. The New York Air Brake Co. has closed against its inquiry for 750 tons for Watertown, N. Y. The American Radiator Co. has bought 4000 tons for its Gloucester, N. J., works, and is in the market for the first quarter requirements of other plants. The Worthington Pump & Machinery Corporation is inquiring for 2605 tons for delivery through the next five months. Included in the total are 450 tons of foundry and 50 tons of Bessemer for Elmwood Place, Ohio; 275 tons of foundry and 350 tons of Bessemer for Harrison, N. J.; 580 tons of foundry and 150 tons of Bessemer for Holyoke, Mass., and 750 tons of foundry for Buffalo. A Connecticut melter wants 1500 tons of foundry for first quarter shipment. The Thatcher Co., Newark, N. J., is sounding out the market for considerable tonnage. Following a sale in this district of 300 tons of Dutch foundry for next quarter, quotations on that iron were advanced 50c. a ton to \$22, duty paid, port of entry, for No. 1X and lower grades. The American Radiator Co. expects to blow in its

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Contracts for ferromanganese for delivery through 1929 are reported by some dealers to be coming in quite liberally. The price is firm at \$105, seaboard. There is some business in carload and small lots at the same price for delivery this year. Very little is heard of contracting for spiegeleisen for any part of next year's delivery, and business at present is confined to carload and small lots at unchanged prices.

Reinforcing Bars.—The Delaware, Lackawanna & Western Railroad Co. has not yet purchased the 8500 tons of bars required for its terminal warehouse at Jersey City, but action is expected soon. Another large tonnage may be placed shortly as a result of the formal award of the contract on the water tunnel in Manhattan for the New York Board of Water Supply to Patrick McGovern, Inc. The job calls for 2850 tons. Lettings in the past week have been small and the volume of new work coming out for bids is seasonably light. Prices show considerable strength. This was evidenced recently when a buyer requiring a carload of bars in odd lengths was un-

able to purchase them out of mill warehouse for less than 2.25c., Pittsburgh, and finally revised specifications to call for standard mill lengths of 40, 50 and 60 ft., which were available at 2c., Pittsburgh. Out of New York warehouse, distributors are quoting 2.80c. per lb. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons, and 3.24c. for less than 2 tons, all delivered at job.

Plates, Shapes and Bars.—Specifications against contracts make up the bulk of current business, but these are at a fairly good rate. Eastern structural and plate mills continue at a

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

high rate of operations, though demands are less insistent, except perhaps in the case of structural steel for work now under construction, than they were a month or so ago. An advance in prices on these products is predicted for first quarter, and the general opinion of the trade is that 2c., Pittsburgh, and 15c. per 100 lb. higher at Eastern basing points, will be named as a minimum. No official announcements have been made, however. Bids will be taken Nov. 19 on 26,500 tons of fabricated steel for a bridge to connect Staten Island and New Jersey and bids will be received this week on a subway section calling for 3670 tons. Steel for the Chrysler Building, Lexington Avenue and Forty-second Street, is reported to have been let to the American Bridge Co., the final plans calling for 15,600 tons. The Structural Steel Board of Trade of New York reports that 50,300 tons, exclusive of bridges, subways, etc., was placed under contract in the metropolitan district in October, a sharp increase over the 39,000 tons of September, and comparing with 29,000 tons in October, 1927.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Sheets.—Local sales offices of some of the independent mills have received notices of an advance in prices of \$2 a ton on all grades of sheets, making black sheets 2.85c., Pittsburgh, galvanized 3.60c., blue annealed, 2.10c., and automobile body sheets, 4.10c. These prices are to take effect at once, but will apply particularly on first quarter orders.

Warehouse Business.—With a sizable tonnage of material being shipped from warehouse stocks, this month will apparently compare favorably with October. Occasional concessions still appear in sales of black and galvanized sheets. Demand for structural steel and bars continues large.

Cast Iron Pipe.—Northern makers of pressure pipe have advanced their quotations \$2 a ton and more on recent business. Southern foundries have also announced an increase to \$37 to \$38 per ton, Birmingham. Large buying of gas pipe by privately owned utility companies is expected soon, one of the leading gas companies having entered the market for about 15,000 tons of gas pipe for winter delivery. The New York Power & Light Co. is inquiring for about 3000 tons of gas pipe for use at Syracuse, Utica and other central New York cities. Albany, N. Y., is planning a water project which will require 40,000 to 50,000 tons of cast iron or concrete pipe, and has been obtaining estimates; an inquiry for a section of the project will probably be issued before the end of the year. An export inquiry from the Amoy Water Co., Amoy, China, calls for about 1000 tons of 4, 8 and 12-in. water pipe and a tonnage of fittings, bids being acceptable from British, French or

American makers. About 15,000 tons of water pipe for Warwick, R. I., has been awarded to the low bidder, the Herbert Kennedy Co., representing the Pont-a-Mousson works in France.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Many consumers of by-product foundry coke in this district have contracted for their requirements over the first half of next year. Prices of standard Connellsville coke are unchanged at \$2.85 to \$3.05 per net ton, Connellsville, for furnace grade and \$3.50 to \$3.75 per ton, Connellsville, for foundry. Special brands of foundry coke are unchanged at \$4.85 per net ton, ovens, or \$8.56, delivered to northern New Jersey, Jersey City and Newark, and \$9.44, to New York or Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn. The West Virginia producer of by-product foundry coke expects to open its books soon for first half contracts.

Old Material.—Most grades of iron and steel scrap continue to decline, with brokers obtaining a good supply of material at reductions in their buying prices of 25c. to 50c. a ton. No. 1 heavy melting steel is quoted at \$15 to \$15.50 per ton, delivered eastern Pennsylvania mills, except to Bethlehem, for which \$14.50 per ton is offered. On the basis of a recent sale of blast furnace scrap to a Coatesville, Pa., consumer at \$11 per ton, the buying prices of brokers show a slight advance. Machine shop turnings are quoted at \$11 to \$11.25 per ton, delivered Phoenixville, Pa., and yard grade of heavy melting steel at \$12 to \$12.50 per ton, delivered to Phoenixville and Pottsville, Pa. New contracts by consumers in eastern Pennsylvania are limited in number and are for small tonnages.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.75 to \$12.00
Heavy melting steel (yard)	8.25 to 9.00
No. 1 hvy. breakable cast.	11.25 to 11.75
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars....	8.75 to 9.25
Machine shop turnings....	7.25 to 7.75
Short shoveling turnings..	7.25 to 7.75
Cast borings (blast furn. or steel works).....	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles.....	17.50 to 18.00
Iron car axles.....	25.25 to 26.25

Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought...	12.25 to 12.75
No. 1 yard wrot., long....	11.25 to 11.75
Rails for rolling.....	13.50 to 14.00
Cast iron carwheels.....	12.50
Stove plate (foundry)....	9.50
Malleable cast (railroad)...	10.00 to 10.50
Cast borings (chemical)...	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Detroit Scrap Easier, But Two Items Are Up

DETROIT, Nov. 13.—Despite the fact that long turnings and No. 1 busheling have advanced 50c. per ton, the general tone of the market is not quite so strong as two weeks ago. Pressure for deliveries has been relieved somewhat.

Shipments of pig iron are about at the October level, with first quarter tonnage being bought at \$20 from furnaces serving the district.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast.....	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets....	12.25 to 12.75
Stove plate	11.00 to 12.00
No. 1 busheling.....	10.50 to 11.00
Sheet clippings	8.00 to 8.50
Flashings	10.75 to 11.25

Buys Buffalo Steel Car Co.

General American Tank Car Corporation, 230 South Clark Street, Chicago, has concluded arrangement for purchase of plant and property of the Buffalo Steel Car Co., East Walden Avenue, Buffalo, and will take immediate possession. The Buffalo plant will be continued and expanded and will be used primarily as a repair and maintenance works for tank cars of the purchasing company and similar railroad-owned rolling stock.

Italy's Scrap Imports in 1927 Were 631,684 Tons

WASHINGTON, Nov. 13.—Imports of iron and steel scrap from all sources through Genoa in 1927 totaled 115,941 metric tons, against a total for all ports of Italy of 631,684 tons. All phases of this trade and the factors making for the importance of Genoa in the Italian import trade are discussed in a report by Vice-Consul Julian C. Dorr, Genoa, which the Iron and Steel Division, Department of Commerce, announces may be borrowed for examination by interested American exporters. In addition, there is available a list of importers and consumers of scrap in the Genoa consular district compiled by Consular Clerk Ivan Lavretsky. The list is available to firms on the Exporters' Index of the Bureau of Foreign and Domestic Commerce.

Further Reduction in Trackwork

October shipments of trackwork for T-rail track 60 lb. and heavier, 9493 tons, made the smallest total since January, according to the American Iron and Steel Institute. There has been a steady drop since May, when 14,141 tons was shipped. In September the amount was 10,767 tons; in October, 1927, it was 9914 tons. Only twice in the past three years has a smaller tonnage been shipped than last month.

Pacific Coast

Longview Bridge, Taking 14,000 Tons, Awarded—Plates \$1 a Ton Higher—Oil Country Demand Good

SAN FRANCISCO, Nov. 10 (*By Air Mail*).—Increased interest in the plate market, with more awards and inquiries, and the award of 14,000 tons of structural steel for a bridge over the Columbia River at Longview, Wash., to the Wallace Bridge & Structural Steel Co., were among the important developments in the Pacific Coast iron and steel markets. Plates are \$1 a ton higher.

While building operations in Los Angeles during the past month fell off considerably from the total for October, 1927, Seattle and San Francisco permits showed a substantial increase. In Los Angeles the estimated valuation of permits was \$7,655,526, compared with \$10,388,098 for October a year ago. For the first 10 months of the year, permits aggregated \$85,046,447, against \$98,932,409 for the corresponding period in 1927. October permits at Seattle were the highest on record, as is the total for the first 10 months of the year. Permits in October totaled \$3,113,030, compared with \$1,296,255 in October a year ago. For the first 10 months, the total was \$32,495,705, exceeding the former high mark by \$4,000,000. San Francisco permits totaled \$5,687,396 and Oakland permits, \$1,162,272.

Pig Iron.—The largest inquiry for pig iron before the trade calls for 300 tons of No. 2 foundry iron for the Quartermaster Supply Officer at Fort Mason, San Francisco, bids on which are to be opened Nov. 13. Quotations are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel awards this week were the heaviest in over three months, exceeding 2500 tons. Included among the more important lots were 750 tons each for the second units of the Zellerbach Paper Co. plants at Hoquiam and Port Townsend, Wash., booked by the Pacific Coast Steel Co. The latter company also will furnish 140 tons for a hotel in San Francisco. Bids were rejected on a bridge over the Missouri River

near Wolf Point, Mont., calling for 114 tons. The largest pending inquiry involves 1800 tons for the Life Science Building at Berkeley, Cal. Out-of-stock prices continue weak at about 1.80c., base, both in the Los Angeles and San Francisco districts. Merchant bar steel is firm at 2.35c., c.i.f. Los Angeles and San Francisco. Demand, however, is spotty and both sales and inquiries are confined to unimportant lots.

Plates.—Prices on plates are stronger, and 2.25c. c.i.f. Coast ports now appears to be the minimum, with 2.30c. applying on small lots. The former minimum of 2.20c. was in force for several months. Awards include 3200 tons for 10 80,000-bbl. tanks for the Shell Oil Co. at Dominguez, Cal., booked by Lacy Mfg. Co., 600 tons for boilers for the Great Northern at Seattle and 750 tons for boilers for the Zellerbach Paper Co. at Port Townsend, Wash., placed with the Puget Sound Machinery Depot. The Moore Dry Dock Co. took 200 tons for a ferry boat at San Diego. Bids were opened this week on 231 tons for a 24-in. riveted pipe line at Seattle. The Shell Oil Co., San Francisco, has an inquiry out for 1200 tons for four 82,000-bbl. tanks at Martinez. The Llewellyn Iron Works is low bidder on 370 tons for a 40-in. welded pipe line for Los Angeles.

Shapes.—The outstanding structural award of the year has been placed with the Wallace Bridge & Structural Steel Co. and calls for 14,000 tons for the Longview bridge, Longview, Wash. The Judson-Pacific Co. booked 450 tons for a department store for Magnin's in San Francisco. About 580 tons for transmission towers for the Southern California Edison Co. and the San Joaquin Light & Power Co. has been placed with the Pacific Coast Steel Co. No new inquiries of importance have developed. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe is slow. Awards placed during the week called for lots of less than 100 tons. Watson & Sutton were low bidders on 106 tons of 4 to 10-in. Class B pipe for the improvement of Turquoise Street, San Diego, Cal. Bids have been opened on 1284 tons of 24-in. Class B pipe for Seattle, alternate bids having been taken on riveted steel pipe. The only new inquiry of importance calls for 111 tons of 12-in. Class B pipe for Aberdeen, Wash., bids on which are to be opened Nov. 14.

Steel Pipe.—Movement of oil country goods, especially in southern California, continues unabated. Demand for standard steel pipe has shown signs of improvement, stocks in distributors' hands having become depleted in some sizes. The Puget Sound Machinery Depot, Seattle, has placed an order for 300 tons of boiler tubes for 10 locomotives for the Great Northern. Los Angeles will open bids on Nov. 15 for 102 tons of $\frac{3}{4}$ and 1-in. galvanized pipe.

St. Louis

Heavy Pig Iron Sales Establish Record Volume for Two Weeks—Steel Demand Fairly Steady

ST. LOUIS, Nov. 13.—The sale of 46,000 tons of pig iron, combined with previous week's total of 45,000 tons, brought the sales of the St. Louis Gas & Coke Corporation for the two weeks up to the record volume of 91,000 tons. This included 32,000 tons of basic last week and 33,000 tons the preceding week, a total of 65,000 tons of basic for the two weeks, another record. Of the past week's basic sales, 15,000 tons to a St. Louis melter, 10,000 tons to one East Side consumer and 5000 to another were for first quarter shipment, and 2000 tons to a West Side melter was for delivery during the remainder of this year. The basic iron is largely for melters catering to needs of the railroads. Of the past week's sales of 12,500 tons of foundry iron, all for first quarter, 7800 went to radiator manufacturers in lots of 3500 tons, 3100 tons and 1200 tons, respectively, 1000 tons to stove manufacturers, who are enjoying a good re-order business, and 2350 tons to various implement manufacturers. Malleable orders for the week totaled

2000 tons. Shipments of the Granite City maker for November promise to equal those of October, which were the heaviest in the history of the company, although one of its two furnaces has been down for several

Northern basic, deliv'd	 22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Colder weather has brought heavier shipments of by-product domestic coke to dealers outside the city. In St. Louis, the hand-to-mouth buying of dealers continues, but with an increasing movement. The larger melt has substantially increased the takings against contracts for foundry grades.

Finished Iron and Steel.—While there has been a falling off in new sheet business, due to consumers and jobbers taking a breathing spell after unusually heavy specifications, the backlog of orders of the Granite City Steel Co. is sufficiently large to continue the operation of all sheet units at capacity. From the reports the Granite City company has received, it is apparent that distributors and fabricators of sheets have not increased their stocks, although they have bought heavily during the last 60 days, indicating that they have been turning over their raw materials as fast as they have received them. Plates continue to lag, although there seems to be sufficient business to hold prices steady. Sheet prices are firmer than they have been in months, and higher levels are expected in the near future. Warehouse business for November thus far is about on a level with this time last year. Structural steel business is quiet, although fabricators are reported to be in fairly

good condition, largely through the number of small orders.

Old Material.—Dealers are declining old material business at prices consumers have expressed their willingness to pay, which are prices prevailing on preceding purchases. The market is strong, and dealers feel that consumers' stocks are so low as to force them into the market. The only price changes this week are advances of 50c. a ton on iron rails, steel car axles, steel rails less than 3 ft. and No. 1 machinery cast, and 25c. on cast iron carwheels. Railroad lists include: Louisville & Nashville, 11,690 tons; Atchison, Topeka & Santa Fe, 6075 tons; Chesapeake & Ohio, 5027 tons; Wabash, 3800 tons; Texas & Pacific, 3174 tons; Missouri-Kansas-Texas, 1700 tons; Ann Arbor, 377 tons; Manistique & Lake Superior, 105 tons; Chicago, Rock Island & Pacific, 55 carloads; Chicago & Eastern Illinois, 17 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	\$13.25 to \$13.75
No. 2 heavy melting or shoveling steel	 12.25 to 12.75
No. 1 locomotive tires	 14.50 to 15.00
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	 14.75 to 15.25
Railroad springs	 15.75 to 16.25
Bundled sheets	 9.50 to 10.00
No. 2 railroad wrought	 13.25 to 13.75
No. 1 busheling	 9.50 to 9.75
Cast iron borings	 8.75 to 9.25
Iron rails	 13.50 to 14.00
Rails for rolling	 15.25 to 15.75
Machine shop turnings	 9.00 to 9.50
Steel car axles	 19.00 to 19.50
Iron car axles	 27.00 to 27.50
Wrot. iron bars and trans.	 22.00 to 22.50

Relay. rails, 60 lb. and under	 20.50 to 23.50
Relay. rails, 70 lb. and over	 26.50 to 29.00

ness comes up for negotiation. Full establishment of sheet bars at \$34, would be helpful to the proposed advance in sheets, according to one view, but another is that unless sheets can be advanced it will be very difficult, if not impossible, to obtain an advance on sheet bars.

In a general way, the steel industry in this area is feeling the contraction in demand incident to the approach of the end of the year and the effort of consumers to cut, rather than add to, inventories. Plant engagement reflects that development. As against practically full occupation of steel works and rolling mills a month ago, the independent company average of ingot production is as low as 80 per cent in some cases and there has been a corresponding recession in rolling mill operations, notably in bar mill activities. The automotive parts makers have become very sparing buyers of cold-finished steel bars lately, and that is felt by the hot-rolled bar makers who supply cold-finished bar producers. Nothing has come out as to first quarter bar prices; currently, the market is quotable at 1.95c. to 2c., base, but a considerable tonnage contracted for at 1.90c., base, for this quarter remains to be specified. The fear is expressed that the mills may need orders a little more urgently than buyers need supplies and this may prevent any advance over the present quarter's price.

Orders for strips appear to be very little less in the aggregate than they were a month ago and makers, not being in need of fresh business to sustain economical mill operations, have firm ideas as to prices. On cold-rolled strips, 2.85c., base Pittsburgh, is the ruling price on new business, while quotations on hot-rolled are made on current business for early delivery with an eye to helping the full establishment on first quarter tonnages of the recently adopted base prices and the new card of extras.

Pipe business is good in line pipe and fairly satisfactory in other classes. The common expectation among pipe makers is that much line pipe will come out this winter and that next spring will bring a very decided increase in the demand for oil well pipe, on account of the improvement in the oil market, both as to its statistical and price positions.

Although steel works operations are down from where they were a month ago, it is said there has been no relaxation in the insistence of the steel makers for deliveries of scrap. It is observed, however, that while dealers report the consumer prices of heavy melting steel at from \$18 to \$18.50, they are not bidding more than \$17.50, and the difference suggests that the recent pinch in supplies has been pretty well corrected. It develops that the sharp upswing in local scrap prices was due to the fact that local melters figured on getting some supplies of Detroit scrap as the end of the Lake shipping season approached and delayed purchases. In the mean-

Youngstown

Mills Want More for Sheets and Sheet Bars—Operations at About 80 Per Cent

YOUNGSTOWN, Nov. 13.—Advances of \$2 a ton on sheets and \$1 a ton on sheet bars are the important developments of the week. Both advances are effective immediately and put sheet bars to \$34 at Youngstown or Pittsburgh and sheets at 2.85c., base Pittsburgh, for black, 3.60c. base, for galvanized, 2.10c., base, for blue annealed and 4.10c., base, for automobile body sheets. While not so stated, the new prices are likely to find greater application on first quarter business than on tonnage for shipment over the remainder of this year, since non-integrated sheet makers are covered against their requirements for this quarter and that also is the position of sheet buyers, or at least a majority of them. Local mills still are quoting 4 x 4-in., but under 10 x 10-in., billets and the equivalent area in slabs at \$33, Youngstown or Pitts-

burgh, which means that forms less than 4 x 4-in. down to and including 1½ in. x 1½ in. command \$34, while a card announced by manufacturers last August also provides extras on sizes 10 x 10 in. and larger.

For the third and fourth quarters, there has been a single price of \$33 for the base sizes of billets and slabs and for sheet bars. Previously, sheet bars commanded a premium of \$1 a ton on 4 x 4-in. and over to, but not including, 10 x 10-in. billets and slabs, and the latest price revision merely re-establishes that relationship. A Cleveland producer, however, has announced \$34, base Cleveland, for billets and slabs and sheet bars. Whether the general market will settle to a single price for these forms or to one price for sheet bars and a lower one for billets and slabs will be determined when first quarter busi-

time, strength at Pittsburgh and other markets made it hard for Youngstown dealers to get supplies and, with consumption heavy, a pinch was the result. Recent sales of railroad heavy melting steel at over \$19, delivered this district, find explanation in the necessity of consumers for speedy deliveries. Compressed sheets have sold into consumption at \$18 to \$18.50, but dealers now are trying to buy them at \$17. Dealers are bidding \$11 to

\$11.50 for machine shop turnings. Producers of pig iron are asking higher prices than melters are prepared to pay, and actual business does not reach very large proportions. On basic and No. 2 foundry, \$18, furnace, is asked, on malleable \$18.50 and on Bessemer \$19. The Struthers Furnace Co. has begun to receive ore shipments and expects to have the relining and repairs of the furnace completed in time to blow in by Dec. 10.

ment of Public Works; 150 tons to Frankel Brothers, Eastern Avenue, for Toronto Bible College, Spadina Avenue, Toronto; 250 tons to the Hamilton Bridge Co., Hamilton, Ont., for factory at New Toronto, Ont., for Ritchie Cut Stone Co.

Old Material.—General market conditions show little or no change. Prices are firm. The demand for most lines of scrap is brisk in the Toronto and Montreal markets. Consumers are showing interest in heavy melting steel and machinery cast, and the bulk of orders taken by local dealers during the week were for these grades. Montreal buyers are favoring wrought iron and steel axles as well as heavy melting steel and turnings. The export demand in the Montreal district is still a feature and dealers there report a good outlet in the United States for surplus holdings.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel....	\$9.50	\$7.00
Rails, scrap	10.00	9.00

Canada

Railroads Place Large Orders for Rolling Stock—Structural Steel Demand Also Features Dominion Business

TORONTO, ONT., Nov. 13.—Extensive rolling stock purchases by Canadian railroads were outstanding in the business of the week. Orders from the Canadian National totaled approximately \$14,000,000, while the Canadian Pacific placed about \$10,000,000 worth of business. Canadian car and locomotive building concerns now have large orders on their books. Steel mills are also receiving some new business. Rail orders have not yet been placed, but a large volume of new tonnage of a diversified character has been forthcoming and other large orders are in prospect.

Pig Iron.—Weekly sales continue in good volume. Current demand is confined to immediate needs of consumers. The majority of hand-to-mouth buyers have limited supplies and are coming into the market at frequent intervals. Releases against contracts are responsible for a large movement of foundry and malleable iron. Of the seven active blast furnaces, three are making foundry and malleable iron. While both active stacks of the Dominion Iron & Steel Co., Sydney, N. S., are now running on basic, the company has enough foundry iron piled to take care of all present needs. The Steel Co. of Canada, Ltd., the Algoma Steel Corporation and the Canadian Furnace Co. also have large stocks of foundry and malleable iron. Producers who have continued to sell at the former level of \$23.10 have now advanced their prices 50c. per ton in the Toronto market, with the result that all Canadian producers are quoting No. 1 foundry iron at \$23.60, Toronto, and \$25, Montreal.

Prices per gross ton:

Delivered Toronto

Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Fabricators of structural steel continue to close large tonnages each week, and in many instances plants are greatly exceeding their former estimated peak produc-

tion. In connection with the proposed \$6,000,000 extension program of the Steel Co. of Canada, Ltd., Hamilton, Ont., about 5000 tons of steel is pending; for an office building in Toronto for the Canadian Bank of Commerce, approximately 8000 tons will be required. Other business in prospect includes 2000 tons for factory building on Girouard Street, St. Hyacinthe, Que., for Penmans, Ltd.; 2500 tons for building on University Avenue, Toronto, for the Bell Telephone Co. of Canada. Contracts awarded during the week include one for 2500 tons to the Dominion Bridge Co., Lachine, Que., for building on Wellington Street, Ottawa, for Dominion Depart-

Boston

Pig Iron Prices Stronger—Cast Iron Pipe Higher—Scrap Goes to Lower Levels

BOSTON, Nov. 13.—Pig iron sales in this territory the past week totaled 8000 tons, mostly Mystic and Buffalo iron. Buffalo No. 2 plain is now generally \$18 a ton, furnace, No. 2X \$18.50, and No. 1X \$19.50, although some business the past week was put through on a \$17.50, furnace, base. The Mystic Iron Works has taken business at \$20 a ton, furnace, base, which is 50c. to \$1 a ton up. New York State and Virginia irons are firmly held at regular price schedules. No open inquiries of importance are noted. Indian iron is well sold up for this year's delivery, and prices are largely nominal at \$21.50 to \$22 a ton on dock here, duty paid, for No. 2X. These prices are 25c. to 50c. a ton higher than those of a month ago.

Foundry iron prices per gross ton deliv'd to most New England points:

*Including quantity differentials.

10 months ended with October were 9520 tons, contrasted with 22,199 tons for the like period last year, 54,253 tons for the like period of 1926, and 79,719 tons for the like period of 1925. While there has been a marked shrinkage of importations this year, receipts of Indian iron have held up much better than those from Holland and other countries. October ore importations were 8950 tons, against 10,030 tons in September, and 23,447 tons in October last year. Importations for the 10 months ended with October were 99,266 tons, against 185,585 tons last year. The disparity between this and last year's figures is largely accounted for by the fact that the Mystic Iron Works is using larger quantities of domestic ores.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. report a strong demand for by-product foundry coke. Specifications against last half contracts are largely for current foundry needs, not more than four or five of the largest melters having covered their winter requirements. Foundry coke remains at \$11 a ton, delivered within a \$3.10 freight rate zone.

Cast Iron Pipe.—Despite the fact that pipe makers located north of Alabama are meeting stiff competition from Alabama and foreign foundries for New England business, they have marked up prices \$2 a ton on the average. Their position is based on a sold-up condition on small and medium dimension pipe and on the rising cost of pig iron. The local market on pipe made north of Alabama is now 4-in., \$48.10 a ton, delivered common Boston freight rate points; 6 to 16-in., \$43.10. The usual \$5 a ton differential is asked on Class A and gas pipe. Concessions of \$1 a ton or more, depending on the tonnage in-

volved, can be obtained on larger than 16-in. pipe. The National Cast Iron Pipe Co. was low bidder on 100 tons of 6-in. pipe for Salem, Mass. No award has been made. Foreign pipe interests were approximately \$100,000 under some domestic pipe makers on bids recently opened by Warwick, R. I., for 14,000 tons. That town is in the market for a \$400,000 loan for its water works project.

Old Material.—Scrap prices are weaker. New business has dropped to small proportions, but there is a fair amount of activity on old contracts. No. 1 heavy melting steel is \$1 a ton below its price of a week ago, and steel turnings are down as much, while scrap rails, railroad wrought and forged scrap are 50c. a ton lower, and most other kinds of material are off about 25c. The export market is still inactive owing to inability of shippers to secure vessel space. New England foundries are curtailing purchases of textile and machinery cast.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$10.50 to \$11.00
Scrap T rails.	10.50 to 11.00
Scrap girder rails.	10.00 to 10.50
No. 1 railroad wrought.	11.00 to 11.50
No. 1 yard wrought.	9.00 to 9.50
Machine shop turnings.	6.00 to 6.50
Cast iron borings (steel works and rolling mill).	6.00 to 6.50
Bundled skeleton, long.	9.00 to 9.25
Forge flashings	9.50 to 9.75
Blast furnace borings and turnings	6.00 to 6.50
Forge scrap	6.50 to 7.00
Shafting	14.50 to 14.75
Steel car axles.	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	10.00 to 10.25
Rails for rolling.	11.00 to 11.50
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$14.00 to \$14.50
No. 1 machinery cast.	15.00 to 15.50
No. 2 machinery cast.	13.00 to 13.50
Stove plate	11.00 to 11.50
Railroad malleable	15.50 to 15.75

Buffalo maker will furnish 100 tons for a Y. M. C. A. building at Jamestown, N. Y., and an inquiry is out for 100 tons for a school at Lackawanna, N. Y. Warehouse business is exceptionally good. Wire mills report a seasonal slackening. Business in their other lines is keeping up.

Old Material.—Little new selling has been done during the past week, but the mills continue heavy operations and a great deal of scrap is being consumed. One of the larger plants continues to restrict shipments, but this regulation is not quite as stringent as it was. Consumption of scrap generally is the heaviest in years. Some lots of borings and turnings have been sold at \$11 to \$11.50 and some machine shop turnings have been sold at \$7.50 to \$8. There have been occasional car lot sales of low phosphorus, knuckles and couplers and short rails at the quoted prices. Outside districts are taking considerable tonnage of heavy melting steel and hydraulic compressed sheets from this district.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$15.75 to \$17.00
No. 2 heavy melting steel.	14.25
Scrap rails	15.50 to 16.00

Railroad	16.00 to 16.50
Agricultural	16.00 to 16.50

Buffalo

Furnaces Again Advance Pig Iron for Outside Shipment—Steel Mills Maintain Large Production

BUFFALO, Nov. 13.—Buffalo furnaces have again advanced prices on malleable and foundry grades. The district base of \$18.50 remains, but for outside shipment quotations have been moved up to \$18 for No. 2 foundry, 1.75 to 2.25 per cent silicon, and to \$18.50 for malleable up to 2.25 per cent. While this new Eastern base has been shaded 50c., in the main it has held, and considerable iron has been sold at \$18, Buffalo, for Eastern

delivery. Pig iron makers say that first quarter iron is yet to be purchased. Salesmen bring word to home offices of a sustained heavy melt throughout the State. Full differentials are being obtained on the quoted bases. There are few sizable inquiries. The Donner Steel Co. has put out its No. 1 furnace, which has been making foundry iron. It will be down for repairs until Jan. 1.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.	\$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75	18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25	19.50 to 20.00
Malleable sil. up to 2.25.	18.50 to 19.00
Basic	17.50 to 18.00
Lake Superior charcoal.	27.28

Finished Iron and Steel.—Operation is being maintained by Buffalo mills at the same high rate, and specifications are liberal. Bar and shape inquiry is sustained and sheets are moving well. Reinforcing bar business shows a seasonal tapering. A

"Chromium Plating and General Research" was the subject of a paper read by Dr. William Blum, assistant director of the United States Bureau of Standards, Washington, before the November meeting of the Detroit branch of the American Electroplaters Society at Hotel Statler, Detroit, Nov. 2. More than 1000 members of the society are expected to attend the seventeenth annual convention which will be held at Hotel Statler, Detroit, July 8 to 11, 1929.

Birmingham

First Quarter Pig Iron Inquiries Appear—Furnaces May Advance Prices—Cast Iron Pipe \$1 Higher

BIRMINGHAM, Nov. 13.—Several good inquiries have been received in the last few days on first quarter pig iron, but makers have not opened books for that period. The base price of \$16.25 for No. 2 foundry is being maintained. Considerable more firmness is noted, and it is generally expected that prices will be advanced when books are opened for the next quarter. Some iron is being sold from day to day, but the liberal bookings for the present quarter keep the total volume of new sales low. Shipments last week were hardly up to the weekly average for October, and were a little below production. There have been no changes in furnace operations during the past two weeks. Of the 18 furnaces in blast, 13 are on foundry, four on basic and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Rail buying has improved during the past week and the accumulated tonnage of the Tennessee company will probably warrant the reopening of the Ensley rail mill within the next few days. Buying in other lines continues favorable. There is a larger unfilled tonnage in the more important lines than at any other time in the past several seasons. The market has a firm tone at the prices that have prevailed for the past several weeks. Bookings by fabricated structural steel plants have been light during the past week, but the pending tonnage is the largest for the year. Plant operations are unchanged; the Tennessee company is operating seven open-hearths at Fairfield and five at Ensley, and the Gulf States Steel Co. continues to work four at Alabama City.

Cast Iron Pipe.—Pressure pipe plants are now quoting \$37 to \$38 on 6-in. and larger sizes, an advance of \$1 a ton. The market continues dull. Unless there is an improvement in new business the plants will about complete forward bookings by the early part of December. Only occasional inquiries are developing. The Central Foundry Co. has an order for 1490 tons for Dallas, Tex.; the United States Cast Iron Pipe & Foundry Co., 1300 tons for San Francisco, and the American Cast Iron Pipe Co., 850 tons for Los Angeles.

Coke.—Foundry coke is doing little better than holding its own. Increased demand is noted for domestic sizes, especially from the North and Middle West. Shipments are being maintained at a fairly good rate. Some coke has been shipped for the Pacific Coast by way of Mobile. Prices continue steady at \$5 for both spot and foundry.

Old Material.—The past week made the third week that shipments have been light. Consumers are confining orders to immediate needs, but inquiries have improved in the last two or three days and dealers are expecting better conditions beginning with this week. There has been no change in prices for some time.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50

Cincinnati

Pig Iron Buying Light, but Prices Show Strength

CINCINNATI, Nov. 13.—Pig iron sales the past week totaled less than 5000 tons. Aside from 2300 tons of foundry for an Ohio melter and 500 tons for another consumer, orders were for small miscellaneous lots. Inquiries are scarce; most of the current business is being closed quietly. Prices are showing strength, with northern Ohio foundry at \$18.50, base furnace, and Southern iron at \$16.25, base Birmingham. Southern Ohio foundry iron is quoted nominally at \$18.50, base Ironton.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25.....	\$20.39
Ala. fdy., sil. 1.75 to 2.25.....	19.94
Ala. fdy., sil. 2.25 to 2.75.....	20.44
Tenn. fdy., sil. 1.75 to 2.25.....	19.94
S'th'n Ohio silvery 8 per cent.....	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Specifications and orders for bars, structural shapes and plates have fallen off slightly in the past week, although bookings this

4-in.	39.00

month have reached fairly good proportions. Fabricators are moderately busy on numerous small projects, but the number of large jobs is meager. Agricultural implement makers continue to take liberal tonnages of bars to meet production requirements for next spring. Prices of heavy steel products are firm at 1.90c. to 2c., base Pittsburgh, and the schedule for first quarter is likely to name 2c. as the minimum. Interest in the sheet steel market centers in prices for next year. Companies in this district are considering the advisability of raising quotations at least \$2 a ton, the advance in primary materials having made necessary some action in revising schedules upward. Meanwhile, quotations are steady and unchanged. Sheet mill operations have not varied from the recent rate of 100 per cent of capacity, and this production program may carry through the remainder of the month. Backlogs are fairly satisfactory and a good volume of business from diversified sources has been placed in the past week. The demand for wire goods is rather dull. Common wire nails are quoted at \$2.69 per keg, delivered Cincinnati, or \$2.55, Ironton.

Coke.—Shipments of by-product foundry coke have declined somewhat from the high level maintained during October, but have been in fairly good volume. Sales of domestic grades have taken a seasonal upward turn. Movement of beehive foundry coke from the New River and Wise County districts has been moderate. Prices are firm.

Old Material.—Prices are firm in the face of a more conservative buying policy on the part of dealers. Steel plants are operating at full capacity and are accepting substantial tonnages on current contracts, but are not buying for forward delivery.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.25 to \$13.75

Youngstown Sheet & Tube Co. Advances Sheet Prices

YOUNGSTOWN, Nov. 12. — The Youngstown Sheet & Tube Co. today announced a new price schedule on steel sheets, as follows: Blue annealed, 2.10c. per lb.; black, 2.85c.; galvanized, 3.60c., and full finished, 4.10c. Chicago prices are 10c. per 100 lb. higher. The new list represents an advance of \$2 per ton, and will apply on first quarter shipments. Other independents will also advance prices.

Non-Ferrous Metal Markets

Copper Quiet and Firm, Tin Moderately Active and Steady, Lead Declines, Zinc Unchanged

NEW YORK, Nov. 13.

Copper.—October statistics, made public today, reveal the prosperity and the strong position of the copper market. The feature was the record breaking domestic shipments of over 100,300 tons, an increase of 13 per cent over those of September. Total foreign and domestic shipments exceeded 155,300 tons, breaking the previous record in August this year by more than 11,000 tons, or 8 per cent. There was also a decrease in refined stocks of more than 6100 tons, the blister stocks increasing 1800 tons, leaving a net decrease of copper above ground of about 4300 tons. Mine production increased 8700 tons over that of September and the re-

*Refinery quotation; delivered price ¼c. higher.

finery output about 250 tons a day. Just what effect these statistics will have on the market is conjectural. If buyers realize that the increased production will provide for their needs, excessive purchasing, followed by a possible increase in prices, is not likely to result. The market in the last week has been quiet and very firm, with electrolytic copper quoted at 16c., delivered in the Connecticut Valley, and 16.25c., c.i.f. European ports. Moderate sales have been made to domestic consumers for delivery through January and February, and to foreign consumers through December and January. Lake copper is very quiet but firm at 16.12½c., delivered.

Tin.—Sales for the week ended Nov. 10 were about 1000 tons, mostly spot, November and December delivery. Business was about equally divided between consumers and dealers, with interest centered chiefly in

this year's metal. In general, the trade is afraid of the market because of manipulations in London and various unsubstantiated rumors affecting prices. The situation is so confusing that dealers are doing little and consumers are afraid to commit themselves. One responsible opinion is that if the market were left to itself prices would be lower. Spot Straits tin today was quoted at 50.12½c., New York, with about 300 tons sold in a moderately active market. London prices were higher than a week ago with spot standard quoted at £230, future standard at £225, and spot Straits at £230 5s. The Singapore price today was £237. Arrivals thus far this month have been 670 tons, with 6615 tons reported afloat.

Lead.—Late Friday, Nov. 9, the American Smelting & Refining Co. reduced its contract price from 6.50c. to 6.35c., New York. This was

Non-Ferrous Rolled Products

Mill prices on brass and copper products are still quoted at the advances of Oct. 29. Zinc sheets have been steady at 9.75c. per lb., base, since July 30, and lead full sheets at 10c. to 10.25c. since May 29.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	20.50c.
Copper, hot rolled.....	25.00c.
Zinc	9.75c.
Lead (full sheets).....	10.00c. to 10.25c.
Seamless Tubes—	
High brass	25.37½c.
Copper	26.37½c.

Rods—	
High brass	18.25c.
Naval brass	20.25c.

Wire—	
Copper	17.87½c.
High brass	21.00c.
Copper in Rolls	24.00c.
Brazed Brass Tubing.....	28.50c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.	
Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible.....	13.75c.	15.00c.
Copper, hvy. and wire	13.50c.	14.50c.
Copper, light and bottoms	11.50c.	12.75c.
Brass, heavy	7.75c.	9.00c.
Brass, light	6.50c.	7.50c.
Hvy. machine composition	10.25c.	11.25c.
No. 1 yel. brass turnings	9.25c.	9.875c.
No. 1 red brass or compos. turnings..	9.50c.	10.50c.
Lead, heavy	5.25c.	5.625c.
Lead, tea	3.75c.	4.25c.
Zinc	3.25c.	3.625c.
Sheet aluminum	13.00c.	15.00c.
Cast aluminum	11.75c.	13.50c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)	
Sheets—	Base per Lb.
High brass	20.50c.
Copper, hot rolled.....	25.00c.
Copper, cold rolled, 14 oz. and heavier	27.25c.
Zinc	10.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	26.87½c.
Copper	27.87½c.
Brass Rods	18.25c.
Brazed Brass Tubes.....	28.50c.

caused largely by lower prices in London and the possibility of imports of Mexican lead. The market here has been moderately active, particularly today, with sales at 6.35c., New York, or 6.20c., St. Louis. Sales embrace November and some December delivery with the buying fairly broad.

Zinc.—Statistics for October were quite favorable in that they showed a decrease in refined stocks of about 1800 tons and a large reduction in the number of active retorts at the end of the month, the total being the lowest for any month since 1920. Deliveries into consumption were over 52,100 tons, which were the third largest for any month this year and well above the average of 48,200 tons. The ore situation was also improved, statistics for last week showing production somewhat smaller, with the price unchanged at \$40, Joplin. Prices for prime Western for delivery through January are 6.25c., East St. Louis, or 6.60c., New York, with buying the past week in moderate volume.

Antimony.—Fairly active buying has featured the market the last few

days, but prices are a little lower at 10.37½c. for spot and 10.25c. for futures, duty paid, New York.

Nickel.—Ingot nickel in wholesale lots is unchanged at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Markets at Chicago

CHICAGO, Nov. 13.—Prices for tin are higher and quotations on lead are lower than a week ago. Spot sales are moderately active. The old metal market is active in small sales and prices are steady.

Prices, per lb., in carload lots: Lake copper, 16.75c.; tin, 50.50c.; lead, 6.30c., zinc, 6.35c.; in less-than-carload lots; antimony, 11c. On old metals, we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

boilers for Great Northern, to Puget Sound Machinery Depot.

SEATTLE, 14,000 tons, Longview bridge over Columbia River, to Wallace Bridge & Structural Steel Co.

PORT TOWNSEND, WASH., 750 tons plates, 15 boilers for Zellerbach Paper Co., to Puget Sound Machinery Depot.

SAN DIEGO, CAL., 200 tons plates, ferry boat to Moore Dry Dock Co.

EXCHEQUER, CAL., 150 tons, transmission towers for San Joaquin Light & Power Co., to Pacific Coast Steel Co.

SAN FRANCISCO, 450 tons, Magnin's department store, to Judson-Pacific Co.

SAN FRANCISCO, 200 tons, apartment building, Jackson and Baker Streets, to Golden Gate Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PROVIDENCE, 340 tons, Providence Institute of Savings bank.

BOSTON, 250 tons, New York, New Haven & Hartford Railroad freight shed.

NEW YORK, 1000 tons, apartment building at 623 Park Avenue; Starrett Brothers, general contractor.

NEW YORK, 3670 tons, section of subway; bids Nov. 13.

BUFFALO, 500 tons, building for New York Central Railroad.

JERSEY CITY, 1600 tons, column cores for Delaware, Lackawanna & Western terminal; Levering & Garrigues Co., low bidder.

PHILADELPHIA 700 tons, junior high school at Upper Darby.

PHILADELPHIA, 1000 tons, city hospital, Kober Construction Co., Philadelphia, low bidder on general contract.

PHILADELPHIA 2200 tons, plant for United States Gypsum Co., general contract to Morton G. Tuttle, Boston.

AKRON, OHIO, 6500 tons, hangar for Goodyear Zeppelin Co.

MILWAUKEE, 1200 tons, tractor plant for Allis-Chalmers Mfg. Co.

SOUTH CHICAGO, 500 tons, building for International Harvester Co.

CHICAGO, 1000 tons, naval armory; Zackery Davis, architect.

HELENA, MONT., 667 tons, bridge over Missouri River near Wolf Point; bids rejected.

LOS ANGELES, 370 tons plates, 40-in. pipe for city; Llewellyn Iron Works, low bidder.

SAN FRANCISCO, 1200 tons plates, four 82,000-bbl. tanks for Shell Oil Co.; bids being taken.

Fabricated Structural Steel

New York Office Building Takes 15,600 Tons and Seattle Bridge 14,000 Tons of 54,800 Tons Awarded

WITH an office building at New York requiring 15,600 tons and a bridge over the Columbia River near Seattle, Wash., 14,000 tons, awards reported during the last week totaled about 54,800 tons. New projects, amounting to 18,800 tons, included a hangar at Akron, Ohio, which will take 6500 tons. Awards follow:

NEW YORK, 15,600 tons, Chrysler Building at Lexington Avenue and Forty-second Street, to American Bridge Co.

NEW YORK, 1200 tons, office building at Thirteenth Street and Verona Avenue, Long Island City, apartment building at 75 Central Park West and amusement building at Archer Avenue and 143rd Street, Jamaica, to George A. Just Co.

PHILADELPHIA, 850 tons, Psychopathic Hospital, to Belmont Iron Works.

BUFFALO, 2000 tons, manufacturing building for Curtiss Aeroplane & Motor Co., to Lackawanna Steel Construction Co.

WAYNESBORO, VA., 500 tons, power plant for Du Pont Engineering Co., to Virginia Bridge & Iron Co.

RICHMOND, VA., 600 tons, power plant for DuPont company, to McClintic-Marshall Co.

CHARLOTTE, N. C., 145 tons, Alexander Graham School, to Carolina Bridge & Iron Co.

CHARLOTTE, 120 tons, Cutter store, to Carolina Bridge & Iron Co.

LOUISVILLE & NASHVILLE RAILROAD, 1300 tons, bridge work, to American Bridge Co.

STATE OF TENNESSEE, 1800 tons, highway bridges; 1100 tons to American Bridge Co., and 700 tons to Nashville Bridge Co.

HARMONY, PA., 7000 tons, Aston iron plant for A. M. Byers Co., to Fort Pitt Bridge Works.

TOLEDO, OHIO, 200 tons, building for Industrial Steel Casting Co., to Donovan Iron & Wire Co.

CLEVELAND, 500 tons, building for St.

Luke's Hospital, to T. H. Brooks & Co. MANSFIELD, OHIO, 725 tons, building for Mansfield Tire & Rubber Co., to Berger Iron Works.

STATE OF OHIO, 175 tons, highway bridge at Dead Man's Crossing, Montgomery County, to Massillon Bridge & Structural Co.

STATE OF INDIANA, 100 tons, bridge No. 2 in Portage County, to Massillon Bridge & Structural Co.

CANTON, ILL., 150 tons, manufacturing building for International Harvester Co., to Massillon Bridge & Structural Co.

CHICAGO, 700 tons, mill building for Acme Steel Co., to McClintic-Marshall Co.

EVANSTON, ILL., 100 tons, addition to Oakton School, to Midland Structural Steel Co., Chicago.

EVANSTON, 425 tons, Young Men's Christian Association building, to Midland Structural Steel Co.

AURORA, ILL., 168 tons, store and loft building, to Midland Structural Steel Co.

FOREST PARK, ILL., 143 tons, building for Borden's Farm Products Co., to Midland Structural Steel Co.

DES PLAINES, ILL., 100 tons, First Congregational Church, to Midland Structural Steel Co.

ELMHURST, ILL., 180 tons, high school, to Midland Structural Steel Co.

LOS ANGELES, 430 tons, transmission towers for Southern California Edison Co., to Pacific Coast Steel Co.

LOS ANGELES, 3200 tons plates, 10 80,000-bbl. tanks for Shell Oil Co., to Lacy Mfg. Co.

SEATTLE, 600 tons plates, 10 locomotive

Purdue Conference on Welding, Dec. 12 to 14

Purdue University's fourth annual conference on welding will be held at Lafayette, Ind., Dec. 12-14, under the direction of the engineering extension department and the department of practical mechanics, with the school of chemical engineering and the manufacturers of welding equipment cooperating. The conference will be devoted to the applications of electric, oxy-acetylene and thermit welding to manufacturing and repair operations, and provisions will be made for exhibits and demonstrations. Programs will be ready for distribution about Dec. 1, and may be obtained from the engineering extension department, Purdue University, Lafayette, Ind. W. A. Knapp is the professor in charge.

PERSONAL

S. P. KINNEY, metallurgist of the Bureau of Mines, has resigned to become associated with H. A. Brassert & Co., consulting engineers, Chicago. He was graduated in chemical engineering from the University of Utah in 1915, and the following year was engaged in the operation of mining

S. P. KINNEY

properties in Utah and Nevada. In 1917 he entered the army and was assigned to the Chemical Warfare Division and later commissioned second lieutenant. He worked in the laboratories of the War Department throughout the war and in 1919 became associated with the Bureau of Mines. He has been a leading participant in the investigations of the Bureau with regard to the iron blast furnace. In 1926 Mr. Kinney received the J. E. Johnson, Jr., Award for blast furnace research from the American Institute of Mining and Metallurgical Engineers.

R. J. HEISSERMAN, manager engineering and sales for the foundry equipment department, Link-Belt Co., Philadelphia, will address the monthly meeting of the Pittsburgh Foundrymen's Association at the Fort Pitt Hotel, Pittsburgh, Monday evening, Nov. 19. His subject will be "Modern Conveyor Methods in the Foundry."

DR. W. H. HATFIELD, director of the Brown-Firth Research Laboratories, Sheffield, England, was a guest of the Boston chapter of the American Society for Steel Treating at the Massachusetts Institute of Technology on Nov. 9. He gave an address on cast iron, placing special stress on recent developments of rust and acid resisting metals.

WALTER J. KOHLER, president Kohler Co., Kohler, Wis., manufacturer of bathtubs, farm lighting plants, etc., was elected governor of Wisconsin on Nov. 6 by plurality of approximately 150,000.

FREDERICK S. BLACKALL, JR., has been appointed general manager of the Taft-Peirce Mfg. Co., Woonsocket, R. I., succeeding his father, the late FREDERICK S. BLACKALL. The younger Mr. Blackall is also assistant secretary and a director of the company. He is a graduate of Yale University and the Massachusetts Institute of Technology and has been active in the management of the company's affairs for the past six years. He is a member of the American Gage Design Committee and of the American Society for Steel Treating.

FRANK M. SMITH, formerly superintendent constructor of aircraft for the United States Navy, is second vice-president and general factory manager for the Moth Aircraft Corporation, Graybar Building, New York, which is soon to begin the manufacture of de Havilland Gypsy Moth airplanes in its plant at Lowell, Mass. J. E. Morrow, formerly vice-president in charge of production for the Willis-Morrow Co., Elmira, N. Y., manufacturer of airplane motors, is production manager for the Moth company. Minton M. Warren, for many years associated with Curtis & Sanger, Boston and New York, is president of the company, and Earl L. House, who introduced the Moth plant to America, is vice-president.

LEONARD J. BUCK has established an office at 74 Trinity Place, New York, to act as agent in the United States for foreign supplies of ores and other raw materials for the iron and steel industry. Among the companies he will represent are Manganexport G. M. B. H., Georgian manganese ores; Skelleftea Gruvaktiebolaget, arsenic and gold ores; Luossavaara-Kiirunavaara Akt., Swedish iron ore, and the Broken Hill Proprietary Co., Ltd., Australian manganiferous iron ores.

C. H. MACDONALD, who has been manager of the market research department, Colorado Fuel & Iron Co., Denver, Colo., has been appointed director of sales of that company. In his new capacity Mr. Macdonald will have general charge of the sales department as well as the market research department and will report to the executive vice-president.

F. H. LOOMIS, who was general manager of sales Trumbull Steel Co., at the time of its acquisition by Republic Iron & Steel Co., and since has been head of the strip steel division, has been appointed assistant general manager of sales, succeeding A. E. WALKER, now general manager of sales of the company.

W. S. LIPPINCOTT, of the Bethlehem Steel Co., Philadelphia, was presented with a silver trophy for the Philadel-

phia Steel Club golf championship this season, at a regular meeting of the club, Nov. 12.

JAMES R. STUART has resigned as superintendent open-hearth department, Colorado Fuel & Iron Co., Pueblo, Colo. The resignation is effective Nov. 15, after which Mr. Stuart will be located at 1701 Lake Avenue, Pueblo.

J. A. HART, purchasing agent Baldwin Locomotive Works, Eddystone, Pa., has been appointed general purchasing agent, succeeding W. A. RUSSELL, vice-president in charge of purchasing.

A. S. HAWKS, formerly chief engineer of the Busch-Sulzer Diesel Engine Co., St. Louis, has been made assistant works manager at the Buffalo plant of the Worthington Pump & Machinery Corporation. Prior to his St. Louis connection he was in the gas engine departments of the Bethlehem Steel Co. and the Allis-Chalmers Mfg. Co.

ISHAM KEITH, who has been with the Niles-Bement-Pond Co. in its New York sales department, has been appointed sales agent in the Syracuse, N. Y., territory.

DR. WOLFGANG KRÜGER, foreign secretary of the Vereinigung der Deutschen Arbeitgeberverbände, with headquarters at 2 Burggrafenstr., Berlin W., Germany, is now in the United States studying the economic position of the major industries of this country, including the labor situation. His organization is the confederation of German employers' organizations. He sails for Germany on Nov. 22 on the Dresden but, meanwhile, may be reached in care of the Industrial Relations Counselors, Inc., 165 Broadway, New York.

G. H. HEDRICK, who has been in charge of the Chicago office of the Thomas Spacing Machine Co., has been elected vice-president and transferred to the main office at Pittsburgh, and E. C. Thomas, who has been in the Pittsburgh sales office, has been transferred to Chicago to succeed Mr. Hedrick.

C. W. MARWEDEL, 76 First Street, San Francisco, has been appointed agent in that district for William Jessop & Sons, Ltd., Sheffield, England, steel manufacturer and exporter.

J. G. GROSS, for the last 12 years in charge of steel pipe sales for J. K. Larkin & Co., Inc., 253 Broadway, New York, has been elected secretary of that company.

FRANK J. WACHTER, for a number of years in the sales department of Landers, Frary & Clark, New Britain, Conn., has been made sales manager of the Union Mfg. Co., New Britain.

SAMUEL M. PHILLIPS has resigned as general manager of the Stewart Furnace Co., Sharon, Pa., to become vice-president in charge of operations for the Valley Mould & Iron Corporation, Hubbard, Ohio.

STRICKLAND KNEASS, JR., general manager and chief engineer Costello Engineering Co., Pittsburgh, on Nov. 15 becomes chief engineer of the A. M. Byers Co., Pittsburgh. He was graduated from Rensselaer Polytechnic Institute, Troy, N. Y., in 1911, and after a year in the steam engineering department at the Duquesne Works, Carnegie Steel Co., he became steam engineer for the Youngstown Sheet & Tube Co., Youngstown. He went with

the Costello company in 1925. In his new connection he will be in charge of the construction of the Byers new process iron plant at Harmony, Pa. His successor with the Costello company is W. N. McCUTCHEON, who has been with the Linde Air Products Co.

MARCEL PAUL, chairman of the board and managing director Societe Anonyme des Hauts-Fourneaux et Fonderies de Pont-a-Mousson, Nancy, France, one of the large European makers of cast iron pipe, arrived in New York, Nov. 13, on the Ile de France. He is accompanied by E. ROY, chief technical adviser of the Pont-a-Mousson associated companies.

OBITUARY

LOUIS W. WILLIARD, for the past six years in the structural steel sales department of the Carnegie Steel Co., Pittsburgh, died in that city on Nov. 6, aged 38 years. Previously Mr. Williard was in the Washington office of the Carnegie company. A brother, A. R. Williard, is assistant manager of the Cleveland office of the Carnegie Steel Co.

JAMES B. PIERCE, one of the pioneer blast furnace men in the Shenango Valley, and who, during his connection with the production of pig iron, participated in the transition from furnaces built of stone to those of steel, died recently at his home at Sharpsville, Pa. Mr. Pierce's father started the iron industry in the Shenango Valley and his sons followed him in the business. James B. Pierce was born at Mount Hickory, near Sharpsville, Sept. 2, 1856. He attended Buchtel College, Akron, Ohio, from which he was graduated in 1873 with degree of bachelor of science. He then entered Stevens Institute of Technology, Hoboken, N. J., receiving the M. E. degree in 1877. Upon his return to Sharpsville he operated the Mount Hickory furnaces for several years. Later the old stone stack of the Sharpsville Furnace Co. was rebuilt and he operated it until 1906 when it was sold to Alec Thompson and his associates. He was a member of the Bessemer Pig Iron Association, a group of independent furnaces in the Shenango and Mahoning Valleys. He had been a member of the American Institute of Mining and Metallurgical Engineers since 1886.

THOMAS A. DEVILBISS, president Devilbiss Co., Toledo, Ohio, died November 9, age 50 years. He had been in poor health for the past two years. He was well known as a manufacturer of spray painting equipment.

LAWRENCE A. BARRETT, mechanical engineer for the Oilgear Co., Milwaukee, died Oct. 31. He was a graduate of Marquette University, Milwaukee, and had taken out a number of patents relating to the application of oilgear transmission to machine tools.

RICHARD C. DRINKER, for 14 years consulting metallurgist of the Bethlehem Steel Co., and chief metallurgist for the Emergency Fleet Corporation during the World War, died Nov. 6, at his home in Quincy, Mass.

FREDERICK KENT COPELAND, president Sullivan Machinery Co., Chicago, since its organization in 1905, died suddenly on Nov. 10 in the Claremont, N. H., General Hospital, following an operation for appendicitis. He was born at Lexington, Mass., in 1855, and was graduated in civil engineering from the Massachusetts Institute of Technology in 1876. After leaving college he spent two years in the operating department of the Chicago, Burlington & Quincy Railroad and later was engaged in mining engineering work in the West. In 1884 he organized the Diamond Prospecting Co. which was later merged with the Sullivan company. He was president of the National Metal Trades Association in 1908 and 1909 and was also a member of the American Society of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers and the Western Society of Engineers. A son, FREDERICK W. COPELAND, is at present a vice-president of the Sullivan company.

JOHN B. MURPHY, vice-president Kohler Co., Kohler, Wis., manufacturer of plumbing supplies, died Nov. 12. Mr. Murphy was born 74 years ago at Avoca, Wis., and was for 20 years associated with the Kohler Co.

Railroad Equipment

Freight Cars Ordered Total 6800

PLACING of orders for more than 6800 freight cars, principally by two Canadian roads, was the feature of this market in the past week. Outstanding orders were 4680 by the Canadian National, 1125 by the Canadian Pacific and 1000 by the American Refrigerator Transit Co., subsidiary of the Missouri Pacific. Several Western and Southern roads are inquiring for a total of 67 locomotives, and freight car inquiries include 200 gondolas for the Great Northern, 300 tank for the Chicago, Rock Island & Pacific and 250 automobile, 50 flat and 50 tank cars for the Western Pacific. Details of the week's business follow:

Canadian National has ordered 1000 automobile cars from Pressed Steel Car Co. and has distributed 3680 freight and 65 passenger cars as follows among Canadian builders: 1600 box, 30 tank, 30 sleeping and 10 buffet parlor cars with Canadian Car & Foundry Co.; 750 box and 300 flat cars and 25 first class coaches with National Steel Car Co., Ltd., and 500 refrigerator and 500 ballast cars with Eastern Car Co.

Canadian Pacific has placed orders for 1125 freight cars and 59 passenger car frames among following Canadian builders: 250 freight refrigerator cars and 15 dining car and 15 first class passenger coach frames with National Steel Car Co., Ltd.; 275 ballast cars and 29 sleeping car frames with Canadian Car & Foundry Co., and 300 flat and 300 coal cars with Eastern Car Co.

Denver & Rio Grande Western has ordered 10 2-8-4 type locomotives from Baldwin Locomotive Works. This road is also inquiring for two baggage and mail and three observation cars.

Pacific Fruit Express is in market for 600 underframes for refrigerator cars.

Great Northern expects to purchase six 4-8-4 type locomotives. This road is also inquiring for 200 50-ton steel gondola cars, but has reduced its inquiry for ore cars from 1000 to 300.

St. Louis-San Francisco is inquiring for 12 2-8-4 type locomotives.

Chicago, Burlington & Quincy is inquiring for six 2-10-4 type locomotives.

American Refrigerator Transit Co. has ordered 1000 refrigerator cars from Pressed Steel Car Co.

Atchison, Topeka & Santa Fe is in market for 50 special type sleeping cars.

Chicago, South Shore & South Bend has ordered 10 steel passenger cars from Standard Steel Car Co.

Buffalo, Rochester & Pittsburgh has ordered repairs to 500 steel hopper cars, divided equally between American Car & Foundry Co. and Pressed Steel Car Co.

Chicago, Rock Island & Pacific is in market for 300 tank cars.

Western Pacific is asking for prices on 250 automobile, 50 tank and 50 flat cars. This road also expects to purchase 10 2-10-4 type locomotives.

Kentucky & Indiana Terminal will buy nine eight-wheel switching locomotives.

Louisville & Nashville will soon come into market for 24 2-8-4 type locomotives.

German Lockout Aids British Trade

Continental Buyers Seek British Material—Belgian Exports to Far East Improve—German Exports Increasing

(By Cable)

LONDON, ENGLAND, Nov. 12.

CLEVELAND pig iron is still quiet in the domestic market, but export inquiry is improving as a result of the German lockout. Current output is being absorbed by local steel works, so that increased production is expected if demand is stimulated.

The hematite market is moderately active and furnaces are asking 1s. (24c.) per ton advance for early 1929 delivery. One furnace has been blown in at Normandy and two will go into blast at Ayresome about the end of the year. Foreign ore continues quiet.

Finished iron and steel business is dull in heavy material, but makers are expecting increased Continental demand if the German lockout is prolonged. Semi-finished material and small sizes of finished products are fairly active.

Tin plate is quiet and some works have closed their mills because of scarcity of prompt shipment specifications. Most plants are well sold for delivery early next year.

Galvanized sheets are moderately active with a fair volume of small lot buying, but substantial demand is lacking. Many mills are well placed for the rest of this year, but others are in need of specifications for prompt shipment. Black sheets are quiet.

October exports of pig iron were

36,000 tons, of which the United States took 7300 tons. The total iron and steel exports for October were 377,000 tons.

Continental mills are in a strong position, because of the German situa-

tion, and sellers are generally reluctant to enter into commitments at present prices. British users are acting cautiously, with active export demand reported coming direct from Continental traders.

British Hematite Furnaces Active, but Steel Trade Is Quiet

LONDON, ENGLAND, Oct. 28.—Conditions in the iron and steel trade continue dull, and with winter approaching the outlook is rather unfavorable. At the end of September only 131 furnaces were in blast throughout the country, and employment statistics compiled by the *Labour Gazette* reveal the poor state of business. In the pig iron industry at the end of September the percentage of unemployed was 18.4, a decrease from August of 0.5 per cent, but an increase compared with a year ago of 3.2 per cent. In iron and steel mills, the percentage of unemployed was 20.9, a decrease from August of 2.3 per cent, but an increase compared with a year ago of 3.3 per cent. These recent decreases in unemployment are attributed almost entirely to the reduction in foreign competition caused by the rise in Continental selling prices. This is most marked in semi-finished material, for which demand

has been strong from bar, structural and sheet mills.

Pig iron continues quiet, but Cleveland producers are maintaining prices, as output has been considerably restricted. Most sales are to local associated steel works, and export demand continues negligible. Hematite iron shows some improvement. The large stocks have been almost entirely absorbed. Both domestic and Continental users have taken fair tonnages, so that more furnaces may go into blast on the Northeast coast, but probably not until after the Christmas holidays.

In finished material, the building trade and engineering plants still aid in maintaining fair operation of mills, but the mills rolling heavy plates and shapes for the shipbuilding trade, continue depressed.

According to *Lloyd's Register*, the tonnage of vessels under construction in the United Kingdom and Ireland

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.31

(a) Nominal.

at the end of September was 1,089,760 tons, a reduction from the previous quarter of 112,850 tons, and from September, 1927, of 446,656 tons. Tonnage under construction abroad is 1,431,582 tons, a decrease from the end of the second quarter of 26,270 tons. The total world tonnage is, therefore, 2,521,342 tons, of which

43.2 per cent is being constructed in this country and Ireland.

Tin plate makers, while assured of plenty of work during the early months of next year, need specifications for the next two months, and have found it necessary to restrict output further for the next three months.

Belgian Export Trade Improves

Good Buying by China, India and South America—Prices Are Firm and Deliveries Extended

ANTWERP, BELGIUM, Oct. 26.—Demand is active both in the domestic and export markets, and prices are quite stable. Export trade has shown considerable improvement, with large orders booked for shipment to South America, China and India and some small business entered for delivery in the United States. Mills appear satisfied that the present level of export prices is not too high to permit some good business, as world requirements of steel are still large.

Deliveries are becoming more extended. Mills are quoting January and February shipment on certain products, with March the earliest delivery on small sizes of steel bars. French competition is not regarded as serious at present, and the lockout in Germany is expected to bring some good tonnage to Belgian mills.

Pig Iron.—Most furnaces have a good backlog of business and demand has begun to increase. Phosphoric foundry iron for export is quoted at about £3 5s. (\$15.84) per ton, f.o.b. Antwerp, with no concessions reported. Costs of production continue high, with scrap still scarce and blast furnace material bringing 105 Belgas (\$15.08) per ton. In the domestic market some concessions on foundry iron have been made to meet the competition of British and Dutch iron.

Semi-Finished Material.—Improve-

ment in demand for finished products has reduced available supplies of billets, blooms and sheet bars, so that prices are quite firm. Billets range from £4 18s. (\$23.81) per ton for 3-in. to £5 2s. (\$24.79) per ton for 2-in. Blooms are quoted at £4 8s. (\$21.38) per ton for 8-in. and larger, £4 10s. (\$21.87) per ton for 6-in., and 4-in. blooms are not available. Sheet bars are firm, following heavy buying by domestic sheet mills, and prices range from £5 1s. to £5 1s. 6d. (\$24.54 to \$24.66) per ton, f.o.b. Antwerp.

Finished Material.—Prices are firm and the market appears to be stabilizing at the present level, despite efforts of consumers to obtain concessions. The minimum quotation on steel bars is £6 2s. per ton (1.35c. per lb.), f.o.b. Antwerp, and small lots bring as much as £6 4s. per ton (1.37c. per lb.). Certain small sizes cannot be delivered by mills before March, and January-February is the usual delivery offered on other sizes. Beams are firmer at £5 2s. 6d. per ton (1.13c. per lb.), and medium-sized angles are quoted at £5 17s. 6d. per ton (1.30c. per lb.). Corrugated steel bars are quoted at £6 6s. 6d. per ton (1.39c. per lb.), and hot-rolled hoops are firm at £6 5s. per ton (1.38c. per lb.). Heavy-gage sheets are in good demand, but the light gages are encountering British competition.

cranes, hoists and equipment for blast furnace plants, steel works and rolling mills. Manufacturers of scales, pumps and compressors reported a favorable tendency. For the most part the activity of manufacturers of crushing machinery was unsatisfactory.

"The slowing up of business, which has been noticeable for some time in Germany," the report said, "has fortunately not yet given any signs of leading to a real crisis, and industry in general has been making every effort to prevent such an occurrence. German manufacturers are being warned against increased production costs. When one compares the German Statistical Office's index of machinery prices with the cost figures of the association of German Machinery Manufacturers, it is noted that the increase in machinery prices since the beginning of this year has been only about 54 per cent of the increase in production costs. From this it can be seen that the relation of production costs to profits has become steadily worse since the first of the year. This situation is a source of concern to the German machinery industry, especially in view of the keen competition experienced from foreign manufacturers."

Reparations Deliveries in German Exports

HAMBURG, GERMANY, Oct. 29.—Heavy deliveries of material on reparations account are a feature of German export trade that does not appear in the monthly statistics showing the trade balance. Since 1925, deliveries of steel for reparations have about trebled and, with a total of 12,800,000 m. (\$3,076,400) shipped in September, reparations deliveries were 105 per cent greater than in the same month of 1927.

Japan has been a heavy buyer of steel from Germany against reparations account, taking sheets, machinery, structural material and hardware. It is receiving about 1,200,000 m. (\$285,600) per month in steel products on reparations, which would otherwise be purchased in the open market.

German Machinery Makers Not Prospering

Costs of Production Advancing Twice as Fast as Prices—Keen Competition from Abroad

WASHINGTON, Nov. 9.—Further decline in domestic German machinery business is evident from figures for September issued by the German Machinery Manufacturers' Association (Verein Deutscher Maschinenbau-Anstalten), says a report received by the industrial machinery division, Department of Commerce. The number of firms reporting an unsatisfactory number of inquiries increased by about 15 per cent as compared with August. Domestic orders also decreased, though to a smaller degree. Export business was not maintained at the August level, a much smaller number of foreign inquiries and orders being reported. Plant activity,

measured by the number of working hours, remained at 75 per cent of normal.

The number of inquiries received by the material-working machinery manufacturers was reported satisfactory with regard to both domestic and foreign markets. Business in the textile machinery industry remained quiet, although a seasonal upward trend had been expected. Seasonal influences, coupled with an exceptionally good harvest, favored the domestic market for power-generating machinery, but export business in this line did not develop so favorably. Unfavorable business was reported by firms specializing in construction of

German Aluminum Price May Be Further Reduced

HAMBURG, GERMANY, Oct. 29.—It is believed certain that the aluminum cartel will shortly reduce the price of aluminum by £5 6s. per ton (1.16c. per lb.), from the present level of £95 per ton (20.94c. per lb.). Members of the cartel are understood to consider recent increases in the price of copper as offering an opportunity for them to expand the market for aluminum. Since 1927, German consumption of aluminum alloys serving as copper substitutes, such as silumin, lautal and alumin, has been increased about 350 per cent.

German Export Trade Good

Prices Show Tendency to Decline—Mills Will Seek Larger Quota in Reorganized International Cartel

BERLIN, GERMANY, Oct. 28.—Export prices of steel, reflecting the weakness in Belgium, have declined 2 to 4 m. (48c. to 95c.) per ton since September, but are still at a higher level than a year ago. While the high tide of export activity, which set in near the end of 1927, seems to have been passed, recovery is expected next year, with crops generally satisfactory and a good outlook for building construction in the spring. In the third quarter of this year, German mills exported 922,753 metric tons, only slightly exceeding their export quota of 900,000 tons fixed by the International Steel Cartel.

On the eve of the lockout in the steel industry, affecting about 200,000, the domestic market has been but little affected. Demand for semi-finished material is rather limited, and the market on bars and bands is weaker, with deliveries reduced to about two weeks. Sales of tubes and sheets have also declined, and production schedules of wire rod makers are smaller. However, a good volume of export business has been booked by German mills in the past three months. Foreign sales of wire and wire products have developed to satisfactory proportions, but the capacity of German works is about double the pre-war output.

The International Wire Rod Cartel

will be prolonged until the end of 1929, and the West European Pig Iron Association has been renewed until Jan. 31, 1929, to permit reorganization. Negotiations are to be begun early in 1929 with the object of prolonging, or reorganizing, the International Steel Cartel, following the termination of the existing agreement at the beginning of the second quarter. It is claimed that German mills require better terms in the new, or reorganized, steel cartel, especially in the export quota, to offset a declining domestic market.

The agency for selling Georgian manganese ore has been awarded to the Rawack und Grünfeld A. G., Berlin, by the Mangan Export G. m. b. H., which was established by the Russian Government to direct the sale of Georgian and Nikopol manganese ore and Krivoi Rog iron ore. This agreement comes as a result of liquidation of the Harriman concession and is not unexpected, as the Rawack und Grünfeld A. G. has been the European selling agent for Nikopol manganese ore and Krivoi Rog iron ore since 1924. The new agency covers selling rights in a number of important European consuming countries, but does not include the United States. Operation of the Georgian mines has been taken over by the Russian Government.

last fiscal year than in the year before, amounting to \$102,000,000. And a once minor item, that of machine-made office specialties, such as typewriters, adding machines, cash registers and the like, gained 20 per cent in value of export trade during the fiscal year and established a sales total of over \$44,000,000, making a place for the first time as one of our 20 leading exports.

Electrical machinery and apparatus of all kinds represents another substantial advance in our sales abroad during recent months. Electrical manufacturers sold abroad \$87,000,000 worth of their products during the past fiscal year, an increase of 5 per cent over the year preceding.

Even the item of manufactured cotton, whose position in our export trade has been subjected to intense foreign competition recently, made a substantial advance during the past fiscal year. Its growth of \$12,000,000 was 9 per cent over the preceding year, its sales amounting to over \$135,000,000.

More than one-half of all our exports, or about 54.5 per cent, during the calendar year 1927, were bought by the purchasers of Canada, the United Kingdom, Germany, Japan and France, which are generally classed as our five principal competitors. During the same period these nations also supplied us with 38.4 per cent of our imports.

Our imports for the fiscal year just past were \$627,000,000 less than our exports, or \$4,146,000,000. They show a reduction of about \$319,000,000 from the preceding fiscal year, chiefly owing to price recessions on important raw products such as rubber, tin and silk.

Our imports of manufactured goods have increased by \$680,000,000 during the past six years, while the increase in our exports of manufactures is almost 50 per cent greater than that amount, of \$985,000,000.

Exports This Year in Record Volume

Manufactured Goods, at Nearly Three-Quarters of Total, Highest Proportion Ever Attained

AMERICAN export trade, on the basis of the first nine months' figures for this year, is larger in volume than in any previous year and larger in value than in any year since 1921, says the National Foreign Trade Council in a report on 1928 foreign trade.

Of the \$3,563,000,000 worth of exports reported up to the end of September about 73 per cent, the highest proportion on record, the council points out, represents goods wholly or partly manufactured. About one-fifth of these manufactured goods go to Latin America, where we are now selling more than our three leading competitors—England, France and Germany—combined, and where we are now the leading supplier to every one of the 20 republics south of the Rio Grande.

American manufactured exports, valued at more than \$2,600,000,000, which have been sold abroad during the first nine months of this year, exceed by more than \$50,000,000 our entire exports for the year 1913 of raw

and manufactured goods combined, and exceed the exports of all commodities from any other nation except Great Britain for the whole of 1927.

They represent a substantial gain over recent years for many important American industries. The automotive industry notably has increased its sales abroad, and now contributes 14 per cent, the largest proportion of American export trade in manufactures it has ever had. During the fiscal year just closed \$425,000,000 worth of automotive manufactures of all kinds were exported, or 16 per cent greater than for the preceding year.

Other notable increases in this field of export for the fiscal year include a 10 per cent increase in industrial machinery. The chief items are mining, oil, construction and metal-working machinery, engines and locomotives. They comprised about 6 per cent of our manufactured exports and amounted in value during the past fiscal year to \$210,000,000.

We also sold abroad 25 per cent more agricultural machinery in the

German Steel Activity Drops in September

WASHINGTON, Nov. 10.—Both exports and imports in the German iron and steel trade showed declines in September when compared with August, according to a radiogram received by the Iron and Steel Division, Department of Commerce, from Trade Commissioner James E. Wallis, Jr., Berlin. Production also showed a loss. Exports dropped to 407,563 metric tons from 433,707 tons, while imports decreased to 156,596 tons, as compared with 177,526 tons.

Pig iron output declined to 985,413 tons as against 1,030,837 tons, and open-hearth production fell to 1,189,521 from 1,329,345 tons. The September returns were somewhat surprising in view of the fact that Germany only recently succeeded in having its export quota raised from 275,000 to 300,000 tons a month.

German Bureau Increases Steel Use

New Manufactures Developed in Past Year—Relations Established with American Organizations

THE Steel Trade Extension Bureau of the Stahlwerksverband, Düsseldorf, Germany, established a little more than a year ago, has been quite successful, according to Kurt Orbanowski, director of the bureau, who is at present in New York. Mr. Orbanowski organized the bureau and has succeeded in introducing a number of new lines of manufacture in Germany, one of the most important of which was steel office furniture of the high quality that has been produced in the United States for a number of years. Among other steel products which his bureau has aided in popularizing in Germany are silos, metal roofing, kitchen and bedroom furniture, metal partitions, window frames and sheet metal tiles. At present he is studying the possibility of introducing into Germany steel containers for shipment in freight cars of less than carload lots of material. He is also gathering information on the use in the United States of steel frames in small and medium sized buildings.

Steel silos have apparently met with the approval of the German farmer and Mr. Orbanowski has been investigating their use in the United States. Germany has only about 2000

silos on the farms of the country and of these about 15 per cent are of steel, the greater part of concrete and tile and a few of wood construction. In the United States, he received an estimate from the Department of Commerce that there are 560,000 silos, of which only about 2.5 per cent are of steel construction, 25 per cent of concrete and the remainder of wood.

The steel silo, as used in Germany, is constructed of pressed steel sheets, usually copper bearing, or of "Armco" iron. The sheets are delivered to the farmer already bent with a flange turned to the inside, punched and ready to bolt together. No. 16 gage sheets are generally used on the lower part of the silo, No. 14 gage midway and No. 16 gage at the top.

The Steel Trade Extension Bureau in Germany has established contact with similar organizations in the United States, such as the American Institute of Steel Construction and the Sheet Trade Extension Committee of the Association of Flat Rolled Steel Manufacturers. Information on new uses of steel is exchanged and cooperation is expected to contribute to increased use of steel throughout the world.

Prices of Imported Steel Advance

German Lockout Results in Higher Quotations by European Mills—American Black Sheets for Japan Higher

NEW YORK, Nov. 13.—The lockout in the German heavy steel industry has been reflected in the export prices of French, Belgian and Luxemburg mills, which have been advanced in the past week from 2s. to 3s. (49c. to 73c.) per ton. Importers representing, or dealing with, German mills have received cabled advices that no offers can be made at present on bars and structural material. Sheet and strip mills, however, are still operating and selling for export, although, should the lockout be protracted, they will be forced to suspend because of a shortage of semi-finished material. Meanwhile, sellers in New York are not perturbed, as demand for structural material and bars is decidedly small and buying for spring delivery is not expected to develop for another month or more.

A decision is expected about the end of this month from the Customs Court of Appeals on the appeal of the Government against the decision of the United States Customs Court that reinforcing bars are dutiable as construction material at 20c. per 100 lb. instead of as bars at 30c. per 100 lb. No action is yet reported on the question of marking foreign steel with the country of origin, but importers believe that suit will be instituted

before long by an American steel company against several importers to test the present ruling of the Treasury Department that billets, blooms, plates, shapes and bars are not subject to marking.

Export steel business is small. Chinese merchants continue to inquire for wire shorts, but mills here show no interest in offering material, even at the present high prices quoted by Chinese buyers. Japanese merchants are small buyers of tin plate, on which the price is unchanged for export at \$5.15 to \$5.20 per base box, c.i.f. Japanese port. Light-gage black sheets have been advanced about \$1 a ton by American mills, which are quoting about \$77 per ton, c.i.f. Japan, although the British price and the market in Japan, as established by the Kawasaki Dockyard Co., the local maker, is about \$72.50 per ton.

Exports of iron and steel from the United States to Japan have been unusually small recently. Outstanding purchases of steel have been in scrap and tin plate. In September, a total of 11,279 gross tons of steel scrap and 6888 gross tons of tin andterne plate went to Japan. Black sheet exports totaled only 2137 gross tons. Even this small tonnage of black sheets is accounted for at pres-

ent high prices of the American product by the fact that certain Japanese galvanizing plants have established brands of galvanized sheets, for which they are known to use certain American makes of black sheets. An interesting item in the September exports to Japan is 7246 gross tons of pig iron. As Japanese consumers receive their pig iron requirements from domestic sources or from China or India and seldom buy in the United States, this is believed by Japanese traders to be a distress tonnage of iron.

Germany to Build Russian Cement Plant

HAMBURG, GERMANY, Oct. 29.—A contract for a cement plant with an annual capacity of 400,000 tons, to be built near Novorosiska in the Ukraine, has been awarded by the Russian Government to the Friedrich Krupp A. G. The Hanomagworks at Hanover, Germany, has booked an order for 12 locomotives for the Bengal & Northwestern Railways, and the Skoda Works in Czechoslovakia has received a contract for 120 heavy tank cars from the Burma Railways in India.

Although Russian steel production is gradually increasing to the pre-war level, a large percentage of the present output is reported to be off-grade and suitable only for scrap. Officials at the Dzershinski works at Dnepropetrowsk report that as much as 20 per cent of the total steel output is scrapped following inspection at the plant.

French Shipyards and Locomotive Shops Busy

PARIS, FRANCE, Oct. 22.—Domestic business continues large. Shipyards are obtaining desirable contracts as a result of the availability of credits for ship construction. Competition from Dutch and British shipbuilders is keen. Builders of railroad rolling stock are well occupied with contracts. The Algerian State Railroads have recently placed 10 locomotives with the Creusot Works, 10 with the Ateliers de Construction du Nord de la France, 15 with the Société Lorraine at Lunéville and a number of passenger coaches with the Compagnie Française de Material des Chemins de Fer.

British consumption of copper, tin and zinc during the first six months of 1928 increased over that for 1927, but the total increase for the three metals was almost balanced by a decline in the consumption of lead, according to the Department of Commerce. The London Metal Exchange reports that during this period the apparent consumption of copper increased 5 per cent, tin 6 per cent and zinc 3 per cent, while the use of lead declined 8 per cent.

Sheet-Metal Ware Shipments Continue Large

Shipments of enameled sheet-metal ware in September are reported by the Department of Commerce at 352,484 dozens valued at \$1,372,242. This compares with 358,811 dozens in August valued at \$1,354,316 and with 310,823 dozens in September, 1927, valued at \$1,285,854. September shipments of galvanized sheet-metal ware were 189,789 dozens valued at \$742,188. This compares with 186,864 dozens in August valued at \$746,580 and with 172,382 dozens in September, 1927, valued at \$695,077.

Shipments of enameled sheet-metal ware in nine months have reached 3,123,160 dozens valued at \$11,776,715. This shows an increase of 4 per cent in number and over 9 per cent in value compared with the first nine months of 1927. Both white ware and gray ware showed decreases from last year in both quantity and value. The gain was wholly in colored ware, which advanced in nine months from 168,767 dozens valued at \$696,075 to 556,474 dozens valued at \$2,757,256. The nine-month totals in colored goods this year are more than double the 12 months of last year.

Galvanized sheet-metal ware shipments in nine months have amounted to 1,774,297 dozens valued at \$6,827,933, a moderate gain from last year's 1,690,734 dozens valued at \$6,374,034.

Larger Shipments of Electric Trucks and Tractors

October shipments of electric industrial trucks and tractors are reported by the Department of Commerce at 134, compared with 118 in September and with 109 a year ago. The October total comes within two units of equaling the highest record of more than a year—that of last April. Exports amounted to 20 units, which is the largest total since June of last year. Of the domestic shipments, five units were tractors and 109 other types. The number of tractors has not been lower in 14 months and only once in two years.

October Lake Ore Shipments Increased

Iron ore shipments from the Lake Superior region in October were 8,453,952 tons. This compares with 6,722,757 tons in October, 1927, the increase this year being 1,731,195 tons or 25.76 per cent. For the season the

shipments to Nov. 1, this year, have been 49,719,931 tons, an increase of 613,217 tons or 1.25 per cent for this year. The table gives the shipments for October and for the season in 1928 and 1927 in tons.

Highest October Building Construction on Record

Building construction in the 37 States east of the Rocky Mountains in October is reported by F. W. Dodge Corporation at \$597,104,000. This is about 3 per cent ahead of September and is 6 per cent ahead of October last year. It represents the largest total for any October, and covers about 91 per cent of the country's total construction. The month's figure brought the aggregate for 10 months to \$5,724,048,000, a gain of 7 per cent over \$5,359,298,000 for the corresponding period last year.

October building construction included \$239,692,000 for residential buildings, this being 40 per cent of all, in line with many months past. Public works and utilities absorbed \$148,697,000, commercial buildings \$67,330,000 and industrial projects \$62,259,000.

Both the district covering New York State and northern New Jersey and the Middle Atlantic States group showed the largest October construction volumes on record. New York and northern New Jersey account for \$187,782,000 of the total, while the Middle Atlantic States show \$77,785,000. These two together make up nearly half of all the construction reported.

Increase in Industrial Stocks of Coal

Stocks of anthracite and bituminous coal in the hands of industries in the United States and Canada on Oct. 1 are estimated by the National Association of Purchasing Agents at 40,778,000 net tons. This compares with 40,090,000 tons on Sept. 1 and represents the second gain in the figure in a year. The total on Oct. 1, 1927, 60,154,000 tons, was subjected to a continuous decrease until Aug. 1, when stocks aggregated 39,415,000 tons.

It is estimated that on Oct. 1 the steel mills had a 31-day supply, the railroads a 31-day supply, by-product coke plants, 22 days; electric utilities and coal gas plants, 52 days; and other industries, 36 days, making the average for the country 35 days.

Total coal production for October

is estimated by the Bureau of Mines of the Department of Commerce at 50,267,000 net tons for bituminous coal and 8,621,000 tons for anthracite. These figures represent increases of 22 per cent for bituminous coal and more than 42 per cent for anthracite, compared with September, and 15 per cent for bituminous coal and nearly 18 per cent for anthracite, compared with October, 1927.

Steel Corporation's Orders Increased in October

Unfilled orders of the United States Steel Corporation increased in October for the third month in succession. The total on Oct. 31 was 3,751,030 tons compared with 3,698,368 tons on Sept. 30, an increase of 52,662 tons. In September the increase was 74,325 tons and in August it was 53,116 tons. The decrease in July was 66,082 tons. A year ago, on Oct. 31, the unfilled orders were 409,990 tons less than this year. The table gives the reported figures for the last 22 months.

		1928	1927
Jan.	31	4,275,947	3,800,177
Feb.	28	4,398,189	3,597,119
Mar.	31	4,335,206	3,553,140
April	30	3,872,133	3,456,132
May	31	3,416,822	3,050,941

Nov.	30		3,454,444
Dec.	31		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

Immigration Shows Further Decreases

WASHINGTON, Nov. 13—Immigrants to the number of 29,317 were admitted to the United States in September, according to the Bureau of Immigration. Of this total 14,300 were males. The total immigration during the first three months of the current fiscal year showed a decrease of 8210 or 9.9 per cent as compared with the corresponding period of last year. The decrease was largely confined to the Western Hemisphere, both Canadian and Mexican immigration dropping.

Luxemburg Output Close to 1927 Figures

Statistics covering the production of pig iron and raw steel in Luxemburg indicate the industry this year is maintaining the output level of last year, says a report received from Vice Consul James E. Parks, Luxemburg. The average monthly production of pig iron for nine months of the current year is 230,018 tons as against 226,926 tons monthly for all of 1927, while the output of steel is 213,130 tons so far this year and 204,870 tons in 1927.

Machinery Markets and News of the Works

Business Volume Declines

Machine Tool Orders Not Quite Up to Those of October,
Though Still at a High Level

A SLIGHT shrinkage in the volume of machine tool orders is reported from several important centers, but business is holding to a fairly high level. The quantity of pending inquiry is large, and, with business men taking an optimistic view of the election result, no obstacle appears to stand in the way of a sustained demand during the remainder of the year, at least.

The machine tool trade entertains sanguine expectations of increasing demands from the aviation industry. The development of this industry is particularly promising in the East. The Wright Aeronautical Corporation, Paterson, N. J., is expected to buy another large list of tools for plant expansion not later than January, while the Curtiss Aeroplane & Motor Co., Buffalo, has recently been placing orders and has more shop equipment to buy. The Moth Aircraft Corporation and the Chamberlin Aeronautical Corporation have taken over

idle plants which will be converted to the manufacture of airplanes. Indications are that the aviation industry will have a large development in 1929.

The automobile industry and companies supplying parts to automobile makers continue to buy tools. Among their purchases in the past week was an order totaling \$50,000 for high production lathes, while two other companies each took five lathes and a piston ring manufacturer bought several.

Agricultural implement and tractor manufacturers have bought miscellaneous lots of tools. The railroads are taking a more active interest in new shop equipment.

The Industrial Rayon Co., which recently put out a machine tool list for its new plant at Covington, Ky., has bought three pipe machines for use in construction work.

An outstanding export inquiry is for 12 tools for a railroad in South America.

New York

NEW YORK, Nov. 13.—Developments in the manufacture of airplanes and airplane motors promise an expanding demand for machinery for this growing industry. Some sellers of machine tools in this district look to aviation as a source of considerable business during 1929. Two companies which have been through the development stage have taken plants for the manufacture of airplanes; the Chamberlin Aeronautical Corporation will occupy the former plant of the Clark Thread Co. in Jersey City, and the Moth Aircraft Corporation, Graybar Building, New York, has bought the former U. S. Cartridge Co. plant at Lowell, Mass. Both companies, it is expected, will be buyers of shop equipment. A further expansion of facilities by the Wright Aeronautical Corporation, Paterson,

N. J., is in prospect, and it is expected that a large list of tools will be bought not later than January. The Curtiss Aeroplane & Motor Co., Buffalo, has bought a number of tools and will probably add further to its equipment. Machine tool buying during the past week has held at a fairly high figure, although some sellers report that inquiries have fallen off. A good deal of buying is still in prospect, however, and the outlook continues promising.

Sales of Pratt & Whitney division, Niles-Bement-Pond Co., last week included 10 lathes, four die sinkers, a jig borer, profiling machine, bench hand miller, drilling machine and a vertical surface grinder. Niles company sold a 42-in. double rotary planer.

John Ullman has leased space in building at 313 East Twenty-second Street, for manufacture of wrought iron specialties.

Board of Education, 500 Park Avenue, New York, is said to be planning installation of manual training equipment in new Lincoln high school at Ocean Parkway and West Second Street, Brooklyn, to cost about \$2,500,000, for which bids have been asked on general contract. W. C. Martin, Flatbush Avenue Extension and Concord Street, Brooklyn, is architect.

Officials of Henry Klein & Co., 300 Broome Street, New York, manufacturers of display fixtures and equipment, have organized Henry Klein & Co., Inc., to take over and consolidate former company with Improved Office Partition Co., 11 East Thirty-seventh Street, with plant at Elmhurst, L. I., and Driwood Corporation, also with works at Elmhurst. New organization will expand production of display, office and store fixtures and equipment.

M. J. Ort, 424 East 149th Street, New York, architect, has plans for a six-story automobile service, repair and garage building on East Eighty-fifth Street, 80 x 100 ft., to cost approximately \$100,000 with equipment.

Officials of H. F. Holbrook-Henry Brewster Corporation, 420 Lexington Avenue, New York, manufacturer of automobile bodies, have organized H. F. Holbrook Body Corporation, with capital of 500,000 shares of stock, no par value, to take over and expand present company.

Interborough News Co., 244 West Forty-second Street, New York, has asked bids on general contract for six-story automobile garage at 525 West Fifty-second Street, for company motor trucks and cars, to include machine and repair shop, paint shop and other departments, to cost \$180,000. Russell G. Cory, 30 Church Street, is architect and engineer.

Acoustic Products Co., 50 West Fifty-seventh Street, New York, operating Sonora Phonograph Co., Inc., manufacturer of talking machines, has plans for expansion, to include production of automatic resynchronizing sound equipment for talking motion pictures, parts, etc. Company has secured patent rights to World Bristolphone, held by William H. Bristol Talking Picture Corporation, Waterbury, Conn. A new company will be formed to carry out program, combining names of Bristolphone and Sonora organizations.

National Lead Co., 111 Broadway, New York, has plans for new one-story plant, 120 x 175 ft., Brooklyn, to cost about \$200,000 with equipment. William Higginson, 101 Park Avenue, New York, is architect and engineer.

American Gas Accumulator Co., Newark Avenue, Elizabeth, N. J., manufacturer of gas machinery, has awarded general contract to Wilhelms Construction Co., 119 Division Street, for one-story addition, 59 x 140 ft., including improvements in present factory, to cost about \$45,000. William L. Finne, 91 Broad Street, is architect.

Kroydon Co., Burnett Avenue, Maplewood, N. J., manufacturer of golf sticks,

The Crane Market

NEW business in overhead cranes has been small recently, but some substantial inquiries are in the market, such as the list of 5-ton gantry cranes for the Waterfront Service Co., Brooklyn, and a number of bucket handling cranes for the Brooklyn Garbage Removal Co., Brooklyn. A manufacturer in this district has closed on a 5-ton and 12-ton, 33-ft. 8¾-in. span electric cranes with the Niles Crane Corporation and the same maker has received award of a

25-ton, 42-ft. 7-in. span crane. Contractors and industrial users of locomotive cranes have but few outstanding inquiries at present, but the railroads are reported showing increased interest in buying. The New England railroads are understood to be preparing inquiries for steam shovels and ditchers and the Southern Railway has asked for prices on a special type crane to be mounted on a car for track laying. Missouri Pacific is inquiring for three gantry cranes.

Among recent purchases are:

New York Edison Co., New York, three 2-ton hand power cranes, from Manning, Maxwell & Moore, Inc.

New York Central Railroad, New York, 5-ton hand power crane for Harmon, N. Y., from unnamed seller.

Carnegie Steel Co., four 125-ton, with 40-ton auxiliary hoists, 50-ft. 4-in. span, 7-motor, 4-girder double trolley ladle cranes for Clairton works, from Alliance Machine Co.

irons, etc., has asked bids on general contract for one-story addition, to cost about \$30,000 with equipment. D. A. Hopper, 22 Ridgewood Avenue, Irvington, N. J., is architect.

Art Metal Works, Inc., 7 Mulberry Street, Newark, manufacturer of metal novelties, will soon begin work on one and two-story addition, to cost close to \$40,000 with equipment. Henry Baechlin, 665 Broad Street, is architect.

Liberty Auto Radiator Co., 3218 Hudson Boulevard, Jersey City, N. J., will soon award contract for two-story and basement plant unit, to cost about \$30,000 with equipment. Flagg & Stades, 665 Newark Avenue, are architects.

H. E. Salzberg & Co., Inc., 225 Broadway, New York, electrical machinery, has leased factory to be built at Clarke Avenue and Water Street, Jersey City, N. J., totaling about 17,000 sq. ft. floor space, for a machinery rebuilding and repair works.

Warren Engineering Corporation, 117 Liberty Street, New York, has been formed to act as marine agent in United States, exclusive of Pacific Coast and Great Lakes districts, for Warren Steam Pump Co., Inc., Warren, Mass. Through associated organization, L. Katzenstein & Co., company is operating machine repair shop and also manufactures specialties, such as metallic packings for stuffing boxes and slip joints, and handles sale of various types of vibration and speed indicating instruments.

Electric Air Tool Corporation, National Bank Building, Forty-second Street and Madison Avenue, New York, has been organized to manufacture electric air hammers. Tools will be manufactured under contract by Peco Mfg. Co., Philadelphia, and sales will be handled by Gifford Brown Sales Co., 1 Broadway, New York.

Splitdorf-Bethlehem Electrical Co., 392 High Street, Newark, N. J., has organized Splitdorf Rol-Iron Co., a subsidiary, to merchandise Splitdorf rol-iron.

National Flue Cleaner Co., Inc., Groveville, N. J., maker of soot blowers for return tubular boilers, has appointed following sales representatives: Craun-Liebing Co., Cleveland; Dennis Engineering Co., Columbus, Ohio; Bishop Engineering Co., Cincinnati; Power Plant Efficiency Co., Indianapolis, and Rathburn Co., El Paso, Tex.

Knickerbocker, Cram & Co., Inc., 7 East Forty-second Street, New York, has been appointed agent in New York territory for line of lathes manufactured by Boye & Emmes Machine Tool Co., Cincinnati.

Philadelphia

PHILADELPHIA, Nov. 12.—Contract has been let by Railway Track-Work Co., East Thompson and Clementon Streets, Philadelphia, to W. F. Chapman, Jenkintown, for one-story machine shop, 56 x 100 ft., to cost about \$40,000 with equipment.

Diamond Machine Co., 453 North Marshall Street, Philadelphia, has awarded general contract to William Linker Co., 735 Cherry Street, for one-story tool manufacturing plant and machine works on site lately acquired, to cost approximately \$40,000 with equipment. (Corrects typographical error regarding cost of work in this column last week).

Henry A. Hitner's Sons Co., 4501 Richmond Street, Philadelphia, manufacturer of tanks and other iron and steel products, has filed plans for a one-story shop and crane runway.

General Steel Castings Co., Philadelphia, has been formed with capital of \$50,000 by J. P. Murray, 4813 Springfield Avenue, and associates, to operate a local foundry. George E. Chambers, Jenkintown, Pa., and F. Stanley Saurman, Churchville, Pa., are also interested in company.

Atlantic Gypsum Products Co., 40 Central Avenue, Boston, has purchased Pennsylvania Gypsum Co., Chester, Pa., and will continue operations as branch plant. Pennsylvania company will carry out expansion program recently announced, including new pier on Delaware River. It has heretofore been under control of Canada Cement Co., Ltd., which has contracted with Atlantic company for entire supply of gypsum rock for cement mills in future, last-noted company to operate such properties in Nova Scotia. Raw material will also come from this source for Chester mill.

Union Dental Instrument Mfg. Co., 831 Cherry Street, Philadelphia, has awarded general contract to Charles Rose, 260 South Fifteenth Street, for four-story plant, to cost more than \$100,000 with equipment.

Marvel Gear Co., Philadelphia, has been formed by Paul G. Basehore, 14 North Ardmore Avenue, Lansdowne, Pa., and associates, to operate local plant for manufacture of gears, starting devices and equipment. Patrick J. Kilcullen, 3335 West Penn Street, is also interested in new company.

Philadelphia Storage Battery Co., Ontario and C Streets, Philadelphia, has purchased former plant of Saxonia Worsted Mills, totaling 80,000 sq. ft. floor space, and will use for expansion.

L. R. Hillyard, West Chester, Pa., and associates, have acquired plant and busi-

ness of R. S. Newbold & Son Co., Norristown, Pa., manufacturer of rolling mill machinery, steel plate products, etc. New owners will continue operations under present name and will carry out an expansion program.

International Mfg. Co., Pottsville, Pa., has leased space in local building to manufacture metal toys, ventilators and other metal products.

Whiskette Mfg. Co., Terre Hill, Pa., has been organized to manufacture steel wool products consisting of brushes, buffing wheels, rotary brushes, wheel brushes and small devices for domestic cleaning purposes. Company is installing machinery and operations will begin shortly.

United States Sand Paper Co., manufacturer of abrasive papers and cloths, has purchased assets, good will, formulae, etc., of Federal Abrasive Works, Inc., Westfield, Mass., and Standard Abrasive Co., Inc., Garfield, N. J. Business of two companies will be consolidated and administered under name of Standard Abrasive Co., Inc., with office and factory at Garfield, N. J.

New England

BOSTON, Nov. 12.—The past week was the best experienced by local machine-tool dealers in several months, the increased business being shared also by Providence and Connecticut centers. Among the new tools sold were several high-production tools by a Boston firm, two 16-in. x 8-ft. engine lathes, four high-speed lathes, all under 20 in., presses, shapers, planers, radial drills, and light drilling tools, as well as a fair amount of bench equipment. Used tool sales included a 20-in. heavy-duty shaper, 20-in. engine lathe, several drill presses, four power presses, radial drill, planer, and a fair list of small lathes. Most of the buying, both of new and used equipment, was by Massachusetts companies. November gives promise of better sales than September and October combined. Active inquiry for new and used tools has come out the past week. The largest new tool inquiry is from the Atlantic Works, East Boston, Bethlehem Shipbuilding Corporation, Ltd., for 11 tools, in addition to considerable wood-working equipment.

Small tool sales are holding up well. November bids fair to outstrip all previous months this year and is likely to be the biggest month since the war.

Light hammer manufacturers are doing the largest business in their history. The Pneumatic Drop Hammer Co., Boston,

has recently taken two orders for single hammers from a Detroit company, five hammers have just been placed in Indiana, two Ohio cities are taking five hammers, two New York State cities have ordered five, two Massachusetts towns are taking three, and Rhode Island firms, mostly jewelry manufacturers, have ordered six hammers.

American Tube & Stamping Co., Bridgeport, Conn., will build a manufacturing plant. Plans are private.

Lockwood, Greene & Co., Inc., 24 Federal Street, Boston, is preparing plans for a machine shop extension for New Departure Mfg. Co., Bristol, Conn.

O'Connell & Shaw, 134 Newbury Street, Boston, architect, will close bids Nov. 15 for a Boston, Bennett district, high school, with vocational shops, to cost, with equipment, about \$1,539,000.

Holland & Kenyon Machine Co., North Street, Fitchburg, Mass., is taking bids on a one-story plant, 32 x 40 ft.

Eureka Flint & Spar Co., Lewis Street, Trenton, N. J., has plans for a plant at Rockingham, Vt. Miscellaneous handling equipment will be required.

Associated Gas & Electric System, 61 Broadway, New York, has started work on a coal gas plant on Quinsigamond Avenue, Worcester, Mass.

Moth Aircraft Corporation, New York, maker of DH-Moth light airplanes, will shortly be established in plant formerly occupied by United States Cartridge Co., Lowell, Mass. About 400 employees will be taken on for initial operations.

Plant of Vermont Machine Co., Bellows Falls, Vt., formerly owned by Vermont Farm Machinery Corporation, has been taken over by Standard Steel Co., a Connecticut company, which plans improvements.

Wilcox, Crittenden & Co., Inc., 3 South Main Street, Middletown, Conn., manufacturer of marine hardware products, is said to have engaged Lockwood, Greene & Co., 24 Federal Street, Boston, to prepare plans for one-story foundry to cost more than \$45,000 with equipment.

Standard Oil Co. of New York, 26 Broadway, New York, has plans for a storage and distributing plant, with garage and repair shop, at Peabody, Mass., to cost about \$50,000; also for a similar plant at Derby, Conn.

Blanchard Machine Co., 64 State Street, Cambridge, Mass., is having plans drawn for new one-story unit, 90 x 100 ft., to cost about \$35,000 with equipment. Charles T. Main, 201 Devonshire Street, Boston, is architect and engineer.

Southern New England Electric Co., Waterbury, Conn., will take bids at once for new one-story equipment storage and distributing plant, 50 x 100 ft., to cost about \$30,000. Westcott & Mapes, 139 Orange Street, New Haven, Conn., are architects and engineers.

Atlas Mfg. Co., 125 Water Street, New Haven, Conn., manufacturer of hardware specialties, wire goods, etc., has taken over factory on Grant Street for new plant. Plans are under way for extensions, including two one-story additions, 35 x 45 ft., and 20 x 32 ft. It is understood that works of Ansonia Novelty Co., Ansonia, Conn., manufacturer of metal specialties, recently acquired, will be removed to Grant Street factory.

Gustavo Preston, 113 Broad Street, Boston, has been appointed sales representative in that city for Pennsylvania Pump & Compressor Co., Easton, Pa., maker of air compressors and vacuum, centrifugal and air lift pumps.

Lynd-Farquhar Co., 419 Atlantic Avenue, Boston, will move to 326-330 Congress Street, about Dec. 1.

Chicago

CHICAGO, Nov. 12.—Total sales of machine tools so far in November are fully equal to the average in October, and dealers are of the opinion that this month will prove as satisfactory as any so far this year. Fresh inquiry bulks large and pending business is being closed with surprising degree of regularity. There is active demand for used machine tools and prices obtained are high, but the supply of desirable equipment of this kind is limited.

The St. Paul Railroad has ordered a new style 72-in. King mill. The J. I. Case Threshing Machine Co., Racine, Wis., and the Nash Motors Co. are studying requirements for plant additions.

Illinois Steel Co., South Chicago, Ill., will build a one-story extension to its electric power station, to cost \$175,000.

Federal Pipe & Supply Co., 900 South Campbell Avenue, Chicago, has purchased property for erection of a new building to cost \$250,000.

W. B. Wood and James M. Glenn, officers of Central Foundry Co., Marshalltown, Iowa, whose plant was destroyed by fire several months ago, head a syndicate which plans to erect new foundry, 110 x 125 ft., on site of former building.

Klondike Incubator Co., 2425 Dean Avenue, Des Moines, Iowa, has been reorganized to increase production and extend manufacture to include poultry supplies and sundries. Additional equipment and materials will be purchased later.

Frank Foundries Corporation, Moline, Ill., plans immediate enlargement by erection of two buildings on adjoining property, recently acquired, to cost \$100,000. One structure, 100 x 160 ft., will be known as East foundry and a second building 70 x 100 ft., which will house shipping department, will be equipped with electric lift trucks and other loading apparatus. A three-story building will be remodeled for maintenance department, workshop and storage. Construction contract has been let to Axel Carlson Co., Moline.

Dreis & Krump Mfg. Co., 7400 Loomis Street, Chicago, manufacturer of machinery and parts, has awarded general contract to Abell-Howe Co., 53 West Jackson Boulevard, for one and two-story addition, to cost about \$50,000 with equipment.

Sunbeam Aircraft Co., Missouri Theater Building, St. Louis, H. P. Mammen, president will soon begin construction of one-story airplane manufacturing plant at Cahokia, Ill., consisting of parts and assembling units, to cost about \$200,000 with equipment.

International Harvester Co. 606 South Michigan Avenue, Chicago, has asked bids on general contract for three-story plant unit at Great Falls, Mont., 125 x 325 ft., to cost about \$130,000 with equipment. W. D. Price is superintendent of construction, in charge.

Poor & Co., 80 East Jackson Boulevard, Chicago, manufacturers of railroad equipment and supplies, malleable castings, etc., are disposing of stock issue to total \$4,165,000, part of fund to be used for consolidation of several companies and for expansion. Company will take over P. & M. Co. Chicago, and its subsidiary, P. & M. Co., Ltd., Montreal; Maintenance Equipment Co. Chicago; Vermilion Malleable Iron Co, Hoopeston, Ill., and Canton Forge & Axle Co., Canton, Ohio. Fred A. Poor is president.

Studebaker Co. of Illinois, Inc., 2036 South Michigan Avenue, Chicago, is taking bids on general contract for two-story automobile service repair and sales building at Evanston, Ill., to cost about \$235,000 with equipment. Loewenberg & Loewenberg, 111 West Monroe Street, Chicago, are architects.

Board of Utility Commissioners 310 North Broadway, Rochester, Minn., has approved plans for extensions in municipal electric light and power plant to cost about \$30,000. H. N. Crawford, Dental Building, is architect.

Minneapolis Gas Light Co., 16 South Seventh Street, Minneapolis, Minn., is considering three-story meter building, with service and repair departments, to cost about \$75,000 with equipment.

Beuchner & Orth, Shubert Building, St. Paul, Minn., architects, will soon take bids on general contract for one-story automobile service, repair and garage building, to cost about \$115,000 with equipment.

Ovens, power equipment, conveying and other machinery will be installed in new one-story plant, 120 x 150 ft., to be built by Colonial Baking Co., 1500 Fifth Avenue East, Cedar Rapids, Iowa, to cost \$160,000 with equipment.

Cleveland

CLEVELAND, Nov. 12.—Machine-tool sales by dealers fell off some the past week, but single tool inquiry is holding up to recent volume, the bulk coming from the automotive field. No new inquiries of any size came out. Demand for turret lathes in single machines is holding up to recent good volume. The Industrial Rayon Co., Cleveland, which recently sent out a machine-tool list for its new plant at Covington, Va., has purchased three pipe machines for plant construction work. Not much activity is reported in the Detroit territory.

Plans are under way by Standard Electric Stove Co., Twelfth and Smith Streets, Toledo, Ohio, for one-story addition, totaling about 40,000 sq. ft. floor space, to cost more than \$85,000 with equipment. Company engineering department in charge.

Allen Sogg, 3030 Euclid Avenue, Cleveland, architect, has plans for three-story automobile service, repair and garage building, 80 x 130 ft., to cost about \$130,000 with equipment.

Libby-Owens Sheet Glass Co., Toledo, Ohio, is arranging for increase in capital from 400,000 to 1,000,000 shares of stock, no par value, considerable portion of proceeds to be used for expansion.

Defiance Screw Machine Products Co., Defiance, Ohio, has awarded general contract to Baker & Shindler, Defiance, for one-story addition, 40 x 100 ft., to cost about \$30,000 with equipment.

Alliance Aircraft Corporation, Alliance, Ohio, W. E. Trump, president, has awarded general contract to Alliance Structural Steel Co. for one-story airplane manufacturing works, including parts and assembling departments, 60 x 300 ft., to cost about \$50,000 with equipment.

White Sewing Machine Corporation, Main and Elm Streets, Cleveland, manufacturer of electrically operated sewing machines and parts, has arranged for a bond issue of \$2,500,000, a portion of proceeds to be used for expansion.

Max Weis, Union Building, Cleveland, architect, has plans for four-story auto-

mobile service, repair and garage building, to cost about \$110,000 with equipment.

City Council, Galion, Ohio, has authorized call for bids for extensions in municipal electric light and power plant, including additional equipment, for which fund of \$100,000 recently was authorized.

Cincinnati

CINCINNATI, Nov. 12.—Machine-tool bookings since the first of the month have been in somewhat lessened volume than in October, but nevertheless have held to a high level. That the automobile industry and companies supplying automobile parts continue actively to purchase equipment is indicated by the fact that among orders placed with local builders the past week were special high-production lathes, valued at \$50,000, by a Detroit company, five large lathes by an automobile maker in Michigan, five lathes by a company manufacturing automobile parts, and several lathes by a piston ring company. While fully 50 per cent of the business of some machine tool companies has originated in the automotive industry, others report a well diversified demand from all classes of buyers.

Agricultural implement and tractor manufacturers have bought small miscellaneous lots of equipment. Railroads are becoming more active participants in the market. The Chicago, Milwaukee, St. Paul & Pacific is reported to have contracted for several engine lathes and the New York Central has taken a single machine. Both the Louisville & Nashville and the New York Central are contemplating the purchase of engine lathes. Almost without exception, the machine-tool plants which are busy are those making high-production tools, whereas those devoted to building large standard machines, such as planers, are operating on lighter schedules. The outlook for the remainder of the year is regarded by local executives as favorable. While sales probably will not stay at the peak maintained in August, September and October, they should be of liberal volume. Incidentally, several local builders, in checking over their October performance, have found that bookings were the largest of any month since early in 1920.

Board of Trustees, Wilberforce University, Wilberforce, Ohio, is having plans drawn for one-story power plant at institution, 50 x 85 ft., to cost about \$60,000 with equipment. H. B. Briggs, Ohio Hartman Building, Columbus, is architect.

Fleischman Yeast Co., 419 Plum Street, Cincinnati, is considering construction of two-story automobile service, repair and garage building for company motor trucks and cars, to cost over \$80,000 with equipment.

Louis Block, an official of Donoff Brothers & Block, 115 South St. Clair Street, Dayton, Ohio, commission merchants, has purchased property at 441-447 West Fifth Street, as site for multi-story cold storage and refrigerating plant, 50 x 100 ft., to cost more than \$75,000 with equipment.

Dixie Mineral Products Co., Chattanooga, Tenn., W. H. Meachem, 1515 Duncan Avenue, president, will proceed with installation of clay mining and refining plant, to cost approximately \$75,000 including machinery.

Rainbow Light, Inc., Thirteenth Street,

Long Island City, N. Y., manufacturer of electric tube lighting apparatus, has purchased plant and business of Mercury Electric Sign Co., 1717 Magazine Street, Louisville. It is understood that branch factory will be operated at Louisville.

George D. Waller, Independent Life Building, Nashville, Tenn., architect, has revised plans for two-story automobile service repair and garage building, 100 x 150 ft., to cost about \$90,000 with equipment.

Kentucky Cement Corporation, recently organized by F. B. Drew, McAlester, Okla., and associates, has opened offices in Farmers' Bank Building, Frankfort, Ky., and will soon proceed with foundations for initial units for cement mill near Frankfort, to cost over \$2,000,000 with machinery. Hunt Engineering Co., New York Life Building, Kansas City, Mo., is engineer.

City Council, C. O. Sherrill, city manager City Hall, Cincinnati, is completing plans for municipal equipment storage and distributing plant, with automobile service, repair and garage building for city-owned cars, to cost about \$100,000.

City Council, Columbus, Ohio, has been authorized to arrange bond issue of \$850,000 to purchase tract of 1000 acres for establishment of municipal airport.

Pottage Tankage Corporation, East Water Street, Troy, Ohio, is considering rebuilding part of plant recently destroyed by fire.

South Atlantic

BALTIMORE, Nov. 12.—Rock Hall Marine Railway, Inc., Rock Hall, Md., recently organized by Ellsworth Leary, Rock Hall, and associates, is planning for local shipyard and boat-building plant. Property has been acquired on Chesapeake Bay waterfront. George Coleman and Andrew Stevens, both of Rock Hall, will be active in new company.

Ovens, power equipment, conveying and other machinery will be installed in new two-story plant to be constructed by General Baking Co., 420 Lexington Avenue, New York, at Washington, to cost \$200,000. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Twin City Boiler Works, Inc., Bristol, Va., is planning installation of additional equipment, including angle bending rolls, angle shear, etc.

Glenn L. Martin, 9717 Lake Shore Boulevard, Cleveland, head of Glenn L. Martin Co., manufacturer of aircraft, whose plant on St. Clair Avenue was acquired recently by Great Lakes Aircraft Corporation, is said to be concluding negotiations with City Council, Baltimore, for new airplane manufacturing plant in Dundalk section, where city has offered tract of 100 acres. Proposed to have hangars, construction and repair shops, and other units constructed by Baltimore Port Commission, and occupied by Martin company under long lease. Project is reported to cost more than \$450,000.

Simmons Co., Kenosha, Wis., manufacturer of metal bedsteads, springs, mattresses, etc., is reported considering new branch plant at Richmond, Va.

Superior Pine Products Co., Fargo, Ga., is considering installation of locomotive crane, steam or gasoline operated.

A. Weiskittel & Son Co., Twelfth and East Lombard Streets, Baltimore, manufacturer of stoves, ranges, etc., is said

to be planning a one-story addition, 80 x 110 ft., to cost about \$25,000 with equipment.

J. E. Sperry, Calvert Building, Baltimore, architect, has plans for six-story automobile service, repair and garage building, to cost about \$450,000 with equipment. H. E. Doeleman, 516 North Charles Street, is engineer.

Detroit

DETROIT, Nov. 12.—Plans are being prepared by Murray Corporation of America, Inc., 1424 Aberle Street, Detroit, manufacturer of automobile bodies, for a new six-story plant, to cost over \$175,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Packard Motor Car Co., 1580 East Grand Boulevard, Detroit, has plans for a two-story addition, 130 x 375 ft., to cost about \$150,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer.

General Foundry & Machine Co., Flint, Mich., has been organized to take over and consolidate General Foundries, Inc., Flint Foundry Co., and Flint Malleable Castings Co., all operating local plants. Foundries of the Flint Foundry Co., at Flint and Marshall, Mich., will be continued, while plants of two other noted units will be combined at present foundry of General Foundries, which will be extended for enlarged output. Consolidated company will have assets of about \$600,000; J. M. Barringer is president, and E. W. Atwood, treasurer.

Olds Motor Works, Lansing, Mich., has awarded general contract to Reniger Construction Co., 127 North Cedar Street, for two-story addition, to cost over \$50,000 with equipment.

Marshall Furnace Co., Marshall, Mich., has arranged for purchase of plant and business of Monitor Furnace Co., Cincinnati, which will be dismantled and removed to Marshall, where production will be increased and concentrated in future.

Jackson Motor Shaft Co., Tyson Street, Jackson, Mich., has awarded general contract to J. F. Braun, 414 South Gorham Street, for one-story addition, 50 x 275 ft., to cost about \$50,000 with equipment.

Ryerson & Haynes, Inc., 2307 East Ganson Street, Jackson, Mich., manufacturer of automotive assemblies, specializing in spark and throttle control mechanism, has recently taken over part of former Earl plant where it has increased facilities for broader lines of activity. Company was formerly known as O. C. Harrington Co., but has changed its name as Mr. Harrington is no longer connected with business.

Peerless Plating Plant, 522 Fort Street East, Detroit, has been organized to succeed Helmich Mfg. & Plating Co., and will operate general polishing and electroplating plant. Equipment has been purchased. Company plans further enlargement which may involve removal to larger factory.

Phoenix-Detroit Burner Corporation, 1917 First National Bank Building, Detroit, has been organized to manufacture heating equipment and supplies. Company has plant and equipment, but is in market for materials used in manufacture.

Lakey Foundry & Machine Co., Muskegon, Mich., manufacturer of engine castings, etc., for automotive industry, is carrying out an expansion program to cost about \$400,000. Additional equip-

ment will be installed to double present capacity.

Ajax Bolt & Screw Co., 6623 Gratiot Street, Detroit, is asking bids on general contract for rebuilding part of plant recently destroyed by fire.

Chromium Plating Corporation, Jackson, Mich., recently organized with capital of \$25,000, has taken over part of local plant of O. C. Harrington Co. for new plating works. George A. Barrow and Creighton Ryerson, both of Jackson, head new company.

Federal Mogul Corporation, 11031 Shoemaker Avenue, Detroit, manufacturer of metal bearings, is considering one-story addition, 120 x 175 ft., to cost about \$70,000 with equipment.

Board of Education, Ypsilanti, Mich., is considering installation of manual training equipment in addition to junior high school to cost \$700,000, for which plans will be drawn by R. S. Gerganoff, 206 North Washington Street, architect.

Detroit Edison Co., 1200 Second Boulevard, Detroit, is having plans drawn for new coal storage and distributing plant, to cost about \$400,000 with loading, conveying and other equipment. Engineering department of company is in charge.

Milwaukee

MILWAUKEE, Nov. 12.—With the national election out of the way, the machine-tool industry has settled down and expects that the good business which has prevailed for the past five or six months will continue for some time. Most plants experienced a demand in October equal to the September volume, and are so well provided with business that production schedules are being maintained at the high point of the year. Shortage of machinists, tool-makers and molders remains acute.

Walker Mfg. Co., Racine, Wis., manufacturer of lifting jacks, has started work on a one-story addition, 100 x 200 ft., total cost estimated at \$100,000.

Henszy De-Concentrator Co., Watertown, Wis., has been incorporated to manufacture a device used in connection with steam boilers to eliminate scale, corrosion, foaming and priming, invented and developed by R. O. Henszy, and in limited production for eight months. Device will continue to be built by Otto Biefeld Co., Watertown, but later new corporation intends to erect a plant. F. W. Goldsmith, 120 East Wisconsin Avenue, Milwaukee, is president and sales manager, and Arthur Kuenzi, 106 North Water Street, Watertown, is vice-president and production manager.

Esline Co., 610 Michigan Street, Milwaukee, manufacturer of portable cottages, garages and other sheet steel structures, has broken ground for a new plant, 150 x 175 ft., one-story, at Oconomowoc, Wis. Production until now has been concentrated at Barton, Wis., and this plant will be continued in operation. Present investment will be over \$65,000 including equipment.

E. R. Wagner Mfg. Co., Thirty-second Street and Adams Avenue, North Milwaukee, Wis., manufacturer of hardware specialties, stampings and plated ware, is building a two-story addition, 36 x 42 ft.

Village trustees, Whitefish Bay, suburb of Milwaukee, are preparing to ask bids for construction and equipment of a municipal garbage incinerating plant, for which a bond issue of \$55,000 has been authorized. T. H. Buckley is village engineer.

Zenith Mfg. Co., Racine, Wis., manufacturer of superpower cylinder head for Ford and Chevrolet passenger and commercial car engines, has acquired a site in North Milwaukee and expects to start work immediately on new plant. Arthur W. Sieglaff, president and general manager, has established general offices at Thirty-ninth Street and Villard Avenue, North Milwaukee.

Elmberg Co., Ladysmith, Wis., manufacturer of hardwood products, toys, etc., is starting work on two factory additions, 127 x 200 ft., and 34 x 90 ft., costing about \$75,000 with equipment.

McNally-Tollefson Foundry Co., Stoughton, Wis., is negotiating for purchase of plant it occupies and contemplates erection of two additions.

National Equipment Corporation, Milwaukee, has acquired Parsons Co., Newton, Iowa, manufacturer of power-trench excavators, and Insley Mfg. Co., Indianapolis, manufacturer of steel towers for hoisting and pouring concrete. Both companies will continue under present management as divisions of National Equipment Corporation. H. C. McCarell, president of Parsons Co., and W. H. Insley, president of Insley Manufacturing Co., become vice-presidents and directors of parent corporation.

Pittsburgh

PITTSBURGH, Nov. 12.—Bids will be asked at once by Whitaker Paper Co., 101 Ninth Street, Pittsburgh, for one-story storage and distributing plant, to cost about \$200,000 with handling and other equipment. R. Maurice Trimble, Commonwealth Annex, is architect.

Witherow Steel Corporation, Neville Island, Pittsburgh, manufacturer of automobile axles and other steel products under die-rolling process, is said to be planning additional unit, to cost about \$100,000 with machinery.

Pennsylvania Rubber & Supply Co., 2819 Prospect Avenue, Cleveland, is having plans drawn for new factory branch, storage and distributing plant at Oil City, Pa., one story, to cost about \$40,000 with equipment. George S. Rider Co., Century Building, Cleveland, is architect and engineer.

Monongahela-West Penn Public Service Co., Fairmont, W. Va., is planning construction of steel tower transmission line from Rivesville to Parkersburg, W. Va., and vicinity, about 90 miles, with 15,000-kw. power substation at latter place for industrial service, project to cost more than \$200,000.

Pillsbury Flour Mills, Inc., Minneapolis, Minn., is concluding negotiations for purchase of plant and business of Harvey Paper Co., Wellsburg, W. Va., manufacturer of heavy paper stocks. New owner plans expansion, with installation of new unit for production of bags and containers, to cost more than \$200,000 with machinery.

Robertshaw Mfg. Co., Youngwood, Pa., manufacturer of plumbing equipment, heat-regulating devices, etc., has awarded general contract to Austin Co., Pittsburgh, for one-story addition, 75 x 140 ft., to cost about \$35,000 with equipment.

J. F. Rodgers, 726 Oliver Building, Pittsburgh, has been appointed representative in that city for Pennsylvania Pump & Compressor Co., Easton, Pa., maker of air compressors, vacuum, centrifugal and air lift pumps.

Buffalo

BUFFALO, Nov. 12.—Plans are under consideration by Simmons Machine Tool Corporation, 86 Exchange Street, Buffalo, for one-story addition to cost more than \$30,000. Joseph M. O'Connell is manager.

Williams Gold Refining Co., 2978 Main Street, Buffalo, has acquired two-story plant of National Grinding Wheel Co., on adjoining site, for expansion. National company has work in progress on new plant at North Tonawanda, N. Y., to cost more than \$50,000 and will remove to that location for increased output.

Fitzgibbons Boiler Works, Inc., Oswego, N. Y., is said to have plans under way for one-story addition to cost about \$40,000, including equipment. A. G. Lockett is general manager.

Continental Can Co., Syracuse, N. Y., and 1 Pershing Square, New York, is having plans drawn for new two-story plant, 300 x 600 ft., at Los Angeles, to cost more than \$300,000 with equipment; crane runway will be installed. Francisco & Jacobus, 511 Fifth Avenue, New York, are architects and engineers. Continental company has acquired can-making plant and business of Hardesty Mfg. Co., Denver, Colo., which will be continued as new branch.

Commissioner of Public Works, Municipal Building, Buffalo, will receive bids until Nov. 21 for wire fencing and gates for Houghton Park.

Fire, Nov. 6, damaged portion of plant of Kast Copper & Sheet Iron Co., 91 Main Street, Buffalo. It will be rebuilt. Same fire also destroyed two blocks of industrial property, including warehouse and distributing plant of Detroit & Cleveland Navigation Co., and W. A. Case & Son Mfg. Co., 31 Main Street, manufacturer of sanitary ware, etc., both of which will be rebuilt.

Benedict Mfg. Co., East Syracuse, N. Y., is inquiring for a second-hand uniflow steam engine, either Nordberg or Skinner, 100-125 lb., 75 to 112½ kva.

St. Louis

ST. LOUIS, Nov. 12.—Bids are being asked by Board of Public Service, St. Louis, until Nov. 20, for one 10-ton electric, box girder, crane and hoist, for installation in fire department repair shop, contract 3472. O. D. Tillay is secretary.

Morrow-Kidder Mfg. Co., Carthage, Mo., has plans for addition to wood-working plant, to cost \$70,000 with equipment.

Board of Works, Tulsa, Okla., plans call for bids early in December for complete purification plant for municipal waterworks, with rating of 24-million gal. per day. Black & Veatch, Mutual Building, Kansas City, Mo., are engineers.

Robertson Aircraft Corporation, St. Louis, care of McDonald & Condie, 502 North Taylor Street, architects, has awarded general contract to J. S. Alberici, Boatmen's Bank Building, for airplane plant at Lambert-St. Louis Field, Anglum, consisting of hangar, 100 x 120 ft., repair shop and other units, to cost more than \$85,000.

Standard Steel Works, Inc., Sixteenth and Howell Streets, North Kansas City, Mo., is completing plans for one-story addition for storage and distributing service, to cost about \$25,000. I. L. Bornstein is company architect.

Wall-Ragalsky Elevator Co., McPherson,

son, Kan., will soon take bids for new grain elevator with capacity of 150,000 bu., including conveying, screening and other equipment, to cost about \$50,000. Horner & Wyatt, Board of Trade Building, Kansas City, Mo., are consulting engineers.

Everhart Rubber Co., Grand Island, Neb., Merrill Lewis, president, has leased building to be erected at Third and Elm Streets, one story, 130 x 132 ft., for new plant, to cost about \$80,000 with equipment.

Board of Education, Excelsior Springs, Mo., is said to be planning installation of manual training equipment in new two-story high school to cost about \$200,000, for which plans will be drawn by Saylor & Payson, Interstate Building, Kansas City, Mo.

Little Rock Refining Co., Little Rock, Ark., recently formed by C. N. Faubel, 4101 Woodlawn Street, and associates, with capital of \$250,000, is planning construction of oil refinery near city, to handle 1000 bbl. crude oil daily. E. L. Warden, 2124 East Third Street, is also interested in company.

Midwest Chandelier Co., 1403 Chestnut Street, North Kansas City, Mo., has work under way on one-story and basement plant, 115 x 135 ft., to cost over \$75,000 with equipment. Victor J. DeFoe, 114 West Tenth Street, is architect.

Board of Education, North Little Rock School District, Little Rock, Ark., plans installation of manual training equipment in five-story and basement high school to cost \$400,000, for which bids will be asked on revised plans at once. Mann, Wanger & King, New Donaghey Building, are architects.

Gulf States

BIRMINGHAM, Nov. 12.—Plans have been approved by Wyatt Metal & Boiler Works, Dallas, Tex., for new one-story branch plant at Houston, Tex., totaling 75,000 sq. ft. floor space, for steel fabricating and heavy plate work for oil refinery products, to cost over \$100,000.

City Council, Coleman, Tex., plans extensions and improvements in municipal electric light and power plant, including 750-kw. engine-generator and auxiliary equipment.

Board of Education, Houston Independent School District, Houston, Tex., is said to be planning installation of manual training equipment in addition to Jefferson Davis senior high school, to cost over \$175,000, for which bids have been asked on general contract. Hedrick & Gottlieb, Post-Dispatch Building, are architects.

Louisville & Nashville Railroad Co., Louisville, has awarded general contract to H. Horace Williams Co., 821 Howard Street, New Orleans, for new shops at Mobile, Ala., to cost over \$500,000 with equipment. W. H. Courteney is chief engineer.

National Portland Cement Co., Houston, Tex., recently organized with capital of \$250,000, has succeeded to plant and business of Gates Chemical Co., Mary and North San Jacinto Streets, and will convert plant for production of special white cement. H. J. Harris, 4425 Normandy Street, is president.

Richardson Refining Co., Big Springs, Tex., has begun work on new oil refinery for handling 5000 bbl. crude oil per day, to cost \$550,000 with machinery.

City Council, St. Petersburg, Fla., has authorized construction of municipal airport, to be known as Albert Whitted

airport, including hangar, repair shop and other buildings, entire project to cost \$85,000. James Luchini, city engineer, is in charge.

Sears, Roebuck & Co., Arthington Avenue and Homan Street, Chicago, has acquired tract of 3½ acres at Houston, Tex., for new eight-story storage, distributing and sales building, to cost about \$1,000,000 with equipment.

General Motors Corporation, Detroit, has plans for new two-story service, repair and sales building at New Orleans, to cost about \$100,000 with equipment. Bids will be asked in about 30 days. Albert Kahn, Marquette Building, Detroit, is architect and engineer.

Buick Motor Co., Flint, Mich., has begun construction of three-story factory branch, storage and distributing plant at Dallas, Tex., to cost over \$400,000 with equipment. Coburn & Fowler, Dallas, are architects.

Common Council, Mer Rouge, La., is planning early purchase of 50,000-gal. steel tank and tower for municipal water system.

Missouri-Kansas-Texas Railroad Co., St. Louis, has awarded general contract to T. H. Johnson, 522 North Texas Street, Dallas, Tex., for new locomotive repair shops at Smithville, Tex., comprising one-story machine shop, 80 x 84 ft., and other units, to cost about \$125,000 with equipment. A. L. Sparks, Railway Exchange Building, is company architect.

Louisiana Public Utilities Co., Lafayette, La., has plans for rebuilding local electric generating station and ice plant recently destroyed by fire. Gannett, Seelye & Fleming, Inc., 600 North Second Street, Harrisburg, Pa., is engineer, in charge.

Kelley Stove & Range Co., Leeds, Ala., has been formed to manufacture stoves, ranges and heaters for Southern trade.

Indiana

INDIANAPOLIS, Nov. 12.—Bids have been asked on general contract by John Deere Plow Co., 216 South Senate Avenue, Indianapolis, for a four-story factory branch and distributing plant at Fort Wayne, to cost about \$125,000 with equipment. O. A. Eckerman is company architect at main plant, Moline, Ill.

J. D. Adams & Co., 217 South Belmont Avenue, Indianapolis, manufacturers of road building machinery, have awarded general contract to Hall Construction Co., Board of Trade Building, for one-story addition, 110 x 175 ft., to cost about \$50,000 with equipment.

Board of Directors, Indiana Soldiers and Sailors Orphans' Home, Knightstown, is considering new power plant at institution to cost more than \$150,000 with equipment. L. A. Cortner is superintendent.

Public School Extension Association, Central High School Building, Muncie, A. H. Kruse, president, is completing construction of one-story and basement vocational school, 200 x 200 ft., to cost \$150,000, and plans early installation of equipment. Houck & Smenner, 108 East Washington Street, are architects.

Chrysler Motor Corporation, Detroit, is planning construction of one-story machine shop at motor truck plant at Evansville, to cost about \$250,000 with equipment. Other units are also contemplated.

Truck Engineering Co., East Pontiac Street, Fort Wayne, has awarded general contract to Buesching & Hagerman Co.,

402 East Superior Street, for one-story addition at motor truck manufacturing plant. Guy Mahurin, Standard Building, is architect.

Indiana General Service Co., Muncie, plans construction of steel tower transmission line to Anderson, Ind., with power substation for industrial plant service at last-noted place, entire project reported to cost more than \$500,000.

Gary Screen & Door Co., 1041 Jefferson Street, Gary, has been organized to manufacture screen doors and windows, storm doors, storm sash and combination doors. Plant is fully equipped with machinery, but company is in market for lumber, hardware and wire.

Pacific Coast

SAN FRANCISCO, Nov. 8.—Plans are being drawn by Boiler, Tank & Pipe Co., 4061 Hollis Street, Piedmont, Cal., for new one-story boiler and plate shop on 3-acre site at East Oakland, to cost approximately \$65,000 with equipment. A crane runway 60 ft. wide and 350 ft. long will be installed.

Krumm Mfg. Co., Mentone, Cal., manufacturer of commercial fertilizers, is planning extensions and improvements in mill to cost about \$150,000, including equipment.

United Concrete Pipe & Tile Co., Chamber of Commerce Building, Los Angeles, has purchased tract of 15 acres at Torrance, near present plant, and is contemplating new works to cost over \$100,000 with equipment.

Pacific Public Service Co., Santa Cruz, Cal., operating Coast Counties Gas & Electric Co., is disposing of note issue of \$3,400,000, part of proceeds to be used for extensions and improvements, including transmission lines.

School District of Multnomah County, Administration Building, Portland, is said to be planning installation of manual training equipment in new Clinton Kelly high school to cost \$750,000, for which bids are being asked on general contract. George H. Jones, address noted, is architect.

Boeing Airplane & Transport Corporation, Seattle, recently organized to take over Boeing Airplane Co. and Boeing Air Transport Co., is disposing of a stock issue to total \$5,310,000, a considerable part of proceeds to be used for expansion. Company will develop increased plant facilities for production of aircraft for military and commercial service, as well as heavy tri-motor planes for transcontinental air service.

Municipal Light Department, Seattle, has plans for municipal hydroelectric power plant at Reflector Bar, near Diablo dam, to more than double present output of city-owned stations. Work will be carried out as part of Skagit River hydroelectric power development, to cost about \$3,000,000 with transmission lines. W. D. Barkhuff is city engineer, in charge.

Los Angeles Period Furniture Mfg. Co., 1300 East Jefferson Street, Los Angeles, has plans for two additions, two stories, 40 x 130 ft., and one story, 40 x 134 ft., to cost about \$45,000 with equipment. Feenstra & Son, 3920 Avalon Boulevard, are architects.

Board of Education, Los Angeles, has authorized plans for addition to Bell high school, including one-story vocational shop unit, to cost about \$105,000 with equipment. Train & Cressey, Western Mutual Life Building, are architects.

Henry Disston & Sons, Inc., Philadelphia, will establish a factory at Sixteenth and Irving Streets, Portland, Ore., to enlarge its service in Northwest. Manufacturing and repairing saws, knives, files and other products will be carried on. Operations will begin about Jan. 1.

Canada

TORONTO, Nov. 12.—Machine tool sales of a diversified nature continue in good volume. Large railroad equipment orders have been placed recently and the automotive industry continues a leading factor in tool purchases with considerable business in prospect for early closing. Mining equipment is moving in large volume. Stronger demand is reported for wood-working tools. Small tools are active.

Hinde & Dauch Co., Ltd., Toronto, has taken out a permit for erection of a factory to cost \$250,000. Company manufactures corrugated paper, boxes, etc.

Massey-Harris Co., Toronto, has applied for a permit for erection of an addition to cost \$60,000.

Anaconda American Brass, Ltd., New Toronto, plans a construction program extending over a three-year period in connection with plant recently acquired.

William I. Bishop, Ltd., Montreal, has been awarded general contract for construction of a hydroelectric power development plant on Lievre River for James MacLaren Co., Buckingham, Que., and will start construction work soon.

Hull Iron & Steel Foundries, Ltd., Hull, Que., will build an addition to its plant to cost \$250,000. A. H. Coplan, 7 Clemor Avenue, Ottawa, Ont., is general manager.

Dominion Steel Foundries, Ltd., Hamilton, Ont., has awarded contract to Poag & Kemp, Ltd., Westinghouse Avenue, for alterations and extensions to plating mill, to cost \$10,000.

Canada Wire & Iron Goods, Ltd., 180 King William Street, Hamilton, Ont., will start work immediately on an addition to its plant.

Ritchie Cut Stone Co., Ltd., 191 Grant Street, Hamilton, Ont., has awarded contract to Mitchell & Riddell, 46 Head Street, Hamilton, for a factory and office building at New Toronto, to cost \$200,000.

Sangamo Electric Co. of Canada, Ltd., 183 George Street, Toronto, has awarded contract to R. G. Kirby, 539 Yonge Street, for two-story addition, 40 x 110 ft., to its plant, to cost \$40,000. Chapman & Oxley, Northern Ontario Building, are architects.

Mundet Cork & Insulation, Ltd., 51 St. Lawrence Street, Toronto, has awarded contract to H. A. Wickett Co., Ltd., 156 Front Street East, for one- and two-story factory, 100 x 150 ft. H. G. Macklin, Triller Avenue, is architect.

Bids are being received by M. L. Dyke, town clerk, Bling River, Ont., until Nov. 21, for one 1200-Imperial gal. per min. engine-driven fire pump with accessories. Frederick A. Dallyn & Co., 71 King Street West, Toronto, is consulting engineer.

Western Canada

East Kootenay Power Co., East Trail, B. C., contemplates building a 15,000-hp. hydroelectric plant at Phillips Canyon, on Elk River.

West Kootenay Power Co., subsidiary of Consolidated Mining & Smelting Co., Trail, B. C., will soon begin construction

of a power plant to cost \$4,000,000 and to develop 80,000 hp.

Vancouver Kraft Co., Ltd., Vancouver, B. C., will start work immediately on a \$2,000,000 pulp and paper plant at Port Mellon, about 20 miles from Vancouver, to cost \$2,000,000. Company also will build a lumber mill with capacity of 200,000 ft. per day.

Canadian National Railways have awarded contract to Hamilton Construction Co., Regina, Sask., for additions to machine erecting shops, at Winnipeg, Man.

Foreign

PROGRAM is being arranged by Moscow Department of Public Works, Moscow, Russia, for extensions and improvements in municipal utilities to cost \$126,000,000 over a five-year period. Of this fund, about \$35,000,000 will be used for waterworks, about \$15,000,000 for transit system, \$22,000,000 for sewage systems, \$875,000 for municipal gas works. Other expenditures will be made for slaughter houses, cold storage plants and miscellaneous projects. Amtorg Trading Corporation, 165 Broadway, New York, official buying agency for Soviet Russian Government, has information regarding project.

Department of Government Railways, Wellington, New Zealand, will receive bids until Jan. 9, 1929, for pneumatic

tools, as per Specification 270, on file at office noted.

United Dutch-Indian & German Glass Factories, Sourabaya, East Java, Netherland East Indies, recently formed with capital of 6,000,000 florins (about \$2,500,000), has plans for construction of glass manufacturing plant, to cost considerable part of capitalization.

Radio Corporation of America, Woolworth Building, New York, has closed contract with Nanking Government, Shanghai, China, for construction of local high power radio station for world-wide service, to cost \$170,000; completion is scheduled in 12 months.

Civil Bureau of Aeronautics, Mexico City, Mexico, is planning construction of municipal airport near present Valbuena military field, to include hangars, repair and reconditioning shops and other mechanical units. Government has granted permission.

South Durham Steel & Iron Co., Ltd., South Durham, England, is concluding arrangements for acquisition of Cargo Fleet Iron Co., Ltd., London, and will consolidate under first-noted name. Combined company will have capital of £1,650,000 (\$8,250,000), and plans expansion.

Ercole Marelli Electric Mfg. Co. (Ercole Marelli & C., Societa Anonima), Milan, Italy, manufacturer of generators, motors, fans and other electrical machinery, is disposing of bond issue of \$2,500,000 in United States, part of fund to be used for extensions.

New Trade Publications

Tumbling, Washing and Burnishing Metal Parts.—Ideal Industrial Machinery Co., Winton Place, Cincinnati. Well illustrated booklet of 32 pages showing installations of equipment for a considerable variety of uses, mainly in connection with metal parts in process of manufacture. The machinery is almost all of the rotary type, much of it being automatic in its application.

Copper-Alloy Steel Sheets.—Inland Steel Co., Chicago. An illustrated booklet on Inland copper-alloy steel sheets, which includes data on results of tests conducted by a committee of the American Society for Testing Materials.

Steel Factory and Office Equipment.—Angle Steel Stool Co., Plainwell, Mich. Illustrated catalog of 112 pages giving complete information on stock-built items of factory and office equipment made of steel. Steel shelving, cabinets, stools and trucks are among prominent lines of manufacture.

Flash Butt-Welders.—Federal Machine & Welder Co., Warren, Ohio. Bulletins 80 and 82 describe machines for making rings of bent bars, for wheel rims, brake bands, felloes and the like. The smaller will make 500 wheel rims per hour of 4 1/2 by 5/32-in. steel. The larger size has a capacity of 200 per hour working on 6 1/4 by 3/16-in. irregular steel bar having an area of 1.6 sq. in.

Unit Heaters.—American Blower Corporation, Detroit. Bulletin 7418 of 32 pages and cover illustrates and describes the Sirocco unit heater, made in both the vertical floor type and the horizontal ceiling type. The standard heating element is of staggered copper tubes. Tubes of steel will be furnished if required. A considerable amount of data will be found in the bulletin.

Industrial Portable Lighting Equipment.—Bart Mfg. Co., 6001 South Talman Avenue, Chicago. Booklet of 16 small pages illustrating and describing a number of patented devices for lighting equipment adapted to workshop use.

Fittings for Overhead Track.—Hoist & Crane Engineering Co., 114 Liberty Street, New York. Loose-leaf sheets, eight pages, illustrating and briefly describing conductor supports, insulators and clamps, strain insulators and other fittings, for overhead material-handling tracks.

Monorail Conveying Systems.—Reading Chain & Block Corporation, Reading, Pa. Catalog 56 of 60 pages illustrates and describes overhead conveying systems, including rails and supports, switches and various types of carriers to run on the rail, featuring chains and electric hoists, etc. Drawings show clearances and other dimensions.

Factory Forms.—McCaskey Register Co., Alliance, Ohio. Folder carrying a variety of forms for factory use, most of which are of the multiplying type, with carbon on the back of each form except the last. The forms are in a multiplicity of arrangements, which are mainly suggestive.

Cold-Drawn and Miscellaneous Steel Products.—Moltrup Steel Products Co., Beaver Falls, Pa. Catalog No. 2 of 100 pages describes a wide variety of sections of steels produced by the company, including a number of alloy steels embodying nickel, chromium and vanadium, either singly or in combinations. The catalog illustrates many sections, not only of rolled and drawn material but of special shapes, such as machine keys and the like, giving list prices and specifications. Steel gear racks form a feature.

THE IRON AGE

New York, November 22, 1928

ESTABLISHED 1855

VOL. 122, No. 21

Repairing Locomotives on Schedule

How the "Spot" System of Operation Is Applied
at Readville—Definite Program
and Control Employed

ADVANCING of units in process of assembly in such manner that their speed of movement serves to maintain a proper supply of work waiting at each operating station has long been standard practice in many plants. But the application of this system, or one patterned upon it, to repairing of such complex organisms as locomotives has not made the same measure of progress. This is largely because of the wide dissimilarity between the work required to be done upon one locomotive and that which the next one demands. For this reason the methods now in vogue at the railroad shops at Readville, Mass., will prove of special interest.

Many schemes have been evolved to reduce the average number of shop hours per locomotive necessary to complete the work of general overhauling upon this important unit of railroad machinery. Among the latest of them is the "spot" system recently adopted by several large roads. This system contemplates establishment of a schedule, covering a stated period in advance, to list the individual engines to be overhauled, show the dates upon which they are to be delivered to the shop by the transportation department, indicate the nature and extent of the work to be done upon them and the approximate number of hours which will be required to complete it, and to allot to each engine a definite space in the yard and shop where it may be found upon any given date as the work progresses.

To carry out successfully the details of the system close cooperation among the heads of all mechanical subdivisions is essential. To secure this cooperation meetings of these

officials are arranged at stated intervals—usually once a month—at which meetings the future known requirements of each subdivision in the way of locomotive repair are discussed, the nature and approximate amount of work to be done upon each engine is decided upon and the order of precedence is determined. From the data thus provided the advance schedule is prepared.

Work Apportioned Months Ahead

Advance schedules prepared and approved at each monthly meeting of the mechanical executives cover five months; one month being stricken from the list (assuming that all work for the period is completed) and a new month added. At the same time, any minor changes which may be made necessary by the exigencies of

road service are noted in the duplicated four-months and the schedule is corrected for the entire period.

The locomotive shop is operated 16 hr. daily, with two gangs, the second shift force being much smaller than the first, thus providing sufficient flexibility to smooth out any irregularities that may occur by reason of emergency jobs or of repairs which may require more than the estimated time to complete, and to maintain an even rate of production according to schedule. At the same time, the knowledge that every engine is scheduled for delivery on a certain date is an incentive to the men to get their parts of the work done within the allotted time.

Survey of the advance schedule, a copy of which is in the hands of all executives responsible for production, shows not only the serial numbers of the engines to be

overhauled during the ensuing five months, and the date of delivery, but indicates what new parts, if any, are to be provided, as well as the time and place where they must be delivered to meet the specific engine at a given location as it progresses through the shop.

Elaboration of the schedule in the form of a work sheet is made up daily and delivered each morning to all foremen, so that every one may know just what repairs and replacements must be delivered to specific locations throughout the shop at specified times.

Numbered distribution tracks in the yard receive the locomotives, as they are delivered from the various subdivisions of the road, in their order of precedence. Engines are immediately dumped, boilers drained, tenders detached and dummy couplers applied to the rear drawbar pockets, so that the locomotives may be coupled at either end to a switching engine for transference. The tenders are placed upon the coal track, where the coal and water remaining in

may have been disclosed by the removal of dirt and grease in the sand-blasting operation.

Method of Progression Used

Application of the spot system in the locomotive shop may be seen in Fig. 1, which is a partial diagram of the floor in that part of the building usually called the "erecting" shop; in this case shorn of its regular designation by the fact that the assembly, or "erection," is progressive, and the engine remains in one place for but a limited time. Engines enter from the right.

The space in this part of the shop is divided into four sections, lettered A, B, C and D respectively, but separated only by painted posts and lines. Section A is devoted to heavy repairs, including frames, cylinder replacements and major boiler repairs. In this section are six "spots," or positions, numbered 1 to 6, inclusive, to which engines are delivered, minus their wheels, from the adjacent unwheel-

them may be taken out, and they are then headed in upon a track leading to the tender repair shop.

Upon the day scheduled for work to begin, usually the day of receipt or the day following—the selected engine is set off upon a track leading to the stripping sheds. Here it is carefully gone over by inspectors, who mark it with chalked hieroglyphics, intelligible to railroad men, according to the nature and extent of the repairs to be made. It is then moved forward to the stripping sheds to be dismantled.

By having the work of stripping done in a separate building, adjacent to the cleaning house, much of the dirt and grease incident to a long period of road service is kept out of the locomotive shop and one of the disagreeable features of locomotive repair thereby eliminated. Work in the stripping sheds includes the removal of such boiler and firebox parts as are known to need renewal, but does not involve unwheeling.

The stripped parts are conveyed in baskets or individually, according to their size and weight, to the potash vats in the nearby cleaning house, and from thence distributed—clean and free from grease—to the several repair departments of the locomotive shop. The engine itself goes forward upon its own wheels, still on the same track to another building wherein the cylinders, all remaining running gear, the smoke arch and the interior of the boiler are cleaned by sand-blasting. Upon issuing from the sand-blast house the engine is again inspected for possible defects that

ing pits. Here they remain from three to eight days, in accordance with the amount of work to be done upon them. There are no tracks in sections A, B or C, the engines being moved when necessary by the overhead cranes.

Section B also provides six positions, arranged somewhat differently to allow more working space around the engines, and numbered 7 to 12, inclusive. Here are conducted some of the lighter operations upon boilers, frames and cylinders. Engines may remain in this section from three to six days. When the work upon any engine in section A or section B has advanced to a point from which it can be completed in four days, it is advanced to spot 13 or 17 in section C for the remainder of the work.

In section C, unlike sections A and B, the engines are moved forward from one position to the next each calendar day. As there are in this section two lines of four positions each, upon which two engines are undergoing the same stage of repair coincidentally, this means that no given engine may remain in the section for a longer period than four days, and that two engines are transferred to section D every day. All moves are made at the beginning of the night shift, by a gang of men specially trained to this job.

Section C is supplied with engines from section A or section B, the work upon which has advanced to within four days of completion; or direct from the unwheeling pits, with engines which require not longer than four days to make the entire repair.

The first move each night is to run two engines from

spots 25 and 26, section *D*—now upon their own wheels—cut into the yard to be taken to the finishing shed. The switching engine handles this job. Engines upon spots 23 and 24 are advanced to the vacated places and those upon spots 21 and 22 are moved forward correspondingly. This move leaves spots 21 and 22 uncovered, and upon them is immediately assembled the running gear of the engines occupying spots 16 and 20 of section *C*.

Engines upon spots 16 and 20 are now lifted by the cranes and deposited upon their wheels on spots 21 and 22; those upon spots 15 and 19 are advanced to 16 and 20, respectively, and all other engines in section *C* are moved forward correspondingly to leave spots 13 and 17 uncovered for the reception of engines from the preceding sections or from the unwheeling pits, as previously noted.

Engines Unwheeled Before Entering

Two unwheeling pits are located immediately to the right of section *A*, at the entering end of the shop. To them two engines are delivered each day from the track leading from the sand-blast house. A gang of men starts at once upon the work of preparing them to be lifted from their wheels, so that, by the time the moves within the several sections have been made, these two engines are ready to be deposited in the finally vacated positions, which may be in any one of the three sections, according to the nature of the repairs to be made upon the incoming locomotives.

The two engines hauled away from positions 25 and 26, section *D*, are coaled and watered in the yard, after which the switching engine takes them to the finishing shed, Fig. 2, for minor adjustments preparatory to road service. Here they are fired, and for the first time move under their own power. As in the locomotive shop, they advance progressively from one position to another, and in the final position they are spray painted.

An outstanding advantage claimed for the progressive assembly method as applied to locomotive repair is that each part of the work is performed in a definite place. The several parts repair departments of the shop may be located adjacent to the positions where the parts are to be applied to the engine, and thus much long-distance trucking is avoided. Operations requiring steam, air, gas or water can be performed close to the source of supply and the promiscuous distribution of these commodities by long lines of hose, with attendant difficulties when such lines of hose are inadvertently cut, is forestalled.

Portable tools and their accessories are always at hand when needed; never at the other end of a shop a quarter of a mile long. Last, but by no means least, each job is handled by gangs of men who are trained to that job, who are not widely separated, and who have all the appliances necessary to their respective trades ready to their hands.

All newly overhauled engines are given a running test of about two hours' duration over what is called a "slip" track in the yard. The track is about half a mile in length and has a pronounced hump about midway of its length. The rails of the track are well greased, and this condition is maintained by allowing grease to drip from two small tanks secured temporarily to the pilot of the engine under test.

An engine starting from either end of this track is faced with a considerable grade, up which it climbs quite slowly, though the machinery may be running at a rate of 50 or more miles an hour. Passing over the hump, the engine is reversed and the locomotive slides slowly down the descending grade, often with its wheels running at equal speed in reverse direction.

This manner of testing allows the inspectors to ride upon exposed parts, or even to walk beside a locomotive which is running at normal road speed, yet advancing so slowly that they may observe clearly the action of the machinery under the equivalent of actual road conditions.

Visual Record in Superintendent's Office

To enable the general superintendent of shops to keep in close touch with the work in progress, the board shown in Fig. 3 is affixed to the wall of his office, in a position where it may readily be observed from his desk. Round tags, each bearing the number of an engine in the shops or yards, are hung upon convenient hooks on the board, to show where each engine may be found.

Rapid progression of the work involves the shifting of these tags from one position to another every day, as the engine itself moves through the shops. As all the moving is done at night, it becomes an easy matter for the official having the work in direct charge to change the tags each morning to correspond with the actual moves already made. The superintendent is thus prepared at a glance to answer any question that may come in from the various divisions of the road as to the progress of work upon any given engine, and the date upon which that engine may be delivered to service.

Beautifying a Factory Entrance in Illinois

THE entrance to the plant of the Whiting Corporation, Harvey, Ill., was recently awarded the second prize in a contest conducted by the "Illinois Journal of Commerce" to determine the most attractive factory dooryard in the State. The competition was carried on in an effort to arouse interest in better factory surroundings

Anti-Trust Law Repeal Unnecessary

Trade Commission, Under Broader Interpretation of Its Powers, Can Help Industries Stamp out Competitive Excesses

BY ABRAM F. MYERS*

A CHARGE frequently hurled at the anti-trust laws is that they make competition a fetish; that competition has been exalted over all considerations of economy and efficiency. These flights are, for the most part, purely rhetorical. The competition that the anti-trust laws would preserve is not the jungle competition that the critics of those laws imagine. The anti-trust laws recognize that not all competition is good, and that unrestrained competition is bad. They have been as often invoked for excesses of competition as for the suppression of competition.

The test of the legality of a corporate combination is not the amount of inter-company competition that is suppressed, but whether the competition it affords is fair or oppressive. And the Federal Trade Commission Act has for its main purpose the prevention of unfair methods of competition in interstate trade and commerce.

Sees Wider Field of Usefulness for Commission

It is on the proper interpretation of the words "unfair methods of competition" that the ultimate reconciliation of the proper needs and aspirations of business with the law depends. The commission has, and was intended to have, a wider field of usefulness than the mere prosecution of individuals and concerns for the use of unfair competition. Also it is clear that the language of the statute is not to be limited to common law definitions. It is the formula whereunder the commission may and does cooperate with industry, through the trade practice conference procedure, in writing codes of ethics that are bringing about that degree of proper and desirable stabilization compatible with American institutions and ideals. In this way the commission is making good the prediction of the late Senator Cummins in a speech in the Senate on Sept. 7, 1914:

I predict that in the days to come the Federal Trade Commission and its enforcement of the section with regard to unfair competition will be found an anchor for honest business. I believe it will introduce a stability in business that hitherto has been unknown. I believe it will restore confidence among those who are conducting their affairs honestly and uprightly. I believe it will be found to be the most efficient protection to the people of the United States that Congress has ever given the people by way of a regulation of commerce, and that it will rank in future years with the anti-trust law; and I was about to say that it would be found still more efficient in the creation of a code of business ethics and the establishment of the proper sentiments with regard to business morals.

How Commission Enforces Ethical Codes

A trade practice conference is authorized by the commission on the application of a substantial part of an industry, usually made through their trade association. The industry is thereby enabled to write its own code of ethical and economic practice, subject to approval or rejection by the commission in the public interest.

Resolutions aimed at practices illegal per se are placed

in Group I, and the commission undertakes to enforce compliance therewith by proceeding against all violators, whether they have subscribed thereto or not, under Section 5 of the Trade Commission Act. Resolutions placed in Group II are aimed at practices that have not heretofore been held unlawful by the commission or the courts. The secret violation of such a resolution by one who has openly subscribed thereto, and has led his competitors to believe that he will observe it, will result in a proceeding by the commission on the ground that such secret violation is in and of itself an unfair method of competition.

Thus these codes for the strengthening and uplifting of American industry are made enforceable in every particular save one. The commission has not yet undertaken to enforce resolutions of the character included in Group II against a recalcitrant minority who will not subscribe thereto.

The absence of means for the enforcement of Group II resolutions against non-subscribers has proved a serious stumbling block to the efforts of many industries at self-regulation. Thus the manufacturers of knit underwear at a recent conference declined to adopt resolutions fixing standards for the wool content of "part wool" garments because they could not be assured of protection against the competition of the low-content manufacturers. Thus a grave question is presented as to whether codes of ethics for American business are to be written by a progressive majority, or by a reactionary minority. For it often happens that a recalcitrant 15 or even 10 per cent of an industry, seeking and obtaining a competitive advantage by persisting in practices which the majority have proscribed, eventually brings all down to its level, and in this way praiseworthy efforts to elevate the standards of an entire industry may be defeated. In this fashion the minority effectively imposes its will upon the majority.

Commission Cannot Originate Code

The remedy for this, if any there be, lies in the gradual expansion of the commission's powers under existing law, rather than in new legislation. It is doubtful if the building up of a new code of business practice will lend itself to Congressional definition. Certainly any attempt by Congress to decree by law that the minority in an industry shall conform to the wishes of the majority in respect to practices never heretofore regarded as unlawful would meet with determined opposition and would give rise to grave questions of constitutional right. In any such proposal provision would have to be made for an umpire to guard the minority against oppression and the public against extortion.

The courts at a time when the Federal Trade Commission was regarded as a none-too-constructive agency gave to the words "unfair methods of competition" a somewhat narrow interpretation. They held that the words did not apply to practices not characterized by fraud, deceit, bad faith or oppression, or which did not tend to restraint of trade or monopoly. But this definition was given in cases

*Federal Trade Commissioner. From address before American Institute of Steel Construction at Biloxi, Miss., Nov. 15.

in which the commission had attempted to apply the law to practices of which it did not approve, without regard to legal precedent and contrary to the customs and usages of trade. The courts put an end to the notion that the commission could evolve out of its inner consciousness a business code with the binding effect of law, and by way of emphasis went further than was necessary to achieve their purpose.

Code Should Be Sponsored by Clear Majority of Industry

What of a code of fair trade practices for each industry, written by the overwhelming majority thereof, with the Federal Trade Commission as arbiter? The language of the statute is not like a crystal, fixed and unchangeable; it is applicable and has been applied to many practices not specifically in the minds of the lawmakers when the act was passed. The question is simply one as to the extent to which the customs and needs of the preponderant part of an industry may be taken into account by the commission and the courts in deciding what are, and what are not, unfair methods of competition. No case involving a practice formally condemned by a clear majority of the industry involved has been presented to the courts together with the fact of such condemnation.

Approached from this angle the element of coercion is greatly minimized and the grave constitutional questions largely disappear. It is not a case of galvanizing the will of the majority into law. The needs and customs of the majority are merely taken into account in applying the law now on the statute books. The plan contemplates an administrative and (if sought in individual cases) a judicial weighing of the relative merits and advantages of the proposals of all interests concerned. It further contemplates the rejection of any and all measures that would work undue hardship on any member or branch of the industry in question, or on the public. And it is founded on the conception that the minority has no greater right to impose its will on the majority and on the public, by standing in the way of important reforms in the public interest, than the majority has to impose its will on the minority by insistence on measures that would unduly prejudice the rights of such minority.

Outlawing Practices Admittedly Unlawful

On the question whether the experiment is worth making let us consider the possibilities of the procedure as indicated by more than 40 successful trade practice conferences already held. In the beginning the conferences were largely confined to outlawing practices admittedly unlawful. It is not to be inferred, however, that these conferences had no constructive value. They had the effect greatly to elevate the standard of ethics in the industries involved; to protect honest manufacturers and dealers against the unfair competition of their unscrupulous rivals; and to restore and increase public confidence in such industries. Certainly no one can question the benefit to all concerned from the wholesale elimination of such pernicious practices as short weights and measures, false advertising and misbranding.

Believing that the establishing of standards of quality in commodities was the greatest single reform that could be accomplished for the protection of the public, the commission widened the scope of its conferences to include content and quality definitions of furs, "Castile" soap, engraving and embossing, gold-filled watch cases, rayon, furniture, woven furniture, rebuilt typewriters, plate glass and hickory handles. The hickory handle conference is significant in its bearing on the future usefulness of the trade practice conference procedure, in that the standards of quality adopted at the conferences were those which had previously been worked out by representatives of the industry in cooperation with the division of simplified practice of the Department of Commerce. In other words, the subscribers

to the conference rules availed themselves of this means of translating the beneficent results of the helpful cooperation of the Department of Commerce into a binding agreement.

Scope of Trade Practice Conferences Broadening

In the past year the conferences have been even more constructive from the standpoint of the industries affected. Resolutions have been adopted providing for the publication of prices realized in actual transactions; condemning price discrimination in the language of Section 2 of the Clayton Act; declaring against the payment or allowance to buyers of commissions, bonuses, rebates or allowances of any kind; against the rendering of unusual services or the assumption of unusual charges without charging the customer therefor; against discrimination in price resulting from the allowance of quantity discounts on split shipments; against selling goods below cost; and against the dumping of considerable quantities of goods in territories outside of the subscriber's particular markets and selling such goods at prices below those prevailing in his own territory.

This brief review of recent accomplishments seems also to me to reflect the current trends of thought in Government and in industry. So far as possible the adjustment of the aspirations and needs of business with the law will be accomplished through conference and cooperation. Competition is to be preserved and the undue concentration of economic power avoided by encouraging and approving that degree of cooperation between independent businesses which will enable them to survive the competitive struggle and remain independent. Waste is to be eliminated and the public protected by the establishment of standards of grade and quality. And the extremes of overproduction and underproduction are to be avoided, and stability of employment promoted, by encouraging the dissemination and intelligent use of the essential facts of industry.

Firm Price Policy to Be Encouraged

Care in the pricing of products and the avoidance of secret departures from prices openly established will be favored to the end that industry may not be plunged into price wars to their impoverishment and demoralization. As in the past, the use of approved methods of cost accounting will be urged. The adoption of and adherence to a firm price policy will be encouraged. Such a policy is in keeping with Section 2 of the Clayton Act and is justified on other grounds as well. The products of one industry are the raw materials of another, and discrimination between competing concerns in the matter of prices on necessary materials, not based on differences in quality or quantity, will in the end give rise to the very evils that it is the purpose of the anti-trust laws to prevent.

At this stage we might well inquire what scope would be left to competitive effort under such a policy? What protection is afforded the public, and what becomes of the highly developed professional purchasing agent? I firmly believe that under such a system competition would continue to be the great regulator of our domestic economy. There would be no decrease, but a marked increase, in the steady march of progress. The struggle for greater efficiency, for the elimination of waste and for fixing standards of quality would continue with renewed vigor. Prices would be fixed not in concert, or by agreement, but by each industrial unit acting singly, and they would reflect the relative efficiency and individual policy of each concern. The striving for improvement in the quality of output would be unhampered by the temptation or need to lower standards in an effort to realize a profit in a chaotic market.

Rationalization Program Requires No Trust Law Tinkering

Under such a system the professional buyer would find ample opportunity for the legitimate employment of his talents. He could still shop for the lowest prices and the

best quality. But the lying buyer would be effectively stopped, because the price quoted him in each instance would be the best that the bidder could offer, having due regard to the situation in his company and the prosperity of his industry, and would not be shaved to meet supposedly lower prices by competitors which actually existed only in the imagination of the buyer.

With the prospect of such a policy of rationalization under enlightened leadership in industry and an administration committed to cooperation and engineering efficiency, what is to be gained by trust law tinkering at this time? That peculiar conditions in the coal and oil industries call for special attention is admitted. As a member of the committee of nine of the Oil Conservation Board I joined in a recommendation for a modification of the anti-trust laws to meet the peculiar needs of the oil industry, and that recommendation has been indorsed by the American Bar Association. Section 7 of the Clayton Act exists as a nuisance

law in that it is wholly ineffective to prevent mergers and only makes them more troublesome and expensive. But a proposal to repeal that provision might encounter as much sentiment in favor of preventing mergers as in allowing them, and no one can predict what the outcome would be. That there should be some rationalization of the law with respect to the maintenance of resale prices on competitive trade-marked goods is attested by the hopeless confusion into which this subject has been plunged by the conflicting and inconclusive decisions of the courts.

With these exceptions I can see no good end that can be served by the repeal or a general modification of the anti-trust laws. I do not believe that the country will ever abandon free and open competition as the keystone of its economic policy. An enlightened administrative policy will enable us to retain all the benefits of competition and to eliminate all that is bad. That the realization of these ideals is possible is attested by the accomplishments to date.

Central Welding Shop Leads to Economies

Modest Equipment and Resourceful Workmen Available for Repair,
Construction or Production in All Metals

BY T. C. FETHERSTON*

IT is frequently found that in plants which have had a cutting and welding outfit for a long time no clear idea is had of the maximum usefulness of the oxy-acetylene process. Thus a sheet metal company might purchase equipment to oxweld a particular lot of tanks and fail to realize, when a brake frame cracks, that there is already

Conditions of this sort are not conducive to true economy because all available resources are not being utilized. But, on the other hand, it would seldom pay to employ a man solely to look for places to use the cutting and welding blowpipes. The best procedure is to let new applications come to light naturally.

This is done quite readily by establishing a central welding department or shop. It is not necessary that all oxy-acetylene operations be carried on in a special building, but rather that they be organized and assigned definite headquarters. Then if the machine shop wants a foot treadle repaired there is a place to take it. Or if the men tearing down old equipment want some steel work cut away there is a definite place where they can locate a "cutter" with the necessary equipment.

A central welding shop accomplishes several things: Operators know where to find apparatus; shop foremen know where to go to have cutting and welding jobs done; a shop warrants a welding foreman of more than ordinary ability; and executives have a means of keeping welding costs.

When one considers the number of jobs and diversity of work which can be done by such a department it can readily be appreciated that the shop need never be without work of some kind, even though it is quite modest in size and equipment. If there is no production work, the operators can always reduce the plant's scrap pile either by reclaiming material or by cutting up worthless junk. A well managed central welding shop will prove a real boon to any plant. It can be a self-contained unit, always busy and always assisting in cutting down operating expenses.

Development of the use of steel as a building material for bridges is dealt with in a 20-page booklet just issued by the American Institute of Steel Construction, Inc., 285 Madison Avenue, New York, entitled "Endurance and Beauty in Steel Bridges," by Charles Evan Fowler, consulting engineer. The booklet traces the uses of iron and steel in bridges from the last quarter of the eighteenth century down to the present time and discusses the advantages of the various types of steel spans now being constructed.

A Good Welding Shop Without Elaborate Equipment. At right is oxy-acetylene equipment on a hand truck; another set is at the welding table in center; on wall is welding rod rack and at left is lime bin for annealing castings. In foreground is a variety of work done on steel, iron and alloys

on hand a means of speedy and economical repair. Again, a manufacturing plant might buy an outfit solely for repair work, never realizing that the welders could take an important place in direct production. Or a company might use its outfits for both repair and production work without thinking that they could also be used to install pipe lines, or to cut up scrap.

French Industry Active, Wages Low

High Output Contrasts with Lagging Production and Continued Unemployment in Britain—Buying Power of French Workman Small

BY EDWIN C. ECKEL*

PARIS, FRANCE, Oct. 25.—It has been necessary to spend the past two months in northern and northwestern France, mostly in mining and manufacturing districts, so that it has been possible to get at least a rough idea as to wages, living costs and other industrial conditions in France at the present time. An incidental stay of a week in England has furnished certain data and impressions that I am using here as convenient contrasts to French conditions. I say "contrasts," because as a matter of fact there are far more points of difference than of agreement in the present industrial and economic status of the two countries. Among the main points on which considerable differences now exist are wage scales, living costs, unemployment, tax and tariff policies, labor views, manufacturing costs and export possibilities. It will be seen that some of these are likely to touch our own interests rather closely.

French Industrial Output at New Peak

As offering perhaps the best general guide to the present status of French industry, the following official indexes of production, using 1913 as a base of 100, are of interest. From the entire mass of data available I have selected certain critical years and dates, and certain important industries.

Indexes of French Industrial Production, 1919 to 1928

Year	General Aver.	Metal-lurgy	Textiles	Auto-mobiles	Building	Paper	Leather	Rubber
1919	57	29	60	..	16	51	102	305
1920	62	41	66	..	27	65	88	233
1921	55	41	52	..	23	50	75	230
1922	78	61	84	..	37	60	94	359
1923	88	68	83	..	58	80	103	416
1924	108	94	85	..	74	77	110	538
1925	107	101	85	..	80	83	104	502
1926	124	113	94	..	102	90	128	599
1927	109	112	90	..	72	83	103	547
1928 (Jan.)	116	118	100	..	68	75	118	555
1928 (Mar.)	123	125	102	624	79	..	..	538
1928 (Aug.)	128	126	100	670	98	..	..	595

The table brings out very strikingly the two main facts as to the French industrial situation: First, that French industry regained its old levels very slowly, reaching on the average its 1913-1914 productivity not until 10 years later (1923-1924); that it then rose rather rapidly to a new high point in 1926; and after a notable but short relapse in early 1927 has now, in the latter part of 1928, reached an entirely new peak, even higher than its 1926 maximum. Second, that this advance is very irregular as between trades; the automobile and rubber factories show phenomenal gains over pre-war years, while the paper, textile and building trades are either worse off than 15 years ago or not above their 1913-1914 status.

As compared with this great increase in French industrial production we may note that, though the United States shows an even greater gain (155 in 1928 as against a base of 100 in 1913), Great Britain has never been able to regain its pre-war level, the British indexes standing at:

1913.....	100
1925.....	87
1926.....	67
1927.....	96
1928 (Feb.)	93.4

*Mining geologist, 1503 Decatur Street, Washington.

The sequel to this is, of course, that there is this year practically no unemployment anywhere in France, while there is a good deal of forced idleness in Great Britain. What struck me most in London, perhaps, was that there were able-bodied men begging on the streets—something that I don't recall having seen in Paris at any time in the last 10 years. Recalling that the British Government is pretty well committed to a permanent policy of pay for the unemployed, it is clear that the economic conditions there are at the moment less favorable than those in France.

For those who are fully employed, English wages are, of course, far higher than French, class for class, though also far lower than American. French wages are, as a matter of fact, pretty miserable, and do not in any case leave a reasonable margin of buying power for the laborer, above his strict necessities. And that fact reacts finally on the profits of the French manufacturer and shop-keeper, for you cannot expect to make much money in selling goods to poorly paid workmen. We all talk prettily at times about the French genius for economy; but there is nothing pleasant about a wage scale that does not permit anything but economy.

So far I have not been able to find any official data on French average wages—except for the coal miners, which I shall discuss later. But in my visits to various mine and mill centers I have put together the results of talks with managers and miners, and the general result is as follows:

The immediate Paris region is a region of relatively high pay for skilled mechanics, owing probably to the boom in motorcar and related industries. A skilled workman in a Paris factory or mill may make 5 to 6 fr. (20 to 24c.) an hour. On the usual 8-hr. Paris day his daily pay may therefore run from \$1.60 to \$1.92. But this is a very exceptional rate of pay for France, and its occurrence in a few favored industries in the Paris region does not affect the national average very seriously.

In mining regions and in the smaller industrial towns the pay of a miner, quarryman, mason, carpenter or other skilled worker does not ordinarily run above 4 fr. an hour at the best, and in some places averages nearer 3 or 3½ fr. an hour. At several large mine and quarry operations which I visited lately, employing together a good many thousand men, the average daily pay did not in any case rise above 24 fr.—say 95c. a day. In the Lorraine iron region it is higher—around \$1.28 a day for miners. In the north French coal mines exceptionally detailed and reliable figures happen to be available. These show that the underground miner averages from \$1.20 to \$1.28 daily in the three important Northern fields, while the surface worker in the same fields averages from \$1 to \$1.04 per day worked. Since some of the south French fields are on even lower pay scales, the final result is that the average French miner, underground and surface, in all French fields, received \$1.13 per day in 1926 and around \$1.24 last year.

In the mines I have seen, the piece-work scales are set so low that they rarely permit the piece-worker to earn

more than a common laborer on hourly pay—a condition that does not encourage the men to take over jobs on that basis. So one incentive to increased output is entirely lacking.

French Workers Have Limited Buying Power

Taking all the data into consideration, it seems probable that the French output of iron ore, coal, pig iron, steel and steel products, cement, clay products and all other heavy products is being made today on a wage scale that certainly

does not average over \$1.20 per day and more likely averages not much over \$1 daily. And, as I shall try to show later, a dollar does not go very far, even in France, in the way of buying food, clothing and shelter. As for the other things that our people have come to look upon as almost necessities, they are of course entirely out of the question. If Mr. Ford should try to market his car at \$100 in France, I do not think there are a hundred skilled laborers here who could afford to buy one.

Locomotive Frames Cast on Edge

New Method of Molding These Large Steel Castings Found to Give Notable Results—Mold Made Entirely of Cores

FOR many years the conventional method of molding locomotive engine frames was "on the flat" through the use of a one-piece pattern and a long two-piece built-up flask. The molds therefore were long, unwieldy, quite difficult to handle and were likely to warp during the mold drying operations, unless every precaution was taken to prevent this.

Although engine frames molded by the method just mentioned are usually cast flat, a few attempts have been made during the past few years to cast them on edge, with varying success. The accompanying illustrations show the method used by the American Steel Foundries at its Chester, Pa., foundry in molding frames so that they may be successfully cast on edge.

Steel Form Instead of Flask

Replacing the flask is a machined steel form shown in one of the illustrations upon which cores forming the mold are placed in an upright position. The form itself is a substantial affair in a fixed or permanent location, being solidly bolted to a concrete foundation.

The sand portion of the mold consists of two sets

of dry sand cores in section. The back sections, the first placed in the form, contain the impression. The front sections are usually straight faced slab or cover cores. When all cores have been carefully put in place, they are backed up with heavy steel plates rigidly clamped into position which prevent any movement during the pouring operation. The bare form and method of clamping is shown in another illustration.

Cores Do Not Require Long Drying

The box from which cores are made is the usual rectangular wood affair, with a section of the pattern formerly used for flask molding built in for the impression. The cores, which are rammed on a jarring machine or sand slinger, are of such size that they are readily handled and do not require the lengthy drying ovens necessary for flask molded frames.

The form method of molding not only permits edge pouring of the casting, but also allows the placing of the gate and risers at such points as to assist best in accomplishing the desired results, symbolized in the third illustration—a solid casting.

Tool Steels of the Chemical Analyses Shown Have Given Excellent Service

BY E. E. THUM

IN view of the fact that there are about 675 tool steel brands offered to American users by some 60 firms, the puzzled buyer may at times wonder which one is best for his purpose. If he wishes to judge by chemical composition, his problem is simplified somewhat. The adjoining table represents good practice—that is to say, fine steels

of the composition listed, when properly formed and heat treated, will give excellent service for the class of work indicated. It should be remembered, however, that there is one important ingredient in all tool steels which does not appear in the regular chemical analysis, and that is the craftsmanship of the steel maker.

Chemical Analyses of Excellent American Tool Steels

Plain Carbon Steels:	Carbon	Silicon	Manganese	Chromium	Tungsten	Vanadium
Sledges and hammers.....	0.60 to 0.70	0.25 to 0.30	0.25 to 0.35	All alloy metals (except perhaps vanadium) should be excluded

IN the Upper Picture One-Half of a Locomotive Engine Frame Mold, Using Built-Up Dry Sand Core Sections, Is Shown, So Arranged That the Frame May Be Cast on Edge. The central illustration shows the mold form with clamps and tie bars used to fasten in place the dry sand core sections which comprise the mold. The lower illustration reveals the final casting with gate and risers as it appears when removed from the built-up core section

Mills to Cooperate with Fabricators

Program Outlined at Biloxi Meeting to Increase Markets and Stabilize Structural Steel Business

DEFINITE accomplishments in the form of a better understanding of the mutual problems affecting structural steel fabricators and the rolling mills of the country came out of the sixth annual convention of the American Institute of Steel Construction, Inc., which was held at the Edgewater Gulf Hotel, near Biloxi, Miss., Nov. 13 to 17. A partial report of this meeting appeared in *THE IRON AGE* of Nov. 15, page 1235.

Representatives of steel producers, on the one hand, expressed appreciation of the constructive work being

markets and protect the present high measure of prosperity.

The necessity for the structural steel industry to sponsor a comprehensive national advertising program to inculcate a "steel consciousness" in the minds of the architect, the engineer and the builder also was stressed.

Outstanding on the program was the annual banquet at which Charles M. Schwab, president of the American Iron and Steel Institute; Right Honorable Arthur Meighen, former premier of Canada; and Lieutenant-Commander C. E. Rosendahl, commanding officer of the United States airship *Los Angeles*, were the speakers.

Assessments Increased to Pay for Promotion Work

That the members of the institute are desirous of expanding its promotion work was indicated by the agreement at the final session to increase the tonnage assessment of the members for the coming year so that the organization can assume full financial responsibility for its corps of district engineers. With the increased revenue accruing from this arrangement, it is probable that the number of district engineers will be increased from 10 to 14.

Mr. Schwab, in his address, stated that no plant of his would be allowed to compete with independent steel fabricators and that differences between the rolling mills and the fabricators should be settled by mutual cooperation. He reiterated his opinion that the major problem of the steel industry is to distribute its products

more intelligently and that in order to do this the so-called anti-trust laws should be amended to permit of wider latitude in achieving the desired results. He declared that a one-price policy, if generally adopted by steel mills, would go far toward stabilizing conditions in the industry.

The foremost problem confronting those engaged in the development of airships is the creation of mechanical facilities for handling craft on the ground, said Lieutenant-Commander Rosendahl. The storage of helium gas in underground cylinders and in tank cars, as well as the construction of

Charles N. Fitts, New England Structural Steel Co., Boston, New President

W. M. Wood, Mississippi Valley Structural Steel Co., Retiring President

done by the fabricators through the medium of the institute and voiced their desire to cooperate for the benefit of the industry as a whole. The fabricators, on the other hand, declared their satisfaction with the growing willingness of the rolling mills to assist in carrying on a program designed to increase markets and to stabilize conditions within the structural steel business.

Pertinent to this program was the declaration of Abram F. Myers, member of the Federal Trade Commission, Washington, that the Federal Government looks with favor on cooperative effort within an industry to bring about sounder economic conditions and that the anti-trust laws in nowise restrain cooperative action in that direction, provided that suppression of competition is not the motive. He advocated the extension of the powers of the commission to effect a "rationalization" of prices which will stabilize

F. H. Frankland, Now in Charge of the Technical Service of the Institute

hangars and of mooring masts, involves the use of steel.

Rolling Mills Urged to Cooperate

That the rolling mills as a group should cooperate with the institute in carrying a reasonable portion of its budget and that there is much in the present situation to encourage the belief that ultimately such assistance will be given was the opinion expressed by President W. M. Wood, Mississippi Valley Structural Steel Co., Decatur, Ill., in his annual report. Mr. Wood discussed the relations of the fabricators with the mills, with the public and with their competitors, in the latter case pointing out that the joint activities of the members in the interest of a common cause have done much to break down old prejudices.

Mr. Wood further set down some of the factors which will bring profits to individual fabricators. He urged the

adoption of a cost accounting system and stated that unless an organization has a policy of adding a profit to its determined cost when submitting a bid it has no hope of success. He said that sales efficiency should be studied and developed far beyond the custom of most fabricating plants today and that a serious effort should be exerted to bring about a sane adjustment of supply to demand. Mr. Wood suggested that each fabricator make a comparison of his plant capacity with the tonnage which can reasonably be expected to come out of the territory in which he can operate most economically and then adjust his policies to conform to the situation. Some fabricators, finding their capacity greater than the business which they can reasonably obtain, have endeavored to improve their own position by reducing prices, thereby hoping to increase sales. However, the result has been that little, if any, more work has been obtained and, in addition, the jobs which would have shown a fair profit have been taken at a loss.

Declaring that fabricators should avoid scattering their sales effort, Mr. Wood proposed that they should develop a definite selling program and consistently adhere to it. In connection with this program each fabricator should make a careful study of the nature of the work which he can handle profitably, as well as of the classes and types of customers he can best serve. In concluding his report, Mr. Wood stated that the greatest need within the industry is sane and constructive leadership.

Uniform, Stable Prices Desired

CULTIVATION of friendly relationships with rolling mills, especially with those having fabricating departments, was recommended to the association members by the mills relations committee, of which H. A. Fitch, Kansas City Structural Steel Co., Kansas City, Kan., is chairman. This can be accomplished by each fabricator operating within his own province and having respect and consideration for the province of others. The committee stated that "this is not a mere theory. It has the elements of a practical and immediate solution of the rather unsatisfactory competitive condition now existing in the industry."

Independent fabricators should recognize the logical existence of the present fabricating departments of rolling mills, while the rolling mills, on the other hand, should recognize the necessity and value of the independent fabricating plants as an important medium for the distribution of their products and therefore should foster and protect them in that capacity.

So far as stable prices for plain material are concerned, the committee expressed the belief that "a uniform and stable price on rolling mill products applicable to all projects and all fabricators alike, with certain logical differentials, would be a potent factor in enabling our industry to stabilize the price of its product."

Since any fabricator with a reason-

able assurance of uniform operation at a fair uniform profit would be willing to maintain his plant at 60 to 70 per cent of normal capacity, the committee urged the members of the association to establish as a cardinal principle this thought: "Uniformity not volume, coupled with a constant concern for the uniform operation of your competitor's plant as well as your own."

Says Associations Should Combine for Publicity and Research

SPEAKING of the significance of local trade associations in the steel industry, Dr. Frank Parker, executive director of the Structural Steel Board of Trade of Philadelphia, declared that the local structural steel board of trade can improve the internal relations existing between local fabricators and can facilitate, expand and intensify the work of the institute in preparing and developing adequate printed publicity by aiding, through personal contacts previously established, district field engineers in every phase of their work and by creating new contacts for the institute, enabling it to extend the different phases of its national program.

Admitting that the problems of steel mills differ from those of the fabricators, Dr. Parker stated that nevertheless the essential economies which might be realized from a combination of trade association activities should be considered. He pointed out that more efficient results per dollar of expenditure for publicity and research could be achieved in the iron and steel industry by having the program of the various associations devised and controlled by a central administrative staff. To insist that the existence of individualistic problems automatically estops united effort can hardly be regarded as following the rule of rea-

son. Dr. Parker said that "in dealing with this aspect of trade association work what is needed is an unbiased attitude of mind in order that the merits and demerits of this suggested program may be given a fair hearing. The need for this impartial pondering of the facts becomes more evident when the history of the inauguration of some of our trade associations is scanned."

Dr. Parker expressed the opinion that the movement toward consolidations in business enterprises may tend to check further expansion of trade associations, but, on the other hand, individual enterprises banded together in existing associations may, by cooperative effort, put the association movement on a sound and permanent economic basis.

F. H. Frankland, in charge of the technical service of the institute, outlined the activities of the institute's field engineers, pointing out the valuable educational work they are doing to arouse a "steel consciousness" on the part of the public, of the engineering and architectural professions and of the building industry. However, he said that the district engineers are of the opinion that this task cannot be accomplished without the assistance of a comprehensive advertising and publicity campaign to acquaint the public with the merits of structural steel. Incidentally, it has been possible to trace to the district engineers the decisions of builders to construct steel structures requiring 43,250 tons of steel.

Technical Research Committee Studies Welded Joints

THE work of the committee on technical research has been confined to cooperation with the structural steel welding committee of the American Bureau of Welding, which was organ-

W. M. Wood, Retiring President of the Institute, Using a "Steel Carpenter," Which Makes It Possible to Cut a Steel Beam With a Blow Torch

ized to obtain reliable information upon which could be based safe unit working stresses in designing welded structures, stated Aubrey Weymouth, chairman, in his report to the convention. The committee studied all available literature giving the results of tests on welded joints from which unit working values could be deduced. To secure further data which would represent standardized conditions and which would give unit values applicable to the types of joint, thicknesses of material and sizes of weld most commonly encountered in structural steel work, a program was prepared covering 57 forms of joint in 191

tion, and each of these organizations will be asked to contribute by April 1, 1929, an amount similar to that donated in the past year to carry on the committee's work. The committee recommended that the institute appropriate its share of the money for this purpose.

Measuring Wind Strains on Steel Columns

A proposed investigation of measuring strains on the steel columns of the 48-story tower building of the American Insurance Union at Columbus, Ohio, was reported by the committee on wind bracing, of which

Charles M. Schwab, Who Was the Principal Speaker at the Banquet, Also Played Golf at the Institute Convention. This foursome (left to right) was J. L. Kimbrough, Indiana Bridge Co., Muncie, Ind.; Mr. Schwab; Right Honorable Arthur Meighen, former premier of Canada, and C. M. Denise, McClintic-Marshall Co., Pittsburgh

sizes welded by the arc and gas processes. Specimens were of the elemental type and embraced fillet welds of lap and tee form, end and butt welds and special joints. Single and double lines of weld, normal parallel and diagonal to the direction of the stress, continuous and intermittent, were specified.

Commercial Uniformity

To determine what degree of uniformity may be expected in commercial practice, multiple specimens of each type and size were scheduled and are now being prepared by about 36 representative fabricating shops of the United States and Canada. Operations will be governed by uniform procedure and inspection regulations. An important part of the program will be the keeping of records as to the sufficiency of these regulations. Because of the magnitude of the undertaking, it was decided to give the proposed program a preliminary trial. A series of pilot tests has been made by Prof. Peter Gillespie of the University of Toronto, these tests having involved the preparation and testing of 342 specimens. The results of the tests will be embodied in Professor Gillespie's report soon to be published.

The committee has received funds from the institute, the International Acetylene Association and the National Electrical Manufacturers Association,

Aubrey Weymouth is chairman. The committee was created by the board of directors in March, 1928, as a result of a paper presented at the 1927 convention by Prof. Clyde T. Morris of Ohio State University, and the institute has established a fellowship in structural engineering at Ohio State University for the college year 1928-1929. The investigation is being made by a fellow under the supervision of Professor Morris.

Structural Steel Hangars Are Declared Most Satisfactory

Airports to be self-supporting or to make a profit must be operated by as few efficient mechanics as possible, said Maj. Frank M. Kennedy, Air Corps, United States Army, in discussing flying fields. Every foot of space saved in moving a plane reduces handling costs and therefore a hangar 110 ft. wide, 20 ft. high and 120 ft. long is the most economical. These dimensions conform to the established ratio between width and height, determined by the fact that planes are four and one-half to five times wider than they are high. Major Kennedy stated that hangars of the structural steel type have proved to be the most satisfactory. He predicted that in the near future modern airports, so far as the housing and repair of privately owned planes are concerned, will be operated like an efficient downtown city garage.

A resolution authorizing the preparation of a standard form for contract proposals and its adoption by members of the institute was unanimously approved.

Better Bridge Designs Proposed

J. Horace McFarland, chairman of the Art Commission of Pennsylvania, admonished the members of the American Institute of Steel Construction to build more beautiful bridges. "The delightful flexibility of the material you use," he said, "the ease with which steel and cast iron may be combined in effective ways, will suggest to you and to those with whom you will associate yourselves forms not always on the same old pattern, but running into new lines of beauty no less efficient, no more expensive, but infinitely more sightly and therefore more satisfactory."

Definite steps to improve the design of steel bridges were recommended in a report of the committee on the aesthetic design of steel bridges, of which Clyde MacCornack, Phoenix Bridge Co., Phoenixville, Pa., was chairman. The committee recommended that an annual award be made to that bridge constructed during the year which would be chosen by a selected art jury as the most artistic in treatment. The bridge would be decorated with a plaque and complete engineering and architectural descriptions be published. In addition, the committee recommended that a report be compiled upon bridge design illustrated with some of the best examples extant, that the institute collect literature on artistic bridge design and that the problems of aesthetics in bridges be treated in lectures, etc.

Supplementing this work, it was proposed that a series of cash prizes be established to go to students in engineering and architecture, and others to practicing engineers and architects, for the best competitive bridge designs.

Charles N. Fitts New President

Charles N. Fitts, New England Structural Co., Boston, was elected president. Other new officers are C. M. Denise, McClintic-Marshall Co., Pittsburgh, first vice-president; Clyde MacCornack, Phoenix Bridge Co., Phoenixville, Pa., second vice-president; George Pistor, Hay Foundry & Iron Works, New York, treasurer; L. L. Gadd, Levering & Garrigues Co., New York, assistant treasurer. J. E. Miller, Bellefontaine Bridge & Steel Co., Bellefontaine, Ohio, was named a director to succeed C. A. Schneider, General Iron Works Co., Cincinnati, while the following members of the board of directors were reelected: W. M. Wood; A. J. Dyer, Nashville Bridge Co., Nashville, Tenn.; Clyde MacCornack; G. E. Klingelhofer, Pittsburgh Bridge & Iron Works, Pittsburgh; and James T. Whitehead, Whitehead & Kales Co., Detroit.

The members decided to return to the Edgewater Gulf Hotel for their convention in 1929.

Managers Turn to Research

Necessary for Budgeting Industrial Activities, for Appraisal of Market Trends
and to Develop New Lines—Profit Sharing for Executives

RESEARCH and profit sharing by executives were two major topics considered by the American Management Association, meeting in Chicago, Nov. 12 to 16.

Research was defined broadly as any study, by Ralph H. Heberling, supervising engineer Business Research Corporation. Studies of this kind, however, require too much concentration and time for the manager to spare. He should therefore delegate them to an open-minded investigator who is competent to gather all the facts and analyze them. The conclusions are presented to the manager to act upon.

"Job analysis" falls within such a definition. Job analysis is the source of job specifications, which are as necessary for the employment department as are steel specifications to the purchasing agent. Mr. Heberling emphasized that thorough research is an essential preliminary to a satisfactory budget (defining "budget" broadly as a plan of what reasonably can be expected of an organization and of the ensuing profits). To construct such a budget requires a knowledge of the expected demand for the material produced, the capacity of the firm to supply that demand, and the revenue aspects of the transaction. Obviously research is necessary to determine the trend in the market and the causes thereof. Job analysis and equipment schedules are necessary to appraise the capacity of the organization to produce and sell. With such facts at hand the comptroller can make a reasonable forecast of costs, income, and profits.

It was pointed out in discussion that Mr. Heberling's program in its entirety would involve an immense amount of work, and that the manager's function would be to direct the research into those channels which would reveal pertinent facts on the most vital points. It was also mentioned that the principal difficulty a research director would find would be in the obstructive attitude of minor executives, who feel that research exists merely to criticize the existing order, rather than to help everyone do his job better and easier.

Edward P. Curtis, Eastman Kodak Co., Rochester, N. Y., emphasized the necessity of constant study to appraise the present and future market, since two million new people are added to the buying public yearly, and these youngsters are the ones who most eagerly adopt the novelties. This new purchasing power constitutes a threat to a stabilized product, and at

the same time the opportunity for a radical innovation in merchandise.

C. F. Hansen, director of research, W. T. Grant Co., New York, outlined how he is able to predict the profits of new chain stores to within 5 per cent. It is done by minute analysis of purchasing, advertising and sales costs, and comparing the various items for all stores grouped in various ways as to location, population, size, management, etc. New stores have their sales budgeted by the counterfoot according to his company's experience for that type of store, community, management and size, also giving due weight to related data from the trade association, and economic data about industrial conditions throughout the country generally.

Information from trade associations could be of great aid to such researches for budget making, in the opinion of Ernest F. DuBrul, general manager, National Machine Tool Builders' Association, Cincinnati. Unfortunately, too few of the members know the essential facts, and of those who do, many refuse to divulge them to the association. A complete statistical service by a trade association could be made into a most valuable measuring stick for the whole industry if these impediments could be surmounted.

Research Which Pays

A DISTINCTION between research (systematic creative work along older scientific lines) and development (study of management, sales and production) was made by Dr. Z. C. Dickinson, Department of Economics, University of Michigan, Ann Arbor, Mich. At present, however, no one seems to know how large a percentage of the gross receipts should be devoted to such work. It is even debatable whether such investigations should be done in a centralized independent group (as is most scientific research) or decentralized in the various departments (as is most developmental and analytical work). Dr. Dickinson doubted that research is a separate function, any more than labor control is, since all departments have both with them constantly. Nevertheless he seemed to lean toward the view that research and development should be under one head, just as the labor policy is ordinarily in the hands of one man.

That these organization plans would vary from company to company was indicated by C. S. Redding, vice-president, Leeds & Northrup Co., Philadelphia. This plant has a shop engineer-

ing department responsible to the factory superintendent which intensely studies manufacturing processes, one by one. It has returned a profit since the month it was organized. The "research department," which studies the scientific aspects of the product and develops new designs, was in existence seven years before it accumulated a credit balance from royalties on the discoveries. In these early years the cost of this work was 10 per cent of the annual sales, but this proportion has declined to about 3 per cent where it has remained for the last 10 years, even though the total research expenditures are constantly increasing. Since the imposing balance now to the credit of research is due principally to discoveries of the early years, it is evident that recent expenditures have not been large enough, or have been misdirected. In Mr. Redding's opinion, as much money should be spent on research to develop new products as the sales department is able to capitalize upon.

Profit Sharing for Executives

AN analysis of 65 profit sharing plans has been made by Dr. C. C. Balderston, assistant professor of industry, University of Pennsylvania, Philadelphia. He believes the general plan has been successful, for only four of the 65 concerns have abandoned the plan in five years. In all these plans only the executives participate in profit sharing, and the portion of net profits to be distributed is published a year in advance. Those who are eligible for a share are also notified at the beginning of the year, but the share is seldom fixed until the time of distribution. In about half the plans this share is related to the salary received; about as many others attempt to base it on estimated performance. Three quarters of the plans pay in cash; the rest are quite sure that payment in company stock is far preferable. In Dr. Balderston's opinion, honesty of purpose is of more importance than the method of administration. Such an aim will avoid many difficulties in selecting the list of participants and in apportioning the shares.

Profit sharing draws forth full efforts from executives, in the opinion of Dr. Ralph E. Heilman, dean School of Commerce, Northwestern University, Chicago, and therefore is a good managerial device. However, his observations show that it works best for the high men in small organizations, because in such circumstances the

greater responsibility gives a greater and more visible influence on profits and a better understanding of business vicissitudes and outside factors. Thus the participant understands fully what to expect in lean years. Dr. Heilman leans toward payment in

common stock, because then the executive shares losses as well as profits—i.e., his dividends on accumulated stock are small in lean years. He believes that salaries should be the basis for apportionment. If salaries are thought to be improper for this pur-

pose of figuring profit shares, then they are inequitable rewards for day by day achievements. However, Dr. Heilman believes the higher salaried officials should get a somewhat higher percentage bonus than the minor executives.

Acetylene Meeting Discusses Pipe Welds

Leakless Joints Said to Warrant Adoption Even at Increased Cost—
Improved Welding Rod Produces Non-Porous Welds
in Alpha Brass Pipe

At the twenty-ninth convention of the International Acetylene Association, held in Chicago Nov. 14 to 16, Herbert L. Whittemore of the United States Bureau of Standards was awarded the Morehead Medal for "outstanding research work in welding." This medal is named in honor of the discoverer of the electric furnace method of making calcium carbide, the fundamental process underlying the entire industry. Mr. Whittemore's contact with organized research into the properties of welded joints, and the safety of welded pressure vessels has continued for several years past. Previous recipients of the Morehead Medal include Noah Wagner, pioneer builder of welded pipe lines; Edmund Fouche, inventor of the blowpipe; and Augustine Davis, dean of the American acetylene equipment industry. Mr. Whittemore was also presented with honorary membership in the International Acetylene Association, together with E. J. Smith of Underwriters' Laboratory, H. E. Newell of National Board of Fire Underwriters, and A. D. Risteen of Travelers Insurance Co., Hartford, all for signal services to the acetylene industry.

New officers elected are president, L. F. Loutrel, Shawinigan Products Corporation, New York; vice-president, C. A. McCune, Page Steel & Wire Co., Bridgeport, Conn.; and secretary, A. C. Morrison, Union Carbide & Carbon Corporation, New York.

Expansion in Use of Acetylene

Much discussion centered about the present status of the industry. Professor J. D. Hoffman, head of the Department of Practical Mechanics,

Purdue University, Lafayette, Ind., presented the accompanying figures indicating the growth of the welding industry since war times.

The oxy-acetylene committee of the association presented a 106-page report outlining the status of welding in various industries, and as viewed from various angles. In the opinion of the committee this survey proves that repair welding is expanding rapidly. Production welding is mostly confined to thin metal (furniture, barrels, storage tanks, utensils, automobile bodies, aircraft) and to pipe work (long transportation lines and industrial piping). Heavier plate work seems to be confined, at least as far as production is concerned, largely to the manufacture of unfired pressure vessels and chemical equipment.

At a meeting held jointly with the Gas Products Association (an organization of oxygen producers) the problem of expanding these production applications, by education or advertising, was discussed at length. It was pointed out that the designer and production man of tomorrow is the engineering student of today, yet it is well known that scant consideration is given welding as a joining method in most courses of laboratory or lecture instruction. Feeling that this is largely due to lack of information in the hands of the faculty, the two associations proceeded to organize a joint committee to promote the "education of the educators."

R. Witherspoon, of Shawinigan Products Corporation, Shawinigan, Canada, described the use of acetylene for synthesizing chemicals. In the last seven years his company has expanded to where it uses over a million cubic feet of acetylene daily, mostly

to make glacial acetic acid for the artificial silk industry. This is about eight times as much acetylene as all Canada uses for cutting, welding and lighting. At the indicated rate of expansion, Mr. Witherspoon estimates the American chemical industry by 1938 will be absorbing 1000 tons of carbide daily, ten times the present amount.

Industrial and Refrigeration Piping

Three papers on this general subject were presented. A. F. Hoesel, chief engineer Peerless Ice Machine Co., Chicago, told how the manufacturers of refrigerating equipment and ice making machines had gradually expanded the use of welded joints. At first only ammonia receivers were welded, then headers for pipe coils, and finally practically all the joints in the ammonia system on both the high and low-pressure sides. Costs are sometimes higher than flanged joints, but the savings in refrigerant in a leakless cycle overbalance this in a short time.

This same economic consideration was urged by J. H. Zink, vice-president Heat & Power Corporation, Baltimore, who said that first cost of a welded pipe installation could be higher than a screw coupled and flanged job, and yet competitive bids could be placed, because the piping contractor using welding was thereby relieved of the necessity of repairing leaks in an installation during the guarantee period. Both Messrs. Hoesel and Zink said that in the five years their respective concerns have been utilizing welding as a manufacturing or erecting method there has never been a leaky weld reported. Mr. Zink is strongly of the opinion that the oxy-acetylene process will enable steam heating contractors to surmount many of their present obstacles when it is used to the maximum extent for pipe welding, bending, and the making of specials.

F. E. Sellman, Servel, Inc., New York, described the methods used to train welders for domestic refrigeration. The Servel unit is made almost entirely of seamless tubing, ranging from 5/16 to 3/4 in. in diameter, and

wall thickness of 11 to 17 Birmingham wire gage. Manufacturing methods were described in *THE IRON AGE* for Feb. 2, page 321. In each unit 53 points are made, each of which must be tight against 900 lb. per sq. in. test pressure, and without interval "icicles." Twenty-one other welds make a total of 74 per unit, plus a considerable number on the metal cabinets and linings. It can be seen that the skilled labor to produce 250 such units daily represents a considerable problem.

Recently a plant of this capacity was constructed at Evansville, Ind. Profiting from previous experience, a welding school big enough for 50 students was immediately equipped; 50 girls were instructed on day shifts, 50 men on the night shift. Five instructors gave close attention to the work. The three principal steps in instruction are 1. Lay a bead on sheet metal. 2. Weld a flat seam in sheet metal. 3. Make welds in thin-walled pipe.

Apt students easily learn to make a neat weld, but it takes from three to six weeks to make one without internal icicles and which is tight against 900 lb. pressure. About half of those who start graduate. When put on production the new welders are still closely supervised; each joint as made is immediately tested under pressure, this practice continuing for weeks, and until the number of porous welds drops to less than one a day. Students are paid small wages during training; their rate is increased as ability in production is demonstrated. The Evanston plant is equipped with 184 welding stations.

Modern Swiss Welding Practices

A paper of the above title was presented by Prof. C. F. Keel, director of the Swiss Acetylene Association, Basel, Switzerland. His association is of semi-official character, being delegated with the authority to establish safety regulations and to make biannual inspections of all oxy-acetylene installations. In addition it conducts cooperative welding researches and a school for welders.

As a result of exhaustive tests, Swiss purchasers and engineers have removed all restrictions on the use of welding as a method of joining on boilers and pressure vessels, as long as the work is done in a plant known to utilize approved practices. Methods in use by Sulzer Brothers are typical, and have been described in *THE IRON AGE*, Sept. 6, page 567.

Welding technique as standardized in Switzerland is quite different from that accepted as best practice in America. Single vee butt welds are used, even on heavy plate, beveled to a 60-deg. opening. The blowpipe, producing a large flame having a considerable excess of oxygen, is held steadily at the very bottom of the vee, and the welding rod rubbed vigorously back and forth in the advancing puddle of molten metal. By such methods, Professor Keel says, good practice on

production in ½-in. plate will be as follows:

	Feet per Hour	Oxygen per Foot of Seam	Acetylene per Foot of Seam
Horizontal flat seam	4 to 5	12 cu. ft.	10 cu. ft.
Vertical side seam	5	9.6 cu. ft.	8 cu. ft.
Corner weld	10	7.2 cu. ft.	6 cu. ft.

Professor Keel said that since these revised practices and higher speeds had been attained, the amount of oxy-acetylene welding on heavy plate had doubled, at the expense of competitive processes.

American welding experts who commented on these figures, which are approximately twice as good as we are doing, were of the opinion that the Swiss welding technique makes joints with interior toughness when tested by bending so the bottom of the vee is stretched. Prof. Keel showed many slides of test pieces undoubtedly having high mechanical properties.

Bronze Welding Rod

It has been found by A. R. Lytle, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y., that if 0.5 per cent silicon is added to best brass welding rod (of "Tobin bronze," which contains a little tin) the volatilization of zinc during welding is almost entirely prevented. Furthermore, such a rod when melted into a joint in alpha brass or admiralty brass pipe will check the boiling and zinc vaporization, and produce a strong union free from porosity. The silicon may protect the zinc by preferential oxidation and by forming a thin slag, and also by increasing the solubility of gases in the hot metal. Unreinforced welds in 60:40 brass were stronger than the base metal; Muntz metal broke at 39,000 lb. per sq. in. along the scarf, due to an accumulation of lead which boils out of the heated zone. Alpha brass pipe, welded with the silicon-bearing rod, broke some distance from the joint at an average of 34,500 lb. per sq. in.; screwed unions break at about 21,000 lb. per sq. in. by shear along the threads. The weld metal itself (melted welding rod) has an ultimate strength of 50,000 to 60,000 lb. per sq. in., and an elongation of 12 to 19 per cent in 2 in. The bond between bronze weld and steel or cast iron is also increased 10 to 15 per cent. An important practical advantage is that the silicon-bearing weld metal can be remelted without damage.

I. T. Hook, research department, American Brass Co., Ansonia, Conn., described some experiments on steel, welded with bronze while under internal stress. Strips of medium carbon steel, such as used for automobile frames, were bent slightly and while under known load were heated and bronze weld metal flowed over the stretched surface. It was found that incipient cracking frequently resulted when the stress amounted to 4000 lb. per sq. in., while at 6000 lb. per sq. in. the piece would be broken apart by this procedure. It appeared therefore

that the cracks frequently found in bronze-welded steel are due to a species of season cracking or corrosion cracking.

In the discussion it was pointed out that these results indicated that steel should not be bronze welded except in unimportant or non-stressed locations, as one could hardly guarantee internal stresses less than 4000 lb. per sq. in. except in annealed metal. It is also possible that the differential stresses set up between the hot weld and the cold metal adjacent would produce stresses in excess of the danger mark during the actual process of welding.

Coated Electrodes Make Sound Welds

At a meeting of the Pittsburgh section, American Welding Society, Oct. 31, P. R. Hawthorne, welding engineer Petroleum Iron Works Co., Sharon, Pa., argued the case for covered and coated electrodes for arc welding.

"In order to produce a weld which is free from oxygen and nitrogen," Mr. Hawthorne said, "the atmosphere must be prevented from coming in contact with either the arc, the metal as it is deposited, or the deposited metal until its temperature is below 1800 deg. Fahr. To protect the arc and metal vapor from open air by mechanical means would not be practical. The logical method is to liberate, by the heat of the arc, a gas which will form a sheath or envelope around the arc, of sufficient volume and density as to actually exclude or combine the harmful gases. This is most easily accomplished by using a chemical covering of the rod which will be consumed in direct proportion to its rate of melting.

"To protect the metal during the solidifying and cooling period, there must be provided a substance which will completely cover it. This also is easily provided by covering the rod with a chemical which will distribute itself over the deposited metal and exclude the air. This protective coating has the further advantage that it prevents too rapid cooling of the deposited metal. Finally, to produce a perfect weld which is greater in tensile strength than the electrode, it is necessary to introduce certain elements which will absorb completely the impurities in the welding rod and parent metal and cause them to rise to the surface of the weld."

Assurance that the acceptors really follow out the provisions of the simplified practice recommendations of the commercial standards group of the Bureau of Standards, both in buying and selling, is indicated in the reports of surveys made on seven projects. Based on factual surveys, 82.33 per cent of the output of the commodities covered by these seven projects were in conformity with the adopted simplified schedule.

Operation of Open-Hearth Furnaces

Practical Problems Covered at Superintendents' Meeting—Quality Control for Steel a Live Topic

ABOUT 70 men interested in open-hearth work, mainly from the operating end, gathered at the William Penn Hotel, Pittsburgh, on the morning of Nov. 15 to discuss problems coming up in their work. This was the fall meeting of the Open-Hearth Committee of the American Institute of Mining and Metallurgical Engineers. The meeting lasted through three sessions, adjourning on Friday noon to permit the members to make a visit to the Edgar Thomson works of the Carnegie Steel Co. at Braddock, Pa.

In opening the meeting, Leo F. Reinartz, chairman, brought up the question of the open-hearth question-

naire, and reported that only twelve plants had sent in specifications and six had sent in drawings. He thought it doubtful if it would pay to go ahead in the preparation of this work without a larger response. At the same time, the question was raised as to whether the minutes of the meetings should be printed and, if so, who should be entitled to receive copies.

As has been the practice for some time, there were no set papers. A list of topics on definite subjects was opened for general discussion. The three sessions were devoted to (1) construction of furnaces, (2) quality control and (3) furnace operation.

under these conditions. It is usually placed about 3 or 4 in. above the highest point at which slag cutting occurs. It is, of course, not needed with sloping backwalls.

Charging Equipment

Reports were made by one superintendent after another as to the number of locomotives, charging buggies, boxes or pans, charging machines, stock house cranes, hot metal cranes, etc., in use. This can best be expressed in tabular form as given in Table I.

Accounting for Repair Costs

Generally speaking, the larger repairs or rebuilding are taken care of on a job order and charged against a reserve set up for this purpose on the basis of past experience. Smaller repairs, which go on week in, and week out, are charged ordinarily to operating expense. In many cases, new portions of the equipment are put into capital account whenever they represent an actual addition to the capital value of the plant. This, of course, is not so in mere replacements, however extensive or expensive they may be.

Some discussion came up as to whether costs of heating up the furnace after a general repair should go into operation or maintenance charges. Some men reported one thing and some another. In some cases the criterion came on the question of whether gas was on the furnace or not. Usually operating costs were charged with all hot repairs.

Rebuilding costs as a function of furnace sizes were discussed briefly, it being the consensus of opinion that about 5c. to a ton of steel would represent the difference between furnaces

Elements in Construction of Furnaces

NINE topics were scheduled for consideration under the general heading of furnace construction. Owing to time limitations, however, three of the topics were not discussed. The six others follow in order of presentation before the meeting.

Water Cooling of Furnaces

Various members told of the practice in vogue in their plants with regard to cooling portions of the furnaces by means of water. Doors and frames, bulkheads, bridge walls, ports, valves, etc., were pretty generally listed as being subject to this practice. Opinions differed, however, with regard to cooling of skewbacks. Some plants had experimented with this, with indifferent success. The brickwork did not stand up well and the roof was cut, which was laid in one instance to suspicion of moisture from the cooling pipe.

In general, it was reported that cooling is practiced in places where the brick shows a tendency to cut away, the object being to save on repairs and on delays for this purpose. The recirculation of the water was reported by some plants, although most of them do not use the water twice.

Consumption of water per furnace in 24 hr. was reported at figures varying from 700,000 gal. to 1,000,000 gal. Water was used at initial temperatures varying from as low as 60 deg. to 115 deg. Fahr. Some plants reported trouble from poor water, whether from mud and silt or from scaling due to hard water. Strainers are not always able to keep out the silt.

One plant reported using a closed system in which the water is circulated through a spray pond and about 500,000 gal. are in circulation at all times. The daily make-up water runs about 375,000 gal.

Water cooling along slag lines was reported by some plants, one of which has been using this practice about five years. At first there was some difficulty in holding the magnesite against the water-cooled surfaces. This was found to be due to putting it in in too generous doses. It now is applied a little at a time and burned on hard before the next batch is placed and the trouble has disappeared. This practice was reported to give a good foundation for the jambs.

Saving of brickwork and extension of the life of the backwalls by 15 or 20 heats was reported as the principal reason for using coolers at this point. Bricklayers can make a much better job in laying up front and back walls

TABLE I—CHARGING EQUIPMENT OF OPEN-HEARTH PLANTS

(a) And one of 10 tons. (b) Included in C; both in same plant. (c) And three gantry cranes. (d) 60 of them are 4-box. (e) 90 in open-hearth department; others distributed in other departments, to gather their scrap.

of considerable variation in size. In some cases, however, this difference was expressed as being as high as 15c. Furnaces compared in this manner were 68-ton against 115-ton and 40-ton against 85-ton, each pair in the same plant.

Whether each furnace should be handled independently of the others in cost keeping occasioned considerable discussion. Several speakers advocated a sharp distinction, because in no other way can accurate determination be made of the effect of changes made experimentally on a furnace for the purpose of improving operating conditions or reducing operating costs. One man reported taking the average of the three previous years as a basis and setting that up as a bogey for the next year's operation. Year by year this bogey would change a little, but it would remain at about the same level.

Organization of Plant

Superintendents reported the number of men required for operating plants of varying sizes, with varying numbers and capacities of furnaces. These differed so markedly with the conditions in the plant that no general statement can be made regarding them. They are, however, covered briefly in Table II. The number of men per furnace is seen to vary all the way from 21 up to 40. In a few instances the plants are operating on 12-hr. shifts, and these naturally use a smaller number of men. These reports cover everything relating to operation, including engineers for the locomotives handling stock (and usually delivering steel to the blooming mill), mechanical men, electricians, ladle lining; even in one case the skull crackermen were included. All repair men except the brick gang came under this heading.

Lining of ladles was discussed at some length, particularly with regard to use of a gun to put clay against the refractory brick. One man reported using a gun for about 10 min. on each ladle after each heat, putting a thickness of 1/4 in. on a backing of 5 in. of brick. He reported getting 26 heats average out of the ladle before having to renew brick. Another man who put the material in by hand uses about 2 in. of ganister with enough clay for

a binder on the surface of the brick. In this case there are two layers of brick 2 1/2 and 4 in. in thickness, with 1 1/2 in. of clay mud against the steel shell.

Keeping Mud Out of Steel

On the question of whether the mud or ganister gets into the steel, one man reported mud-lined ladles running as many as 50 to 150 heats on a brick lining without any such trouble. He does, however, burn this mud lining on very hard by means of an oil flame.

Another man reported using ganister with a gun as coating for a hot-metal ladle of the Pugh type, and said that the skull obtained was very small, rarely reaching 0.2 per cent. Ladles of this type were reported as handling from 19,800 to 31,800 tons of metal before relining was necessary. Another speaker, however, stated that he had tried this kind of lining and found that it peeled off badly, so he had given it up.

Special checker brick of the Loftus type have been put into a number of furnaces, some of which were reported upon. In one case, a 20-ton acid-lined furnace, making steels mostly from 0.25 to 0.30 per cent carbon, and tapping as high as 2900 deg. Fahr., was redesigned from a gas-producer furnace into one burning fuel oil. Originally all the regenerators were equipped with 9-in. brick. After running for 9 months these straight brick were taken out of what had been the gas chambers and Loftus bricks were put in, without making any change in the air chambers.

Loftus Brick Keep Clean

This furnace has now been running 4 months under the new arrangement and the checkers appear to be clean from dust and show no cutting or deterioration. They are carrying most of the load, as the old air checkers have been found to be practically inoperative. Clay brick are used below, and silica on the top, the opening being 6 x 6 in. A new furnace, being installed in this plant, will be equipped entirely with Loftus checker brick.

Another superintendent reported having made the same sort of change from a gas-producer furnace to put in Loftus bricks. The checkers were re-

ported clean, most of the dirt having been washed down into the sewers. The throat between the checkers and the flues, however, was badly choked up. After 285 heats this roof had to be renewed and most of the checkers were taken out. They seemed to be about as good as new, but there was much dirt in the lower parts of the flues.

Another speaker reported that furnaces fitted with Loftus brick in the air chambers and regular 9-in. brick in the gas chambers, using producer-gas, are working faster and better than with 9-in. brick all around. This same story came from another source, in which it was said that after 120 heats the regular furnaces had to be shut down for cleaning flues, whereas under the new arrangement a much larger number of heats could be run without stopping. In this case the furnace was making steel faster to the extent of 0.8 ton an hour, and was using less oil by about one gallon a ton.

Stevens Open-Hearth Furnaces

Brief description was given of a 25-ton acid-lined furnace at Indiana Harbor, which has been operating nearly two years under the Stevens arrangement. The furnace is built largely of structural steel, is covered with steel plate to the floor line or above, and is insulated. The covering includes the regenerators and slag pockets. The chambers are under the hearth of the furnace and have 13 ft. depth of checker brick, with a top area 9 ft. 6 in. square. The top layers of the brick are silica and the lower portion clay. After 500 heats the furnace had to be shut down because the regenerators became clogged up, having only 3 1/2 x 3 1/2-in. openings. At the time of the report 1014 heats were out and the superintendent thought the furnace was good for 2000 heats. The slag pockets are cleaned occasionally and the roof is said to be in fine condition.

Air supply is by means of a fan, with the amount carefully proportioned. Control of this amount is by a Stevens valve. The stack draft is handled about as is usual on other furnaces.

Good operation on furnaces depends in large measure on uniformity of operation, and this was reported to be obtainable on furnaces without the Stevens control. It was claimed that as good fuel economy can be had in regular furnaces, by careful attention to uniform operation, as in the Stevens type. On a standard set-up open-hearth men have been operating their furnaces for specific purposes about as boiler men are said to operate their boilers.

These furnaces are scheduled, for foundry use, to tap their heats at certain hours, and it was said that they can come, usually, within 7 min. of the specified time. This is being done in shops having one, or two, or three furnaces; oil flow meters, indicating, recording and integrating, are used; there are differential draft gages and

TABLE II—OPERATING FORCES IN OPEN-HEARTH PLANTS

recording CO₂ meters between each furnace and the stack.

A letter was read from Carl W. Peirce, formerly superintendent of open-hearth, Mansfield Sheet & Tin Plate Co., stating that the Stevens furnace at Indiana Harbor was the best open-hearth job he ever saw, from the engineering standpoint. He even predicted that in three years the present method of operating open-hearth furnaces is likely to be obsolete. The new method takes the element of guesswork out of the subject of combustion. Just enough air is used for proper combustion. He reported very small accumulations of slag—only about 6 in. in each pocket—and about 1 in. of dirt on checker brick. The yield was said to be 2 per cent better, oxides in the slag less by one-third, pig iron in the charge less by one-third, and loss of castings cut in half.

Former fuel consumption of 44 to 56 gal. to the ton was reported to

years ago in England, and said that by 1900 the 50-ton furnace had become common. At that time, however, much doubt was expressed as to whether the size and depth of the bath could be greatly increased to advantage, and the question of taking care of enormous volumes of slag was held to be a governing condition. Excessive chilling of steel in a big ladle seemed to be a bugbear.

However, economically the value of the big furnace is found, both in operating cost and in maintenance of quality. Originally one plant had seven furnaces designed for 105 tons each. These were first operated eight years ago. Gradually these furnaces were charged more heavily, first up to 130 tons and then to 150 tons, at which point six of them are run today. Last year three new furnaces were installed, of 250 tons each, and one of the older furnaces was remodeled to take that same amount. Last April the first heat was poured from a new

metal and other materials on the charging floor, four ladle cranes and three pouring platforms, each capable of pouring two ladles at once. The 250-ton and 300-ton furnaces are emptied into two ladles at each tap through a Y-spout. As a result, all ladles of metal in this shop carry from 125 to 150 tons each.

A slightly greater yield was reported on the deeper bath, this being due, according to the speaker, to a smaller amount of oxidation, because there is less surface exposed for each ton of steel in the bath. The largest furnace produces 17.3 tons of steel an hour for each 1000 sq. ft. of hearth area. There is comparatively little bottom trouble. Coal, when the furnace is new, runs about 420 lb. to the ton of ingots, and reaches 480 lb. when the furnace is about ready to go off for repairs.

Another shop reported about the same sort of experience on large furnaces. In this case there is one furnace of 175 tons and one of 140 tons, whereas all the others in the shop are of 80 tons. Rebuilding and general costs for the larger furnaces are less per ton of steel. This speaker thought that 300 tons was about as large as a stationary furnace can well be operated. He believed, however, that some saving might be made by going to a 450-ton tilting furnace. He believed that it would be difficult to design a satisfactory spout for three ladles of 150 tons each.

At this point the chairman referred briefly to an article in *THE IRON AGE* of Sept. 20 last, page 693, in which Carl W. Peirce advocated the use of tilting furnaces, as an improvement over the stationary type.

TABLE III—BATH SIZES IN LARGE STATIONARY FURNACES

Number of Furnaces	Unit Size	Bath Area		Depth of Bath
		Length	Width	
Six	150 tons	40 ft.	16 ft.	2 ft. 6 in.
Four	250 tons	45 ft.	17 ft.	2 ft. 10 in.
One	300 tons	49 ft.	19 ft.	2 ft. 10 in.

have been reduced on the first 500 heats to 23.68 gal. This, however, was figured on the *net* ton of the *charge*, and not on the *gross* ton of ingot *production*. The saving on oil alone was said to be \$90 to \$100 a day. On this basis the cost of the change-over was figured as covered in 250 working days. Brick work results are as yet not ascertained, but it was said the saving here might reach 50 per cent.

One speaker credited Mr. Stevens with selecting in his furnace arrangement all the best principles of the open-hearth and eliminating all of the worst ones. When it comes to controlling a schedule for tapping heats, however, this speaker said that the beginning lies with the purchasing agent, and particularly with the type of material he buys to make up the charge. Then comes a proper segregation of the materials in the stockyard and good selection of those materials by the stock foreman in making up in the charge. This permits scheduling furnaces as much as two weeks ahead.

A brand new furnace of 100 tons capacity, on the Stevens principle, was reported going in at the plant of the Laclede Steel Co. In this case the regenerators will not be directly under the furnace, but will be a little off to one side.

Value of Large Furnaces

Considerable discussion centered around the ultimate size of open-hearth furnaces. In tracing the history of this subject one speaker referred to the 3-ton furnaces built 60

300-ton furnace. The hearth sizes and depth of bath of these furnaces (all of which are stationary) are shown in Table III.

To operate the shop containing these 11 furnaces there are four charging machines, two cranes handling hot

Controlling the Quality of Steel Produced

EIGHT topics were listed in the program under the general heading of "Quality Control." Seven of these were covered during the second session, while the other was taken up at the beginning of the third session. The first topic under the general heading was a résumé of two years of research work on the influence of iron oxide on metals, as well as the formation and identification of inclusions such as iron oxide, manganese oxide and silicates. This was presented by Dr. C. H. Herty, Jr., of the United States Bureau of Mines, Pittsburgh.

Generally speaking, heats will clean up from an excess of silicates in from 12 to 18 min. after an addition of ferrosilicon in the bath. These heats, of 0.10 per cent carbon steel, are ready to tap in from 10 to 25 min. more. With a higher carbon, however, around 0.18 per cent, the reboil is not over until 20 to 26 min. after the addition has been made. These conditions, as well as the increase of FeO, were illustrated by a number of charts shown to the meeting.

Holding the steel in the ladle for a short period, to get rid of inclusions by permitting them to rise to the surface, was advocated by the speaker.

If, on the other hand, the steel is teemed very quickly after it gets into the ladle, it will not clear up properly and the inclusions will be found in the ingots. Study of chipping costs, in cases where ingots were segregated as to time of pouring in the heat, showed these costs much higher for the last ingots teemed than for the earlier ones.

Methods of taking out a sample were discussed, some members questioning the ability of the sample taker to get clear steel without considerable slag in it. This point of view was disposed of by Dr. Herty by the statement that the slag is already solid on the spoon before the steel gets into the spoon, that it remains solid after the steel has been poured out cleanly from the spoon, and that the steel samples would clearly show the fact if there were slag inclusions in them.

Changes in operating conditions in the blast furnace were reported to increase the proportions of oxides in the iron. The same is true of silicates, whether the silicon in the blast furnace is going up or down. Only when conditions are about stable are low silicates to be expected.

When putting ferromanganese and

ferrosilicon into the bath, the speaker recommended putting the ferromanganese in first, and then adding the ferrosilicon as soon as the ferromanganese has melted. If this is not done, all the MnO will be worked out of the bath before there is opportunity to use it in handling the silicon and the work will have to be done all over again.

This report became the basis of a steady volley of questions and answers on various phases of the topic as reported.

Difficulty in Welding Skelp Steel

Nickel, copper, lead and tin in the charge, or remaining as residuals in the steel, were cited as elements which increase the difficulty of welding skelp steel. One man reported that, if the nickel is more than 0.05 per cent, there will be trouble. Another man makes every endeavor to keep the nickel under 0.08 per cent and copper under 0.12 per cent. In his plant he likes to keep the phosphorus rather higher than the 0.04 or 0.05 per cent recommended by other speakers, letting it go up to 0.07 or even 0.09 per cent.

In bottom casting of ingots trouble is experienced from the steel carrying part of the runner brick or slurry into the mold; hence, top casting is employed when the steel is to be made into skelp. In some plants which do not employ top pouring trouble was reported in the welding. A distinction was drawn here, however, regarding the type of welding. With gas and electric welds, copper content seems to make no difference, whereas with the customary welding in a pipe machine it is deleterious.

Reducing Pipe in Special Steels

Manufacture of steels containing 0.20 to 0.30 per cent carbon, 0.70 to 1 per cent manganese, and 0.10 to 0.15 per cent sulphur was discussed from the point of view of reducing what many makers find an excessive amount of pipe in the ingots.

Several speakers reported having a great deal of trouble from pipe with steel of this type, although most of the men present had had little experience with this particular specification. Keeping the tops of the ingots clean by means of thorough killing of the steel was recommended as a palliative. One superintendent reported that on this type of steel all he can count on getting in the shape of sound billets is 70 per cent of the ingot, whereas for the more usual steels he gets from 85 to 88 per cent in good product.

Cracking of Ingots in Rolling

It seemed to be the general opinion that ingots poured on the bottom cast principle rarely crack in the blooming mill. Only when rolling top cast steel is this trouble encountered, and one man expressed the view that most of the top cast ingots crack during rolling. The distinction between the two methods of pouring was brought

out in connection, particularly, with a 3-high 46-in. bloomer in which 19 x 22-in. ingots are reduced to 7½-in. blooms in nine passes.

Most of the open-hearth men admitted frankly that this trouble can be traced in very many instances to the open-hearth department. Part of this difficulty was ascribed to teeming the ingots at too high a temperature, resulting in surface blowholes or those very near the surface. Use of graphite wash in the molds was reported to assist the steelmaker here in avoiding cracks on low-carbon steel, but they show up just the same on rail steel.

Heating of the ingots in the soaking pits was blamed by some speakers for the tendency of ingots to crack. Pin-head blowholes near the surface of the ingot were said to be very sensitive to the soaking pit gases, and the ingot under these conditions will cut badly on the surface.

Heater Should Know Steel Condition

Ordinarily, the heater does not know what the condition of the steel is in this respect and can therefore do nothing to remedy the situation. One plant reported an attempt to keep the heater informed so that he could handle the steel to better advantage. It was the opinion that neither the mill drafts nor the speed of rolling could be held responsible for these cracks.

Uneven heating, slag inclusions and thin-skinned ingots were given as primary causes by one metallurgist. Another man thought that many of the vertical cracks are caused by insufficient radius in the corner of the mold. He reported changing this radius from 2½ to 4 in. and getting away from most of the trouble. Another speaker recommended getting the steel into the soaking pits hot, even before it is set, and letting the heater know what the condition is so that he can carry his gases in a way to avoid cracking. If, on the other hand, the steel is allowed to cool so that, when stripped, the corners show black, nothing the heater can do, in the opinion of this speaker, can help.

Molds Partly Responsible

Faulty mold design and occasional cracks from stickers in the mold were charged with a share of the responsibility. But the main cause was reported to be the way the steel is made, with temperature a very large factor. One man reported having gone to the use of corrugated molds, after which he got rid of the trouble. These are almost parallel sided, having only ¼ in. taper, and considerably less scrap is produced.

When the interior of an ingot, as shown by microscopic examination, is found to be clean, some of the same ingots occasionally show on the surface a residue of undetermined composition. This was ascribed by one speaker to dirt in the mold. Another man said that graphite mold wash, if the graphite happens to be high in ash

content, will mark the surface of the ingot.

Titanium gives a cleansing effect through quickly working gases through the molten steel. In plants where this is used some judgment is required as to quantities and an effort is here made to keep the aluminum additions down. One speaker, however, reported that additions of titanium show a tendency to produce a thin-skinned ingot and thus cause cracks in rolling.

Titanium and Aluminum in Rimming Steel

Another man reported using titanium, particularly on small ingots, but reported that aluminum was just as good a deoxidizer on the larger sizes. A plate mill man said that, when he reduced the amount of titanium previously used, the plant immediately got into trouble from seams in the steel. Still another man, who reported trying to get away from the use of titanium because of its cost, said that he had always had to go back to it, because of complaints on seams, received from the sheet mill.

Other speakers reported an advocacy of spiegeleisen as a deoxidizer and said that they were not using either titanium or aluminum at all. Spiegeleisen was reported to clean up rimming steel in good shape, about 1000 lb. being added in the furnace on an 80-ton heat, about 25 min. ahead of tapping time, when making steel of 0.08 to 0.12 per cent carbon.

Best Slag Conditions for Low-Carbon Steel

Discussing what silica content the slag should have when the open-hearth furnace is making steel of 0.08 to 0.11 per cent carbon, and the best content of FeO and Fe₂O₃ in the slag, Doctor Herty advocated 14 to 19 per cent silica in the slag, and 16 to 22 per cent iron oxide, without distinguishing between the two forms. This is for rimming steel, and it was said that, if these figures run too low, the steel will not rim well in the mold.

Slag samples should be taken from at least three doors, then mixed and crushed. Passing them over a magnet will remove the iron content and the slag is then ready for analysis. Generally speaking, it is found that a higher line content in the slag is associated with a higher Fe₂O₃ content, and vice-versa.

Determination of FeO was had by analyzing for total Fe and for Fe₂O₃, taking the difference as FeO.

Report on Isley Furnaces

Two open-hearth furnaces of 100 tons each in one plant have been fitted with a combustion control system, on the Isley principle. These units measure 15 ft. 6 in. by 38 ft. inside the brick at the bath level. Each is operated with the aid of two No. 90 Sturtevant fans, driven by 75-hp. d.c. motors. It is found necessary to maintain a nice control, or balance, between the effect of draft at one end of the

furnace and pressure at the other end. Otherwise it is very difficult to control the flame.

Comparing the operation of these two furnaces with the best working furnace in the shop, not fitted with this system, some decided improvements in operation have been observed. The steel made is mostly dead soft. The best furnace has been making 8.2 tons an hour, whereas the two Isley furnaces have averaged 9.18 tons an hour, thus showing an improvement of the order of 12 per cent. Each of these furnaces has had one rebuild, having turned out an average between them of 45,312 tons of ingots. This is 8 per cent more than the run of the best other furnace, which produced 41,834 tons. The roof life was reported to be about equivalent in the two cases. Fuel consumption to the ton of ingots was said to be $8\frac{1}{2}$ per cent better than for the best other furnace. Operating costs were estimated at 10 per cent better.

While the checkers were practically clogged up at the end of 320 heats, draft was still maintained in good condition by forcing the air or products of combustion through by means of the fans. Gas consumption for each ton of ingots on the Isley furnaces figured out at 5,812,000 B.t.u.

Obtaining Thick-Walled Ingots on Rimming Steel

Dropping of the steel in the mold a matter of 4 or 5 in. was reported by one speaker as making the blowholes very deep seated—sometimes as much as 4 or 5 in., inside the skin. These thick-skinned ingots, however, have to be heated a long time to obtain proper rolling conditions. One plant, which has a $2\frac{1}{2}$ -hr. minimum heating period, stretches this out another hour if for any reason it is felt that the steel needs it. The speaker was not certain whether a 3-in. skin is better than a skin of $\frac{1}{2}$ or $\frac{3}{4}$ in.—that is, $\frac{1}{2}$ or $\frac{3}{4}$ in. might be adequate for good rolling. On sheet bar the average in this plant was given as $2\frac{1}{2}$ in.

Slag conditions and the temperature of the bath are regarded as important factors by some operators. The use of fluorspar was advocated in creating a slag which would be suitable. This speaker considers $\frac{3}{4}$ -in. skin thickness adequate for good rolling and is satisfied in some cases with $\frac{1}{2}$ in.

Another man stated that the matter depends upon the temperature at which the heat is tapped, the temperature of the molds and the speed of teeming the heat. Bottom-pour ingots practically never crack in rolling, it was said, because they are poured so slowly that they naturally obtain a thicker skin than with hot pouring of the same steel.

Another report laid poor steel to improper action in the bath, resulting from the use of pig iron too low in silicon. In this plant iron is desired with 1.25 to 1.35 per cent silicon, rather than 0.75 per cent. This speaker

thinks that the proper place to produce good quality is in the open-hearth furnace. In his plants slab ingots are made in large numbers. He finds that the thicker ingots give better results than the thinner ones. For instance, an ingot 21 by 48 in. gave much poorer results than with the larger molds, measuring 30 by 70 in. or 40 by 90 in. This he attributed, in part, to the more rapid filling of the smaller in-

got, poured from the same nozzle and with the same quantity of steel to the minute. This factor was emphasized by his statement that most of the defects in the steel are found in the ingots first poured, because when the ladle stopper is first opened up the stream is faster on account of the greater head of metal over it.

(To be concluded)

Gray Iron Institute Now Has 83 Members

Some Results Already Achieved, Notably the Elimination of Unfair Practices, Say Reports at Annual Meeting

CONSIDERABLE work has been accomplished for the gray iron foundry industry since the organization of the Gray Iron Institute, according to the report of its president, Walter L. Seelbach, at the first annual meeting of the institute held at the Cleveland Chamber of Commerce, Cleveland, Nov. 14. He stated that the mere existence of the organization is having a good effect in that there are evidences that some unfair practices are being eliminated. Arthur J. Tuscany, manager, reported that 17 members had been enrolled since the starting of a membership campaign last month and that the institute now has a membership of 83.

Preliminary reports were made on the organization of a research committee by B. H. Johnson, Cresson-Morris Co., Philadelphia, vice-president; on a merchandising committee to study distribution problems by Don McDaniel, Hamilton Foundry & Machine Co., Hamilton, Ohio; on a finance committee by Edward B. Sherwin, Chicago Hardware Foundry Co., North Chicago, Ill., and on plans for cooperation with existing organizations in other branches of the foundry industry by A. E. Hageboeck, Frank Foundries Corporation, Moline, Ill. He pointed out that the formation of the institute offers opportunities for cost study. H. S. Chafee, Builders' Iron Foundry, Providence, R. I., gave a summary of the financial status of the institute.

An expression of appreciation of his cooperation in the organization of the institute was extended by the directors to Dan M. Avey, editor of *Foundry*, who served as organizing secretary previous to the completion of the formal organization. Mr. Avey was presented with a golf bag and set of golf clubs.

Thirteen of the old board of directors were reelected and two vacancies were left on the board. It is planned to fill these during the year by foundrymen located in districts not now represented on the board. Those reelected were: J. H. Bruce, Bowler Foundry Co., Cleveland; J. L. Carter, Barlow Foundry Co., Newark, N. J.; H. S. Chafee, Builders' Iron Foundry, Providence, R. I.; A. E. Clarke, Des Plaines Foundry Co., Des Plaines,

Ill.; J. D. Coltman, Bullard Machine Tool Co., Bridgeport, Conn.; Horace R. Culling, Carondelet Foundry Co., St. Louis; Fred Erb, Erb-Joyce Foundry Co., Detroit; W. J. Grede, Liberty Foundry Co., Milwaukee; A. E. Hageboeck, Frank Foundries Corporation, Moline, Ill.; B. H. Johnson, Cresson-Morris Co., Philadelphia; Don McDaniel, Hamilton Foundry & Machine Co., Hamilton, Ohio; Walter L. Seelbach, Forest City-Walworth Run Foundries Co., Cleveland; Edward B. Sherwin, Chicago Hardware Foundry Co., North Chicago, Ill.

The old officers were reelected at a directors' meeting following the annual meeting. They are: Walter L. Seelbach, president; B. H. Johnson, vice-president; A. E. Hageboeck, vice-president, and H. S. Chafee, treasurer. These with J. L. Carter will now serve as the executive committee.

At a meeting of the new board formal action was taken authorizing the appointment of a cost committee, research committee, merchandising committee, trade practice committee and committee on statistics. These committees will be named by the executive committee.

Previous to the annual meeting the old board of directors was addressed by Dr. Hugh P. Baker, Washington, manager of the Trade Association Department of the Chamber of Commerce of the United States, who explained the lines of development possible to trade associations under present Government agencies.

New Alloy Casting Plant

Frederick L. Hewitt, formerly vice-president of the Hanson-VanWinkle-Manning Co., is chairman of the board of directors; John D. Scott, president; Claude L. Witter, president of the Provident Engineering Corporation, Philadelphia, vice-president; and Albert W. Gray, Hartford, Conn., treasurer and secretary of the Scott-Witter Steel Corporation, Hartford, Conn., a newly formed \$575,000 company to manufacture carbon and alloy steel castings at the former plant of the Connecticut Electric Steel Co., Flatbush Avenue, Hartford.

"Bootleg Loans" Upset Forecasting

Credit Expansion, Outside of Banking Channels, Prevents Old Sequences, Says
Colonel Ayres Before Harvard Economic Society

"LOANS to others" (called "bootleg" loans by some commentators) have upset old rules of forecasting, according to Col. Leonard P. Ayres, vice-president Cleveland Trust Co., Cleveland, who addressed the Harvard Economic Society on "The Business Prospect" at the annual dinner of that organization at Boston, Nov. 17.

In the past short-term money rates were the best indicator of the immediate business trend. When interest rates became too high to carry stocks on a margin, stock prices went down. Such a signal came in February, 1928, he said, but since that time stock prices have risen to new heights. A reliable indicator went wrong.

Formerly, when interest rates were low, municipalities and corporations issued securities to finance construction work and improvements, and when interest rates rose, they stopped floating such issues. In 1928 it seemed as if these old sequences would operate according to precedent, he said. Issues of securities did, in fact, turn down sharply, but after a short dip rebounded, with especially large new issues in October and November. Another good rule had gone wrong.

Construction used to vary inversely with money rates. When they became high, there was a temporary downturn in building activity. But in October, construction turned up to a new record level.

For 50 years, almost without exception, bond prices rose so long as they yielded more than commercial paper. When interest increased sharply this year, bond prices went down, as they were expected to, but they then recovered and went up again. Another old precedent broken.

In the past commodity prices went up when short-term money rates went down, and vice-versa. But not so this year.

One reason for the failure of old rules to work is that in the past business men felt that when interest rates went up, credit was going to be not only expensive but decidedly scarce. A new distinction, therefore, must be drawn between a rise in the cost of credit and a possible stringency in credit.

While this new attitude toward interest rates is important, it is not, in Colonel Ayres's opinion, important enough to account for the unusual economic developments of the past year.

What we are now experiencing, in his view, is gold inflation after the gold is gone (1928 has seen a loss of

about a half billion dollars in our monetary gold, about one-ninth of our total supply).

The high rate of industrial activity, the record rate of construction, the advances in commodity prices and the unprecedented stock market have meant the use of a far greater volume of credit in 1928 than in 1927. The increase in credit has come through loans to brokers from firms and individuals rather than from banks. Such loans this year increased a billion and a half dollars without any decrease in bank reserves. In the main, they reflect a new policy of corporations, although some of this credit represented loans of firms, as well as foreign money.

Corporation Cash Reserves Being Loaned on Call

Corporations, in the years of credit redundancy through which this country has passed, built up large cash reserves. These reserves are now being loaned for stock market speculation. The banks themselves are in part responsible for this development. Seeing the opportunity for commissions, they solicited the funds of corporations to put out on call. To overcome the conservatism of corporation treasurers they made such a strong case for the safety of call loans that in many instances companies not only put their spare funds out on call but withdrew virtually all their reserves from the banks for such use.

It is clear, said Colonel Ayres, that we have a new kind of credit instrumentality outside of the banking system, free from and beyond the control of the Federal Reserve system. Unchecked by any moral or legal restraints, it is possible that some time, but not now or soon, this form of credit will be regulated by legislation. It is also possible that there will some time be a reaction in the stock market that will chase out a large number of margin speculators. On the other hand, Colonel Ayres stated, this kind of loaning may continue until the country grows up to it and absorbs the credit in industry and trade.

While this supply of credit is not an inexhaustible reservoir, there is no way of telling how much more there is.

No Definite Forecast of Business Possible

Colonel Ayres said that he and one of his colleagues had worked out a general forecaster on a basis of multiple correlation, using factors that had proved dependable for 30

years. This forecaster shows business rising until the middle of 1929 and then dipping sharply. While the situation may work out that way, Colonel Ayres is disinclined to commit himself, in view of the new unknown factor—"loans to others." He said that he would not attempt to make a definite forecast for 1929. The present momentum of business, he thought, would probably carry over into the second quarter, and might even carry through all of next year, depending on developments that cannot be foreseen.

Purely Mechanical Forecaster Not Dependable

Another speaker at the dinner, Warren M. Persons, vice-president National Investors Corporation, New York, said that an accurate business forecast cannot be obtained from any mechanical medium. Moreover, business cycles do not come in one pattern, nor are they periodic. Some cycles are long, some are short.

Prices Declining in Europe

THIS country has been drawing gold from abroad since August, said Homer B. Vanderblue, Harvard Economic Society, at a session of the meeting on Saturday. This is causing pressure on credit and prices in Europe, as was the case in 1925. In fact, European commodity prices in the third quarter of this year declined, and there are indications that a similar trend is setting in in this country.

The stock market, according to Professor Vanderblue, is in a vulnerable position. When sentiment is all bullish, it can be quickly turned to the opposite view. So long as there is ample room for credit expansion (the Federal Reserve ratio is still relatively high), periods of readjustment will be transitory and temporary. A continuance of a selective stock market through 1929 seems likely. Building and instalment selling will probably be affected by tight money.

Active First Quarter in Automobiles Forecast

STOCKS of passenger automobiles in hands of dealers and at factories are subnormal, according to F. Leslie Hayford, economic statistician General Motors Corporation, New York, who spoke Friday evening, Nov. 16. This situation points to heavy automobile output in the first quarter, and probably the second quarter, of next year. A trend line prepared by Mr. Hayford indicates that in the past two years there has been a de-

ferment of buying amounting to 900,000 passenger cars. Production of such vehicles this year, at about 3,500,000, will be about 150,000 cars below the calculated normal. Estimated normal output in 1929 will be 3,800,000 passenger cars. Adding truck output, Canadian production, and exports, the total for next year should be 4,800,000 vehicles. Mr. Hayford, however, pointed out the shortcomings of mathematical calculation as a means of accurate forecasting.

Control of Production Influences Copper Market

THE Copper Institute was formed a year ago, said F. E. Richter, economic statistician American Telephone & Telegraph Co., New York, and no one thought at that time that it would function so effectively so soon. While prices have not been directly controlled, no doubt exists that they have been indirectly influenced through control of production. A short-term correlation exists between curves of prices and refinery stocks. Stocks in this country in October were equal to less than one-third of a month's output. Refinery stocks in the Western Hemisphere are at the lowest levels since 1922.

The present year promises to usher in a new era in production replacing the one that began in 1895, in which this country consistently accounted for more than half of the world output. This year United States production will fall short of 50 per cent of the world total.

World production has gone up this year, but consumption has apparently risen proportionately. The course of prices next year, however, will depend to a considerable extent on the production policy of the Copper Institute.

Rationalization Aids Oil Industry

TWO outstanding features of the oil industry in 1928, according to J. E. Pogue, consulting engineer, New York, were:

1. Progress toward improved economic control through rationalization of production here and cartelization of the industry abroad.

2. Betterment in the statistical position and price of gasoline.

It became necessary early in 1928 to stem the flood of oil. This movement was initiated by producing companies and supported by States through commissions on conservation. As a result, production of oil was held at 2,400,000 bbl. a day early in the year and at 2,500,000 bbl. since August. This action permitted demand to catch up with supply.

A remunerative price for gasoline appeared in mid-year, and it is probable that gasoline would have advanced even if no element of artificial control of crude oil output had entered.

The stabilized crude oil market resulted in a slight advance in oil, but most of the profits of the industry came as a result of the operation of the law of supply and demand in

gasoline. The situation in gasoline was aided, but not determined, by crude oil curtailment.

In 1929 there is likely to be a strug-

gle between rationalization and potential oversupply. Crude oil output will probably increase despite the restraints imposed.

Must Consider Buying Trends

Dr. Julius Klein Emphasizes in Annual Report the Necessity for Making Adjustments to Modern Conditions

WASHINGTON, Nov. 20.—During the past decade the country has changed from a seller's to a buyer's market, Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, Department of Commerce, says in his annual report. Consumers are declared to be no longer willing to accept commodities simply because they are offered. Distributors, it is pointed out, are finding that many articles which once moved rapidly are no longer in demand and cannot be handled at a profit.

"The manufacturer or distributor who fails to take into account buying trends, commodity preferences and consumer habits is failing to make adjustments to modern conditions, and one of the major undertakings of the domestic commerce division of the bureau is concerned with a series of surveys designed to throw light on these obscure phases of domestic commercial technique. For the purpose of these surveys the country has been divided into nine areas whose boundaries have been fixed partly by differences in economic and business conditions and partly by administrative convenience."

The report discloses the comprehensive character of the trade promotional activities of the Department of Commerce, both in foreign and domestic fields. During the past fiscal year, the report shows, 800 firms and individuals voluntarily reported known sales and savings directly traceable to the bureau's activities totaling \$15,000,000, or an average of \$18,000 per firm. The bureau currently serves about 22,000 firms. On 3,000,000 occasions during the fiscal year, or nearly 10,000 each business day, it is pointed out, the bureau rendered some specific service to the American public.

In the face of the most vigorous competition, the report says, American exports of finished manufactures have steadily advanced until last year they reached the total of \$2,061,000,000, an increase of 4 per cent over the previous year and fully 70 per cent over 1921-22. Of the output of American plants, 8 or 9 per cent is exported, it is stated, representing the production of not far from 1,000,000 industrial workers. Not including clerks and other salaried workers, the report says, there are employed 75,000 workers to produce the machinery exported; 24,000 to manufacture the iron and steel that goes to world markets; 47,000 to turn out automobiles and parts for overseas

buyers and 5500 in tool and cutlery works.

Statistical Standardization Needed

Listing problems facing American business, Dr. Klein mentions the need of simplification in the terms and phrases in which trade is conducted and of standardization of statistical methods. The movement for industrial combinations in the form of international cartels, Dr. Klein points out, has attracted a good deal of attention during the past few years and is likely to exercise considerable influence on American economic relations with foreign countries. A preliminary study of the subject has been undertaken by the bureau and it is believed by Dr. Klein that the importance of the movement would justify a wider investigation. There is need also, he says, for the bureau to further the effort of American industry to take speedy and effective action to protect itself against loss of good will in established and potential markets from effects of piracy of trademarks, misleading imitation and other means of "passing off" spurious merchandise.

Broader analytical studies which the bureau has made of the finances of foreign countries and which have proved of usefulness to American investors are urged, as well as studies concerning various problems surrounding the establishing of sales and distribution organizations in new areas abroad by American manufacturers. It is also declared that the adoption of uniform codes of customs regulations and port procedure would do much to lessen the perplexities of exporting. Producers and distributors, it is declared, feel that, if further study could be made within the department, and selected trade associations could be approached on the possibility of developing a system of certification by the trade association concerned that exported goods are in accord with given specifications, recognition of this certificate by customs authorities in foreign countries might then be sought.

Discussing the study undertaken of industrial equipment to give factory owners a clearer idea of losses suffered through the use of partially obsolete machinery, Dr. Klein says the worrisome question of when to scrap a machine and the proper methods of accounting for obsolescence as distinguished from depreciation cannot be solved until a better factual basis has been established.

Describe Progress in Sheet Rolling

Mechanical Engineers Also Discuss Other Iron and Steel Matters
at Meeting in Chicago Last Week

MECCHANICAL engineering matters in the iron and steel field were made the subject of a meeting last week in Chicago. The topics included heat economy progress in steel mills, sheet rolling, making nickel steel plate, depreciation and obsolescence, non-ferrous bearing metals, steel mill lubrication, hot blast cupolas and the position of the German iron and steel industry. The meeting was held under the direction of the iron and steel division of the American Society of Mechanical Engineers and under the auspices of the Chicago section of the society. The technical sessions took place at the Palmer House, Chicago, on Nov. 14 and 15, and simultaneous visits were arranged on the afternoon of Nov. 15 to the Gary Works and the South Chicago Works of the Illinois Steel Co., the Inland Steel Co. and the Acme Steel Co. The attendance was close to 200, many representing the Chicago district.

Those particularly responsible for the meeting, which served to typify the plans of the new division of the society to devote itself to iron and steel mechanical engineering, were George T. Snyder, chief engineer National Tube Co., Lorain, Ohio, and chairman of the division; Rogers A. Fiske, Western editor THE IRON AGE and chairman of the technical program, and P. T. Wetter of the staff of the society.

The technical contributions were presented at three day sessions and at a dinner on Wednesday evening. The presiding officers were John W. Shepherdson, chief engineer Morgan Construction Co., Worcester, Mass.; J. Fred Mowat, chief engineer, Joliet Works, Illinois Steel Co., Joliet, Ill.; A. J. Boynton, vice-president H. A. Brassert & Co., consulting engineers, Chicago, and Senator James E. MacMurray, chairman Acme Steel Co., Chicago, who officiated at the dinner. Owing to the limits of space, only the part of the report of the meeting that covers sheet rolling can be given in this issue, leaving the various other topics for subsequent numbers.

Pays Tribute to Sheet Steel Industry

SHEET rolling elicited several written discussions. The paper on the subject was an adverse criticism, by Leon Cammen of the staff of the society, of existing practice in this country and abroad. "An analysis of its present development," said he, "would give it [industry] a mentality of 12 years as applied to steel and probably around eight or nine years as applied to copper and brass." He termed the wide

strip mill as more or less a speculation, that "as it is the finishing of the sheet that constitutes the major part of the cost, it is perfectly possible that a new method of operation will be developed and that the wide strip mill will become obsolete before it [has] had a chance to pay for itself."

Mr. Shepherdson, chairman of the session, disagreed with the author's designation of the mentality equivalent of the sheet rolling industry. He is convinced, he added, that the hot rolling of thin gages in wide widths has been a problem and continues to be a problem to tax the wisest and most experienced rolling mill men. Any method of manufacturing a product, he continued, has its limitations. "For instance, the Garrett type of rod mill is limited to a small rod bundle around 180 lb. Any rod mill is ill adapted except under unusual circumstances to roll smaller than No. 5 rod. Beyond that point it is generally cheaper to cold draw.

"In the days of three-high sheet-bar mills, sheet bar was regarded the lightest section suitable for rolling on such mills. The continuous sheet bar mill installed at the plant of the Youngstown Sheet & Tube Co. some 23 years ago merely rolled this product for the first time from a whole 6500-lb. bloom direct from the ingot heat and fitted into the scheme of the then prevailing and, for that matter, now prevailing system of sheet rolling.

Finishing in Continuous Sheet Mill

"The transition now in course of evolution is to carry a semi-finished intermediate product down to lighter gages, at higher speeds, but up to the present no attempt is being made to do this from the initial heat of the ingot or in weight of slab corresponding to the whole ingot. The difficulties are well recognized: speed, high tonnage per minute, heavy torques mean power, and power beyond all previous concentration is being put into small rolls. New metal in the rolls is required of sufficient endurance to withstand the localized surface pressures. These new rolls could not come overnight. The American sheet mill industry, far from showing temerity, has plunged into a new process pretty much regardless of cost, allured by the potential advantages in sight. This was no twelve year old boy's job."

Daniel Eppelsheimer, vice-president American Rolling Mill Co., Middletown, Ohio, pointed out that in discussing the economic importance of the new process of rolling mention

should be made of the developments in the finishing department that must be followed. "It must be evident," said he, "that new and advanced modes of pickling, annealing, cold rolling and coating are of necessity employed in order to gain full benefit from the higher production of the continuous rolling."

He emphasized that the control of the shape of the rolls in successive stands of a tandem or continuous mill involves much more than the original turning of the rolls and heating of them by the piece. The shape between the rolls when the piece is being engaged is the critical thing and it must be appreciated that this is affected by a large number of factors ranging all the way from the rigidity of the mill housings to the character of lubrication of the roll necks or bearings.

"There are a number of problems other than those mentioned in the paper," added Mr. Eppelsheimer, "which required solution in order to substitute mechanical operation for the high degree of skill required by the hand rollers of the past. I believe that a full understanding of them would convince the members of this society that Mr. Cammen has underestimated the difficulty of replacing the particular manual operations involved by a series of mechanical devices."

He went on to say that in the Ashland process the shape of the rolls when in engagement with the piece is deformed from the truly cylindrical and the shape in each stand is less deformed than the preceding one. This process of rolling wide, thin metal, he added, is used not only at Ashland, but at Butler, Pa., and Middletown and by licensees of the American Rolling Mill Co. at Weirton and will be used shortly at Wheeling. It has, he suggested, a much wider application than the author of the paper apprehends.

"Those members of this society who visited Ashland," he continued, "will recall that the continuous pack rolling units of the mill installation are planned to operate in parallel with each other, as well as in series with the continuous roughing mill, and I may add that our experience indicates that it is fully practical to provide continuous or tandem finishing mills, operating always according to the deformation process, noted by the writer, for reducing sheet metal to any desired gage with large attendant economies."

The patent situation was discussed by the author, who said continuous sheet rolling, not a new art at all, is literally plastered with patents. Mr.

Eppelsheimer in referring to the subject said: "I have had personal connection with the development of the patent situation of the American Rolling Mill Co. and have attempted to keep informed on the patent situation in general. To my mind there is no basis for a fear that rival concerns are on the way to, or are even unconsciously drifting into, the position of interfering with each other by means of trivial patents. The entire situation was, as I believe, so completely worked out by the American Rolling Mill Co. before the industry became convinced of the practical importance thereof that there is but little room so far as this development is concerned for the automobile or radio situation to be repeated."

Increased Output of Conventional Mills

R. J. Wean, vice-president Aetna-Standard Engineering Co., Youngstown, Ohio, said it would be well to give due credit to the accomplishments of those engaged in this great industry, whose total output this year will approach 5,000,000 tons, having an approximate sales value of \$300,000,000 to \$400,000,000. "When it is realized that the sheet and tin plate industry has invested upward of \$75,000,000 in the last two years for the production of tin plate and sheets by new methods and processes, they cannot, in all fairness, be accused of a total lack of progressiveness.

"While it is true that for many years this industry was slow to take up new developments, it must be remembered that this was during a period when profits were ample to satisfy the stockholders and the pressure of low selling prices was not present. In recent years this industry has made tremendous strides in the improvement of the quality of their product, as well as increased production from existing equipment. For many years the sheet industry was largely in the hands of mill men—men who had been trained to roll steel by actual experience. Very little engineering knowledge was applied to the industry as a whole, and this possibly accounts in some measure for their lack of progress, as in recent years the developments that have come into the sheet industry have been brought about by applying engineering effort.

"Strange as it may seem, the introduction and development of wide strip rolling, when used for tin mill breakdown purposes, caused the development of new methods of heating, as well as new methods of finishing this material, that can be applied to any existing conventional type sheet or tin mill. Continuous pack heating furnaces and mechanical catchers for the mills constitute largely these improvements at the present time, and this permits an increased output per mill with a reduced mill crew.

"In past years on full finished or automobile sheets," continued Mr. Wean, "it was general practice for the bars to be roughed down from two to four passes on the roughing

mill and then swung to the finishing mill, where they would be given several additional roughing passes before matching. The pack would then be returned to a sheet furnace for reheating and subsequently finished on the finishing mill.

"When operating in this manner, one crew would operate both the roughing and finishing stands. The result would be that either one of the mills would be idle 30 or 40 per cent of the time and, in many cases, even more. During the past year, what is known as the 'double mill' or 'Tipperary' system has come into quite prominent use, which means that the roughing mills are operated by one crew and the finishing mills by another crew, so that all mills are being operated as nearly 100 per cent of the time as heating and mill conditions will permit.

"To the writer's knowledge as much as 25 to 30 tons of 19-gage sheets 36 in. wide, 78 in. long, rolled three in a pack, were finished on a sheet mill of the above type in 8 hr. When this is compared to the old style production of 9 to 12 tons in 8 hr., it can readily be appreciated what this will mean to the sheet producer in the form of reduced cost, as well as increased tonnage, without the addition of any actual rolling equipment. When all of the economies of this nature have been accomplished in what we will term the conventional type sheet mill, it will be extremely difficult for wide strip steel producers to manufacture at a lower cost than the ordinary sheet mill producers.

"The actual cost today for erecting an 8-stand sheet mill would be approximately \$1,500,000 to \$2,000,000, which represents about \$250,000 per hot mill. This, of course, would include buildings, furnaces and other machinery, without which it would be impossible to operate the mill."

Makes Long, Thin Strips Without Reheating

Lloyd Jones, E. W. Bliss Co., Salem, Ohio, said he could not agree that the wide strip mills have proved a failure. Of the last three wide strip mills to be put in operation, two of them exceeded expectations in thinness of gage and the third is producing within the limits of gage. "It is true that, under the present hot strip practice, No. 12 to No. 16 gage may be considered commercial limits in wide widths, but with the addition of cold rolling these strips can be reduced to any gage desired."

Mr. Jones's idea of the sheet mill of the future is in part as follows: A tandem roughing section and a continuous finishing section. The product of this mill may range from 12 to 36 or 42 in. in width, about 250 ft. in length and from No. 3 maximum to No. 26 minimum in gage. The mill would cover jobbing mill plates and sheets within the width capacity in all gages, sheet mill products within the width capacity and all gages down to No. 26-gage—or probably 75 per cent of the sheet tonnage. As to tin

mill products, the mill would cover No. 18 to No. 22-gage material, which could be doubled and hot rolled on hand mills to light gages. An alternative to this would be cold rolling on cluster or backed-up mills to the desired gage. In conclusion he said: "We have produced hot strips of long length No. 24 gage thick from a hot slab in one rolling without reheating, by a process recently developed."

Marked Improvements in Conventional Rolling

As a part of his contribution to the discussion, H. L. Bodwell, assistant district manager, American Sheet & Tin Plate Co., Vandergrift, Pa., gave a brief description of the present method of rolling light gage sheets to assist in visualizing some of the difficulties involved and to point out the improvements made to improve quality and quantity.

"The size of the rolls," he said, "has increased from 18 or 20 in. in diameter to 30 or 32 in., with corresponding increases in the size and strength of the housings and drives. Methods of heat control of the rolls have been perfected so that variations in temperatures are held within 50 deg. Fahr. in all stages of the rolling operation, with consequent longer life of rolls. Roll breakage is now a rare occurrence and it is usual to obtain a life of roll of 100 days or more before it has to be discarded on account of the entire chill being removed.

"Preheating of rolls is practiced, eliminating the necessity for making a large amount of more or less unsalable warming-up sizes and permitting the immediate rolling of orders, with consequent better deliveries.

"Continuous pair furnaces are used, with less labor in charging and elimination of puddling and with improved quality of pair heating. Mechanical doublers have been introduced, doing away with one of the most difficult jobs. Various mechanical means of handling bars and handling packs into sheet furnaces and at mills have been devised. Working conditions have been improved by installation of water cooled floors, ventilating systems and forced air cooling systems. On the whole, many improvements have been made and the output per mill has been doubled in the last 25 years.

"The standard mill unit consists of a roughing mill, sometimes called the soft mill, with both top and bottom rolls driven, a finishing mill with only the bottom roll driven, the top roll being driven by friction, and the necessary complement of pair and sheet furnaces, shears, doublers, etc.

"The roughing rolls may be steel or gray iron, but usually wornout finishing rolls are utilized. They are kept cold by means of a spray of water. The finishing rolls are of cast iron, with about $\frac{3}{4}$ in. chill, 28 in., 30 in. or 32 in. in diameter, of a length suitable for the ranges in widths to be rolled, varying from 34 in. in length of barrel to 84 in., and

weighing from 8000 to 25,000 lb. They are run hot but kept below about 750 deg. Fahr. by means of steam or air blowers.

"The crew consists of the roller, who is the foreman of the crew and has general charge of all operations on his mill, and these other members: Sheet heater, roller's helper, heater's helper, rougher, catcher, pair heater, pair heater's helper, matcher, doubler, shearman, leader and opener. Additional help is provided as required by reason of excessive weight of bars or other causes.

"The bars are drawn from the pair furnace in pairs and broken down on the soft mill until approximately $\frac{1}{4}$ in. thick. Then they are swung over to the finishing mill, where the roughing is finished, the rougher and catcher doing this work. The two pieces are matched together for length and thickness and the roughing finished in that way.

"After the roughing, the breakdowns are matched and doubled and reheated in the sheet furnace. After

reheating, if 28 or 30 gage, the pack is run over on the finishing mill one pass, then opened, matched and doubled again. The pack now consists of eight sheets and is reheated again in the sheet furnace and finished by the roller in as many passes as necessary to obtain the required length. No. 26 gage is matched in 3's after roughing and doubled into packs of six, then reheated and finished.

Other gages may be rolled either single or double, in 2's, 3's or 4's as may best suit the particular gage and size being rolled. The bars are generally worked in heats of 12 pairs each. Both bars and packs are, at some stage of the process, worked below the critical temperature. As the greater part of the roughing, the run-over and the finishing are done on the one finishing mill, those members of the crew performing each part have ample time to rest. The hot finishing rolls are kept almost constantly in use and are, therefore, kept at a uniform temperature."

Melting speed depends upon the physical character of the charge and the analysis of the steel to be made. Heats already made in the furnace have demonstrated that under ordinary conditions, 600 lb. of steel or base metals (Swedish pig iron and muck bar) can be melted in 50 to 55 min. The container for the metal is a monolithic crucible or a lining tamped in around a core, and acid, basic or neutral refractories may be used. Experiments have disclosed a life of crucibles of 45 heats, but this record may be materially bettered, it is believed, with more constant use.

Advantages claimed for the new method of melting over others are that the stirring motion in the bath causes complete dissemination of the alloys; that, because the heat comes from induction, there is uniform distribution of the temperature throughout the bath; that the steel is made in the absence of oxygen, and of phosphorus and sulphur from fuels; that there is no contact with carbon electrodes, and that the consistent chemical results indicate that the furnace provides a most delicate control over all of the elements contained in the steel.

The furnaces are housed in a new building of brick and steel, called the electric furnace department. It is remarkable for its roominess, lighting and ventilation. Along the wall, opposite to the side on which are located the electric furnaces, are bins for holding the raw materials, and the entire plant is served by a 5-ton overhead electric traveling crane.

Rapid Melting of High-Grade Steel

High-Frequency Electric Induction Furnace at Pittsburgh Melts 600 Pounds in About an Hour

A DEMONSTRATION of a new 600-lb Ajax-Northrup high-frequency induction steel melting furnace, recently placed in operation at the plant of the Heppenstall Forge & Knife Co., Pittsburgh, was held at the plant of that company Friday afternoon, Nov. 16. It attracted some 300 members of the Engineers Society of Western Pennsylvania and the American Society for Steel Treating and others interested in the manufacture of high-grade steel. The visitors saw steel made by a process that is believed to be the first installation of its type in the country to cast steel ingots for production work. In a little more than an hour a charge of cold metal was melted and poured, and neither the melter nor those who stood close to the furnace experienced discomfort because of the temperature of 3000 deg. Fahr. of the molten metal. The shell of the furnace could be touched without danger of burning at any time during the operation, and the radiation of heat is evidently not great even during the periods when the cover of the pot is opened to receive alloy additions.

The high-frequency current is supplied by a 150-kva. motor-generator set, in which the current is transformed from 60 cycles to 960 cycles. This current is passed through a helical copper coil, which surrounds the container of the metal charge. Electromagnetic currents are set up and heating and melting ensue. Because there is no contact between the coil and the charge, induction melting often is referred to as "melting by radio or wireless." The furnace is

the product of the Ajax Electrothermic Corporation, Trenton, N. J.

Pouring Side of a 600-Lb. Ajax-Northrup High-Frequency Furnace

Boring and Drilling Machines for Automotive Use

DIRECT motor drive of the spindles and plate mounting of the spindle bearings in the head are outstanding features of a cylinder boring machine and a valve hole drilling and reaming machine—both of vertical type—which have been brought out by the Shaw Crane-Putnam Machine Co., subsidiary of Manning, Maxwell & Moore, Inc., 100 East Forty-second Street, New York. Except for details of the head, the machines are of the same general design.

In both machines the motor is mounted on the head, close to the tools as shown, and the drive is through chrome-vanadium steel heli-

automatic and manual control is employed. With the automatic feed the head rapidly approaches the work, goes into feed and continues at the predetermined feed until the work has been bored or drilled; it then returns rapidly to the upper position and stops. When the work is changed,

from 31 to 79 in. The work table is 25 x 48 in. and is located 12½ in. above the floor. The spindles of this machine are driven by a 20-hp. constant-speed motor which is controlled by push buttons.

The valve hole drilling machine can have 6, 8, 12 or 16 spindles. The distance from the center of the tool spindle to the column face is 13 in., and the distance between the top of the table and the ends of the spindle may be from 32 to 58 in. The work table, located 10½ in. above the floor, measures 27 x 56 in. A 5-hp. constant-speed motor with push button control is used on this machine.

Machine Knife Makers Are Merged

The A. A. Simonds Co., Dayton, Ohio; the L. & I. J. White Co., Buffalo; the R. J. Dowd Knife Works, Beloit, Wis., and the Worden Tool Co., Cleveland, leading manufacturers of machine knives, have been merged under the name of the Simonds-Worden-White Co. For the present the four plants will be operated as separate units, with general headquarters at

THE Cylinder Boring Machine Is at the Left and the Valve Hole Drilling and Reaming Machine Is Above. The separate plate arrangement of the Timken bearings, which permits changing center distances of spindles by installing new plates and gears in the head, is shown at the right

cal gears. All shafts are mounted in Timken roller bearings and flood lubrication is provided by a geared pump.

Separate plate mounting of the Timken bearings permits changing the center-to-center distances of the spindles by installing new plates and spindle gears in the head, which arrangement is emphasized as eliminating the necessity of applying an entirely new head for various spindle groupings. The outer bearing cups are pressed into the steel plate and the inner cones of the roller bearings are machined directly on the shafts, which are heat treated. Use of these steel plates and the special application of the Timken bearings provides space for unusually large diameter spindles, thus affording strength for maximum speed of operation. The spindles, held rigidly, are practically vibrationless.

Oilgear hydraulic feed with both

this cycle of automatic operation is again started by means of a convenient lever. The hydraulic pump with its 3-hp. motor is mounted on a bracket on top of the column of the machine, which construction minimizes floor space requirements.

The saddle has a narrow guide and taper gibs are provided at both top and bottom to assure accurate alignment. The table and base on both types of machines is made in one casting and the upright is bolted to the base and fitted with key and dowels to assure rigidity. Work tables of various sizes and heights above the floor can be furnished to suit particular requirements.

The cylinder boring machine can be arranged for 4, 6 or 8 spindles. The distance from the center of the tool spindle to the column face of the machine shown is 14½ in., the distance from the spindle ends to the top of the work table may be

Dayton, Ohio. W. E. Bonesteel, who was president-treasurer of the Worden Tool Co., becomes chairman of the board of the new organization and will maintain his office in Cleveland. Herbert R. Simonds is president of the new company and Frank R. Henry is secretary and manager of sales. Both were affiliated with the Simonds company. W. S. Wall of the White company is first vice-president. In addition to the manufacture of machine knives the White company makes edge tools, carpenter tools and saws, and the Simonds company manufactures emery wheels.

Cold Metal Process Co., manufacturer of light gage strip, or shim steel, has moved to larger quarters in the old plant of the Youngstown Boiler & Tank Co., Glenwood and Mahoning Avenues, Youngstown. Beside rolling shim steel, the company has begun to make stampings.

Accuracy of Tools and Work Checked Rapidly

AN amplifying comparator with diamond measuring point and a dial having 0.0001-in. graduations spaced 3/16 in. apart, to facilitate reading, has been placed on the market by the B. C. Ames Co., Waltham, Mass. The instrument is sensitive, accurate and impersonal, and is in-

justable up and down for coarse setting by means of rack and pinion. The head cannot drop and injure the indicator when the binding clamp is loose. A special feature is the lever inclosed in the bracket. This lever serves to hold the indicator contact point and absorb all horizontal stress and strain, thus causing dial readings to repeat positively. It does not affect amplification, the latter being obtained directly from the measuring point through the 0.0001-in. dial gage.

A stop bracket, consisting of a casting and a hardened tool steel stop blade, is adjustable to accommodate

the work in testing position. Stops are provided on the bracket lever to protect the indicator from being jammed or injured.

The platen, of tool steel, hardened, ground and lapped flat, is 5 in. long, 4 in. wide and 1 in. thick, and is movable to prevent local wear. It is mounted on a large adjustable spindle, fitted with a clamp, and is raised and lowered by a knurled screw through worm and gear. Platens of special shape, and V-blocks, can be furnished. The diamond in the measuring point is rounded and will not scratch or mark the work. The height of the amplifying comparator is 16 in. and the weight 70 lb.

Variations of 0.0001 In. Are Amplified to Nearly 3/16 In. In the above set up pistons are being tested to 0.0005-in. limits

tended for use in maintaining size control both on work in process and the tools employed. It will accommodate work up to 8 in. under the measuring point.

The instrument is simple to use. A standard size block, or unit, is placed on the platen under the measuring point and the dial is adjusted so that the pointer comes to rest at zero. After the block is moved away, it is returned a few times to make sure of the adjustment. In testing the work, movement of the dial pointer to one side of zero indicates a minus dimension and to the other side a plus dimension. Ability to repeat readings is an outstanding characteristic claimed, and the most delicate setting can be quickly and securely locked in place. Rigid construction prevents errors due to spring of the instrument.

The micrometer dial gage is of fan shape. Its entire range shows only 0.001 in. plus and 0.001 in. minus, and occupies a sweep of nearly 4 in. The amplification thus secured is emphasized as relieving eye strain, and permits the operator to read down to 0.000025 in. easily and precisely. The minus graduations, at the left of zero, are in red, and those at the right of zero, the plus readings, are in black.

The iron base is heavy, has three-point support and three rubber feet. The column is of solid steel and is bolted against a wide shoulder. The bracket which holds the indicator is of massive design, ribbed and clamps to the column positively. It is ad-

Oil Grooving Machine of Simple Design

SIMPLICITY of design and convenience of operation are features of a self-contained ball-bearing oil groover which has been placed on the market by the Watson Brothers Machine Co., Inc., Bound Brook, N. J. Three sizes can be furnished, one smaller and one larger than the particular machine illustrated, which is for grooving bushings from 3/4 to 6 in. in diameter and up to 6 in. in length. It will also cut barrel cams and score bushings and inserts with endless threads for die castings. Taper attachment can be supplied and the machine can be furnished without legs for bench mounting.

Bushings to be grooved are held in a 6-in. universal chuck or in an air chuck, the spindle of the machine be-

ing hollow and threaded on one end to permit attaching the air chuck. The grooving tool is mounted in a swivel toolpost on a cross-slide on the carriage. Grooves are reproduced by cams, two of which, one single and one double, are furnished. The cam has a clutch within it which provides a double index for grooving on the opposite side of the bearing. By disengaging the carriage and rotating the spindle any number of grooves in a plane perpendicular to the axis can be cut.

The forming cam A, mounted on the rear end of the spindle, gives longitudinal movement to the cutting tool and carriage through a follower, stroke adjustment arm B, connecting link C, slide D and connecting rod E.

Oil Grooves Are Reproduced by Cams, Two of Which Are Furnished. Barrel cams can be cut and bushings and inserts scored with endless threads for die castings. The component parts and action of the machine are shown in view above

The stroke may be adjusted from 0 to 6 in. by the small handwheel on the end of arm *B*. Depth of cut is controlled by the cross feed handle *F*, a depth adjustment and stop being provided at *G*. The spindle and cam are driven by a ¼-hp. motor through spur gears, worm and worm wheel. Control of the motor is by means of a switch at the front of the machine. Spindle speeds of 60, 80 and 120 r.p.m. are obtained by change gears.

To make the machine ready for operation, all that is necessary is a simple adjustment of the stroke arm, depending on the length of the bushing and the setting of the tool. When changing work in the chuck the spindle is disengaged by means of a clutch.

The machine occupies floor space of 20 x 60 in. and the height to the center of the spindle is 41½ in. The net weight is 500 lb.

power the lever returns to idle position, the fingers automatically lock it in place.

Drive of the block spindle is through cast steel gears of the herringbone type. Different speeds may be obtained by changing these gears, or the machine might be built with change-gears that would permit drawing several sizes of wire at the will of the operator, without alteration of the mechanism.

Three horizontal rods seen extending along the front of the bed constitute the means of automatic operation of the electrical device for stopping the machine. Pressure against the uppermost rod, such as would happen were an operator's body to be thrown or to sag against it, operates the drum-switch which shuts off the power. Pulling forward the lower rod starts the motor operating again.

Ball-bearings are used throughout, with positive circulating lubrication. Driven by a Westinghouse line-start motor of 40 hp., the machine is about 15 ft. long and weighs close to 11 tons.

Three-Block Wire-Drawing Frame

Safety Features and a Slip-Clutch Used on New Machine for Production of Drawn Wire

BY JOHN NELSON

TWO devices feature a three-block rod-frame designed and built by the Washburn shops of the Worcester Polytechnic Institute, Worcester, Mass., for the Atlantic Wire Works, Branford, Conn. The essential feature of the machine is the use of a slip-clutch designed by the Washburn

proper degree of acceleration and removes the chance of snapping the wire.

Provision is made for quick overcoming of momentum and bringing the block to rest when power is shut off, by means of a self-energizing brakeshoe operated by a lever, the

shops for wire-drawing purposes. Another important feature is the provision made to guard against injury to the operator. The motor may be stopped by pressing a button, or mechanically through a rod that extends along the front of the bed, and acts to shut off the power, should a man's body fall against it.

The friction clutch is designed to do away with starting strain and possible snapping of the wire. The clutch operates somewhat after the manner of the automobile clutch. It is highly sensitive and, if desired, may be started at a speed even as low as 2 r.p.m. Naturally, the 60 r.p.m. for which the machine is designed, or even a higher speed, is wholly feasible. This particular machine has three blocks, one a two-decker which permits passes of the wire through the medium of a sheave pulley.

Vertical starting levers for the three blocks, seen at the front of the bed, are attached at their lower ends to a shaft which operates fingers that act to slide a sleeve on the main driving shaft. The motion of the sleeve operates the cams which tighten the friction disks, of which there are seven sets of two, one cast iron, the other bronze. An unskillful, sudden movement of the starting lever would start up the block with a jerk. But a sufficiently gradual motion insures the

THREE-Block Machine, Showing at Upper Left the Two-Story Block Designed for Passing Wire Around a Sheave. The other views are of the driving mechanism and the lubricating system

device resembling those used in controlling talking-machine disks.

Each vertical lever which operates the clutch has a safety device which insures that it will remain in its neutral position. It is held between two fingers, the left one of which must be snapped back before the lever may be moved. When with the shutting off of

Reducing Varieties of Welded Chain

WASHINGTON, Nov. 19.—Approval of a simplified practice recommendation for welded chain was given at a general conference of manufacturers, distributors and users at a meeting held at the Department of Commerce under the auspices of the division of simplified practice last week. The program will become effective for new production on Feb. 1, 1929, while the distributors will have until May 1,

1929, to use up present stocks. R. L. Lockwood of the division, who represented the department at the conference, pointed out that, after a careful study and survey of production and demand covering all regularly catalogued items, it was found that two-thirds of such items would amply satisfy all normal demand.

Two-Ton Hydraulic Broaching Press

A NEW 2-ton hydraulic press with maximum stroke of 14½ in., for broaching, assembling, arbor pressing and other operations, has been brought out by the American Broach & Machine Co., Ann Arbor, Mich. The machine is self-contained and can be furnished either for belt or motor drive.

The ram, which is 2 in. in diameter and is tapped at the end to receive

Work Up to 10¼ In. in Diameter Can Be Handled on the Table. The stroke of the ram is adjustable up to 14½ in.

attachments for pushing, has a speed of 14 ft. per min. The stroke is adjustable up to the maximum, 14½ in. The work table has a 2¾-in. hole central with the ram and at the front has a notch which can be cut through, if desired, to facilitate removing assembled parts. The finished working surface of the table is 8 in. in diameter and the offset in the frame of the machine permits handling of work up to 10¼ in. in diameter.

Control of the machine is either by hand lever or foot pedal and the arrangement is such that upon release of either lever the ram returns automatically to the upper, or starting position.

A 5-gal. oil reservoir is contained in the base of the machine. The pump is of continuous-flow type and control of the action of the ram is by means of a balanced piston valve. The hydraulic cylinder is 4 in. in diameter and is of gray iron; the piston is of conventional type using step joint rings and one leather cup. Oil is delivered to the full area of the piston on its downward stroke and to the lower end of the cylinder on the return stroke. The up-stroke of the ram is 25 per cent faster than the down-stroke.

For motor drive a 2-hp. 1800-r.p.m. motor is recommended. Lubricating pump and lubricant receptacle can be furnished. The machine is available for bench mounting as well as with the pedestal, the former weighing 580 lb. and the latter 800 lb.

Motor-Driven Mechanism for Operating Valves

A MOTOR-DRIVEN valve-operating unit is being put out by the Cutler-Hammer Mfg. Co., Milwaukee, which makes possible automatic operation of all valves up to 6 in. Although so small that it can be held in one hand, this unit has a rating of 15 lb.-ft. It can be actuated automatically by float switches, temperature controlling devices, pressure regulators, etc., or by push buttons.

This unit is similar in principle to the standard C-H "Dean" operating unit. While designed primarily for valve-operating service in industries where regulation of pressures and temperatures of gases and fluids is

Valve Mechanism Designed for a Wide Variety of Services

necessary, it is likewise adaptable to many miscellaneous applications, such as operating skylights, awnings, radiators, doors, etc.

New Flexible Coupling

A NEW flexible coupling brought out by the Morse Chain Co., Ithaca, N. Y., consists primarily of a

Efficiency, Durability and Simplicity Are Claimed for This Coupling

Morse chain wrapping two sprockets, each one-half the width of chain. One sprocket has a guide groove in center of face to hold the chain in place; the other has no guide groove and is free to float under the chain. The chain fits loosely enough on the sprockets to take care of ordinary misalignment and lack of parallelism. High efficiency, durability and simplicity are claimed for this coupling.

Welding Set for Direct Current Circuits

A 200-AMP. welding set containing many new features in design and construction has been placed on the market by the Westinghouse Electric

Starting Rheostat, with Low-Voltage Protection, Is in Cabinet on Top

& Mfg. Co., East Pittsburgh. It has particular application in shops where only direct current is available for the driving motor of the welding set. It is designed so that either a 230 or 550-volt driving motor may be used. The construction permits use either as a portable or stationary unit.

Driving motor and generator have a common frame and common shaft, supported by ball bearings. The control, mounted on top as a part of the frame, is protected by a sheet steel cabinet. Three wheels on roller bearings make the set readily portable and give the welder small overall dimensions and a low center of gravity. For stationary use the running gear can be omitted.

Rating of the unit, in accordance with the N.E.M.A. standards of practice, is 200 amp., 1 hr., 50 deg. C. rise in a resistance load at 25 volts. The welding range is 60 to 300 amp. The compound-wound driving motor maintains constant speed with a voltage fluctuation of not more than 10 per cent. The motor starting rheostat with low-voltage protection is inclosed and mounted in the sheet steel cabinet on top of the set.

Richard A. Feiss, Inc., Boston, engaged in specialized consulting service in management, organization and merchandising, has removed its offices to 470 Atlantic Avenue.

European Steel Conditions Improving

German Lockout Finds Ample Stocks—British and French Makers Getting Better Tonnage—Conversion of Steel in Transit

(By Cablegram)

LONDON, ENGLAND, Nov. 19.

DEMAND for Cleveland pig iron is improving, mainly as a result of increasing domestic requirements. Consumers are buying more freely and withdrawals from makers' stocks are the largest for many months.

Hematite supplies are almost negligible, and some furnaces already are in arrears with deliveries. Prices are stiffening. Foreign ore is quiet.

Rolled iron and steel markets are moderately active in semi-finished and light-weight material, owing to the German lockout. But plants making heavy material are still badly in need of orders.

Tin plate inquiry is improving, although business still is slow. Makers are well placed for the early months of next year, but there is a shortage of orders for the remainder of the current year, and output is now below 70 per cent of capacity. All classes of wasters are now scheduled, at prices fixed at from 15s. to 16s. 9d. (\$3.64 to \$4.07) f.o.b. works port, according to specifications.

Galvanized sheets are in more active demand and prices are steadier. Black sheets are generally quiet.

On the Continent of Europe

Continental markets are less excited over German developments, and prices are easing. Further declines are an-

ticipated if the lockout ends soon, as German supplies are ample and the Steel Works Association has authorized the release of certain quantities for export.

Moscow is to build an underground railroad (subway) at a cost of R. 55,000,000. [At 1913 rates of exchange, this would have represented about \$28,325,000.]

German Lockout Threatens to Spread

Suspension of Steel Output, However, Will Have No Immediate Effect on Manufacturing Consumers

BERLIN, GERMANY, Nov. 7.—The lockout of 225,000 men employed in the Northwestern iron and steel industries has been under way since Nov. 1. The area involved normally produces 80 per cent of Germany's heavy iron and steel as well as a large part of the country's finished products. Virtually all producers in this section have entirely ceased operations. The wage dispute threatens to spread to other areas, such as Solingen and Hagen-Schwelm, with the possibility that an additional 100,000 men will be thrown out of work.

The original dispute, in the "Northwestern group," began with a denunciation of the existing wage agreement by the employees, followed by a demand for a wage increase of 15 pfennigs an hour for all workers over 21 years of age. The employers offered certain minor wage advances, affecting a few thousand men, and

gave notice of a lockout, to begin Nov. 1. An arbitrator appointed by the Government awarded an advance of 6 pfennigs an hour for time workers, which would have raised the hourly wage rate from 78 to 84 pfennigs, and an advance of 2 pfennigs an hour to the "time supplement" received by piece workers. The piece workers predominate in the heavy branches, time workers in the manufacturing branches. The increase to the piece workers, on basis of a 48-hr. week, would have been less than 25c. a week.

The employees accepted the arbitrator's decision, but the employers rejected it. The Minister of Labor, Herr Wissell, a Socialist, thereupon declared the arbitration decision binding on both parties, under a clause of an ordinance of 1923 that gives the Government such power. The employers on two different grounds declared the minister's action invalid

and illegal, brought a suit in a court of law to obtain a judicial review of the case, and closed down their works.

A court decision on the disputed point cannot be given before the middle of the month. No further official efforts have been made to terminate the dispute, but the question has been up before the Prussian Diet, and both parties have declared themselves ready to negotiate. The lockout may last for weeks, but may terminate any day. Both sides have sizable "war chests."

The lockout so far has had little effect upon manufacturing outside the district involved. The Stahlwerksverband has ceased booking home and export orders, but has not stopped deliveries against old orders. The Pig Iron Syndicate has taken no action whatever. Prices have not been changed, and it is expected that the usual monthly syndicate meetings that fix prices and selling conditions will not be held until the dispute is settled. Deliveries of scrap have ceased, and ore orders from abroad have been countermanded except in the case of ore already under way. Domestic manufacturers are not threatened with an immediate shortage of materials. Considerable stocks are in the hands of producers and traders. Manufacturers of small metalware

have for some time past been producing largely for stock, and will therefore suffer little should material run short. Should the lockout, contrary to expectations, last a long time, the home market will have to depend upon imports. South Germany will be supplied by the Saar; but it is doubtful whether the French and Belgian works, which before the lockout had abundant work and which will obtain further orders owing to the cessation of German exports, will desire to supply the German market. As a result of the lockout the Belgian market, which showed slight weakness at the end of October, is again firm, and the price tendency is slightly upward.

Until the lockout terminates, Germany will be eliminated from the international market, so far as exports of heavy iron and steel are concerned. Her net exports in this branch in September were 304,000 tons, against 101,000 tons in January and a monthly average of 137,000 tons in 1927. Her production of iron and steel, which this year promised to be only a little behind that of the boom year 1927, will suffer materially. Exports of machinery are not likely to decline unless the lockout lasts a long time. Engineering firms announce that they will continue to execute all orders promptly.

rates are higher in Germany. The exporter in such a transaction pays interest on the cost of converting the wire rods into wire for from 30 to 60 days, but the extra profit more than compensates for this expense. At present there is an active demand upon mills near the German frontier and on the way to a port, and the volume of such business is increasing rapidly. The problem is proving a serious one to the German syndicates and producers, and no solution has been found.

Britain Looking to Continent for Steel Outlet

LONDON, ENGLAND, Nov. 9.—Chief interest in the British iron and steel trade has centered in the turn of events on the Continent, and in particular the German lockout. So far no real effects of the lockout have been felt, except that in certain cases the supplies of raw material have been curtailed, but as most of this material has been coming from Belgium, France and Luxemburg, this stoppage is not very important.

What is looked for, however, is the chance of exporting to Germany. It is this possibility that is focusing the attention of British makers, especially of those engaged in the manufacture of heavy material for shipbuilding and allied trades.

In the meantime business generally in this country continues small. Producers of heavy rolled steel are struggling to secure sufficient orders to keep their plants regularly employed, but some of the mills rolling lighter material are not in such an unfavorable position. Orders coming in for pig iron are meager, except for some brands of hematite, which have been selling well, especially to Italy. Cleveland pig iron is quiet generally. Local steel works are absorbing the restricted output, and any material improvement in the demand would undoubtedly force the lighting of additional blast furnaces. At the moment, however, consumers show little inclination to purchase other than on a hand-to-mouth basis.

German-Austrian Coke-Ore Contract to Be Revised

WASHINGTON, Nov. 19.—Since the German-Austrian coke and iron ore exchange contract has lost most of its significance, as a result of changed business conditions during the past two or three months, the United Steel Works of Germany has begun negotiations looking to the preparation of a new contract, according to James E. Wallis, Jr., American trade commissioner at Berlin. The present contract, made between the German company and the Alpine Mining Co. of Austria, provided that the former was to deliver 240,000 tons of coke a year and the Alpine company 120,000 tons of ore a year.

Figures given out by the German

European Exporters Convert in Transit

Make Greater Profits by Buying Semi-Finished Steel in Germany for Conversion in Other Countries

BREMEN, GERMANY, Nov. 3.—Conversion of material in transit on an international scale is a recent European development that is causing some uneasiness among German manufacturers of bolts, nuts, screws, wire and heavy hardware. Wages paid in these plants are slightly higher in Germany than in most of the surrounding countries, such as France, Belgium, Luxemburg, the Saar, Poland and Czechoslovakia. In addition, the German syndicates control prices, so that concessions, even for export, are seldom permitted. As a result, exporters at Hamburg, London, Rotterdam and other large centers of the export trade have been buying raw materials or semi-finished material in Germany, which they ship to a neighboring country, where the cost of conversion is less than at a German mill, and then export to the foreign market where the finished product has been purchased.

When the material is intended for shipment to an overseas consumer, the semi-finished steel is shipped to a mill in Belgium, the Saar or Luxemburg, from whence it can continue in the form of the product required to the port of Antwerp. If the order is from a buyer in Southeastern Europe, a mill in Czechoslovakia may be selected, and, when intended for ultimate use in a Scandinavian country, a Polish mill receives the order and the German semi-finished material.

In the case of wire rods the domestic prices in all European countries are considerably higher than the export market, so that by buying the rods in Germany and shipping them to another country to be drawn into wire, there is a considerable saving. While a duty is paid on the material when it is shipped into another country from Germany, when it is re-exported the owner of the material receives the refund.

One example of this new trade may serve as an illustration. An exporter in London sells 500 tons of galvanized wire f.o.b. Argentine port at a base price of £9 12s. 6d. (\$46.78) per ton. By the new method of having material converted in transit, the exporter buys 505 tons of wire rods in Germany at £6 2s. 6d. (\$29.77) per ton, delivered at a Belgian mill, where it can be converted under present market conditions at £2 7s 6d. to £2 10s. (\$11.54 to \$12.15) per ton, which brings the cost to a maximum of £8 12s. 6d. (\$41.92) per ton. To this must be added about 7s. 6d. (\$1.82) per ton for transportation, making the total cost, f.o.b. the Argentine port, £9 (\$43.74) per ton—a profit to the exporter of 12s. 6d. (\$3.04) per ton.

No German mill could convert these wire rods into galvanized wire at the low prices of Belgian and other foreign mills, as wages, as well as taxes, social charges and railroad freight

statistical office show that the result of the agreement was a strong revival of the German coke trade with Austria. Sales of German coke to Austria increased from a monthly average of 8400 tons during the first quarter of 1927 to an average of 40,700 tons a month during the last quarter of that year. This figure exceeded the monthly average for the first quarter of 1928, which was 32,500 tons. During the April-August period the high-

est monthly total was 19,894 tons, in July.

Beginning with the third quarter of 1927 imports of iron ore into Germany from Austria averaged something over 10,000 tons a month and remained approximately at this level through May, 1928, but dropped to 4310 tons in June, 442 tons in July and only 70 tons in August, the latest month on which a report has been made public.

French Export Trade Good

Domestic Market Quiet Following Heavy Buying in October —Luxemburg Adds to Pig Iron Capacity

PARIS, FRANCE, Nov. 5.—Probably as a result of heavy buying in October, in expectation of a further price increase, the iron and steel market here has been quieter in the past few days. Domestic consumption of pig iron has been good, but sellers admit that competition of British foundry iron has necessitated special quotations to consumers near the Coast. Pig iron output in Luxemburg is large, with furnaces increasing their production. Export orders for steel products and semi-finished material are sizable, and rolling stock manufacturers report some desirable business from other European countries, one such contract being for four locomotives burning shale oil, bought from Societe Corpet Louvet et Cie. at La Courneuve by the Esthonian railroads. This is understood to be the first part of a program that calls for the purchase of 60 locomotives.

Illegal export of iron and steel scrap continues to be a much discussed subject in the steel industry and Government circles. Despite efforts of the Government to prevent exports of old material needed by French producers, old rails and ships to be dismantled for their scrap have been sold out of the country, so that a revision of the present regulations on scrap exports is expected.

Pig Iron.—The hematite iron market is unchanged, except that tonnages are still being sold as semi-phosphoric iron to be used for mixture, taking a lower price than is openly quoted for hematite. In Luxemburg the Acieries Reunies de Burbach-Eich-Dudelange is replacing its six blast furnaces with three new furnaces having the same total capacity. Other large producers are following a similar program of modernization. The Ougree-Marihayé works is remodeling its furnaces at the Rodange works to produce a total of 400 tons of pig iron a day instead of 180 tons. Improvements are being made at the Differdange works and the Rumelange plant, closed since the war, is to resume operations. Increased pig iron output with modern equipment is expected to reduce costs considerably.

Semi-Finished Material.—Export business continues good, and prices

are firm at £5 2s. (\$24.78) per ton for billets.

Finished Products.—Domestic business is smaller than early in October, but prices are firm and deliveries on most products range from three to six months. Export quotations are strong, and a good volume of trade is reported by most mills. Merchant steel bars for export are quoted at about £6 3s. per ton (1.35c. per lb.), f.o.b. Antwerp. In the Eastern domestic market, merchant bars are maintained at 740 to 750 fr. per ton (1.30c. to 1.32c. per lb.). Special shapes range from 950 fr. per ton (1.60c. per lb.) to as much as 1200 fr. per ton (2.12c. per lb.), f.o.b. mill. The sheet market is substantially unchanged except for a slight tendency to advance prices quoted on light-gage sheets.

Lockout Does Not Affect All German Steel Producers

HAMBURG, GERMANY, Nov. 3.—The lockout in the German steel industry does not affect all producers. On Nov. 3, about one-third of the pig iron producers, 28 per cent of the steel ingot producers and 37 per cent of the makers of finished products were in operation. The lockout, however, is general in the Ruhr, districts excluded being the left bank of the Rhine, the Eastern Valley in Westphalia and all of the industry in Silesia, Saxony and Central Germany.

Duffield Process for Direct Conversion From Ore

LONDON, ENGLAND, Nov. 9.—An interesting sidelight was thrown upon the Duffield process for producing iron and steel direct from the ore at a recent meeting of the Duffield Iron Corporation. C. E. Stearns, the chairman, remarked that the iron resources in the locality of the works (Adderbury, Oxfordshire, England) are sufficient to supplant imported iron ore, to offset importations of unfinished iron and steel into this country and to cover the total iron and steel requirements of England for generations, if worked and fabricated with

plants especially adapted to the physical conditions of the ore and the general circumstances of the locality.

Average analysis of the ore face showed 36.7 per cent iron, the bottom seam being carbonate ore, lean in iron, and this would not be worked. There was estimated to be 1,000,000 tons on the property, available for being readily mined. The designed capacity of the plant now being erected is from 350 to 500 tons a week.

It is expected that a unit of iron will cost $\frac{3}{4}$ d.; in the case of Oxford and Northampton ore, delivered at the blast furnace in Wales and Middlesbrough, in accordance with general practice, the cost is $4\frac{3}{4}$ d. per unit. The difference is over 30s. (\$7.30) a ton, apart from the economics of the process. The Duffield process is designed to use bituminous black coal costing from 10s. to 12s. (\$2.40 to \$2.90) a ton, as against coke at from 20s. to 30s. (\$4.85 to \$7.30). Iron purer than ordinary pig iron may be produced at 32s. 6d. (\$7.90) a ton, and steel ingots at 50s. (\$12.15). This process, if developed, may mean a radical cheapening in the costs of iron and steel production in Great Britain.

German Iron Mines Suspend Operations

HAMBURG, GERMANY, Nov. 3.—It is generally accepted that before long the last of the German iron mines will have been closed. General suspension was contemplated in 1927, but the protracted strike at the mines in Sweden enabled the German producers to continue operation. Shipments of iron ore from Sweden have been resumed at a normal rate, and the two large steel corporations, Friedrich Krupp A. G., Essen, and the Vereinigte Stahlwerke A. G., Düsseldorf, have suspended operation of their Siegerland mines, which have been producing about 40 per cent of the total German iron ore output of about 5,000,000 tons annually. Other mines are expected to close, as the German iron ore is rather poor and well under the surface and the mines are subject to a large influx of water. The total German output has represented about 25 per cent of the country's consumption.

Sharp Drop in Mechanical Stoker Sales

WASHINGTON, Nov. 17.—Mechanical stokers to the number of 100, with 27,219 hp., were sold in October, against 161 with 65,060 hp. in September, according to the Department of Commerce. For the 10 months ended October, sales totaled 1272 stokers, with 428,537 hp., compared with 1224 units with 434,445 hp. for the corresponding period of last year. The October rating was the lowest since January, but was almost identical with October, 1927.

Fabricated Structural Steel

Awards of 47,300 Tons Include Large Plate Tonnages— Only 12,000 Tons in New Projects

WITH 12,000 tons of plates in a group of oil storage tanks at Houston, Tex., and 10,000 tons in a municipal water line at Philadelphia, fabricated structural awards reported in the last week totaled nearly 47,300 tons. A group of buildings for the A. M. Byers Co. at Pittsburgh took 4000 tons, a Cleveland hospital 3000 tons, and a brass and copper mill at Cleveland 3000 tons. New projects, calling for only 12,000 tons, included no jobs of outstanding size. Awards follow:

BROOKLYN, 1560 tons, apartment building, Garfield Place, to Hedden Iron Construction Co.

NEW YORK, 900 tons, office building, Thirty-sixth Street and Fifth Avenue, to Taylor-Fichter Steel Construction Co.

NEW YORK, 515 tons, apartment building on East Twentieth Street, to A. E. Norton, Inc.

NEW YORK, 200 tons, subway station work for city, to Harris Structural Steel Co.

NEW YORK, 132 tons, float bridge and gallows for Reading Co. at Port Richmond, to Bethlehem Steel Co.

WHITE PLAINS, N. Y., 360 tons, People's National Bank Building, to Hay Foundry & Iron Works.

PHILADELPHIA 1000 tons, Philadelphia General Hospital, to McClintic-Marshall Co.

PHILADELPHIA 10,000 tons, municipal water line of seven miles of 6-ft. and 8-ft. riveted pipe, to Witt-Humphrey Steel Co., Greensburg, Pa.

PHILADELPHIA 500 tons, store, offices and garage building at Chestnut and Twenty-first Streets, to Bethlehem Fabricators, Inc.

PHILADELPHIA 2200 tons, plant for United States Gypsum Co., to American Bridge Co.

CAMDEN, N. J., 440 tons, sheet steel piling for City Hall and annex to County Court House; 220 tons to Jones & Laughlin Steel Corporation and 220 tons to Bethlehem Steel Co.

WASHINGTON, 2600 tons, Government Printing Building, to Lehigh Structural Steel Co.

DISTRICT OF COLUMBIA, 300 tons, highway bridges, to unnamed fabricator.

DURHAM, N. C., 258 tons, building for Duke University, to Virginia Bridge & Iron Co.

BIRMINGHAM, 200 tons, addition to American Cast Iron Pipe plant, to Southern Steel Works Co.

NEW ORLEANS, 175 tons, Y. M. C. A. gymnasium, to unnamed local fabricator.

HOUSTON, TEX., 12,000 tons, oil storage tanks for Roxana Petroleum Corporation, to Chicago Bridge & Iron Works.

PITTSBURGH, 4000 tons, buildings for A. M. Byers Co., to Fort Pitt Bridge Works.

CLEVELAND, 3000 tons, new plant for Chase Brass & Copper Co., to Austin Co.

CLEVELAND, 3000 tons, University Hospital group, to McClintic-Marshall Co.

DETROIT, 1900 tons, building for Murray Corporation, to Mahon Structural Steel Co.

CHICAGO, 100 tons, building for Illinois Tool Works, to New City Iron Works, local.

CHICAGO, 500 tons, store on South State Street, to American Bridge Co.

CHICAGO, 280 tons, McCrory store, to Duffin Iron Co., local.

HARVEY, ILL., 500 tons, building for Buda Co., to American Bridge Co.

HERMANN, MO., 1800 tons, bridge across Missouri River, to Kansas City Structural Steel Co.

SAN FRANCISCO, 185 tons plates, 20-in.

shore pipe, United States Engineers' Office, to Pacific Coast Engineering Co.

HONOLULU, 456 tons, plates and shapes, two barges for Inter-Island Steam Navigation Co., to Bethlehem Shipbuilding Corporation, San Francisco.

SAN FRANCISCO, 110 tons, plates and shapes, steel barge for unnamed interest, to Bethlehem Shipbuilding Corporation.

OAKLAND, CAL., 103 tons, factory on Cotton Street, to California Steel Co.

LOS ANGELES, 800 tons, plates, two 134,000-bbl. oil storage tanks for General Petroleum Corporation, to Western Pipe & Steel Co.

LOS ANGELES, 370 tons, plates, 40-in. welded pipe for city, to Llewellyn Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON & MAINE RAILROAD, 2100 tons, 24 bridges.

Railroad Equipment

Orders for 800 Freight Cars— Wabash to Buy 55 Locomotives

ORDERS for freight cars placed during the week included 500 box cars for the Chicago Great Western and 300 ore cars for the Great Northern. Among the larger inquiries were 200 ballast cars for the Chicago & North Western, 500 hopper cars for the Boston & Maine and 200 tank cars for an Oklahoma oil company. The Wabash is soon expected to enter the market for 55 locomotives and the Chicago & North Western for 10. Details of the week's business follow:

Great Northern has ordered 300 ore cars from Standard Steel Car Co.

Chicago Great Western has ordered 500 box cars from Pullman Car & Mfg. Corporation.

Northwestern Pacific has purchased five motor and five trailer coaches from St. Louis Car Co.

Chicago & North Western is inquiring for 200 50-ton steel ballast cars, in addition to 300 flat and 25 hopper cars under negotiation. This road is also expected to make inquiry for 10 locomotives.

Fruit Growers Express is inquiring for 50 underframes for refrigerator cars.

Armour Car Lines, Chicago, are inquiring for 500 refrigerator car underframes.

Boston & Maine contemplates purchasing 500 70-ton hopper cars.

Imperial Oil Refining Co., Tulsa, Okla., is inquiring for 200 tank cars.

Nevada Consolidated Copper Co. has ordered 20 Ingoldsby-type ore cars from Koppel Industrial Car & Equipment Co.

Chicago, Rock Island & Pacific is in market for 50 steel cap caboose cars and two parlor cars.

BOSTON, 300 tons, freight house for New York, New Haven & Hartford Railroad.

WESTCHESTER, COUNTY, N. Y., 150 tons, highway bridge.

ORANGE, N. J., 1000 tons, Memorial Hospital.

ELIZABETH, N. J., 2500 tons, manufacturing building; Turner Construction Co., general contractor.

NORRISTOWN, PA., 500 tons, Montgomery County Court House; Golder Construction Co., Philadelphia, and Henry A. Batton, Philadelphia, low bidders on alternate specifications.

WILLIAMSBURG, VA., 600 tons, building for Williamsburg College.

WASHINGTON, 350 tons, produce stores for Pennsylvania Railroad.

SAN ANTONIO, TEX., 200 tons, Gross Building.

ROSITA, MEX., 1000 tons, building for American Smelting & Refining Co.

CLEVELAND, 200 tons, bridge for Cleveland Union Terminals Co.

CHICAGO, 280 tons, store building on Milwaukee Avenue.

DELTON, WIS., 280 tons, State highway bridge across Wisconsin River; bids on general contract close Nov. 27.

SEATTLE, 550 tons plates, 24-in. pipe line; bids opened.

SEATTLE, 425 tons, sawmill for Weyerhaeuser Lumber Co.; bids being taken.

VANCOUVER, B. C., 125 tons plates, 18-in. pipe line; bids Dec. 11.

SAN FRANCISCO, 1500 tons, apartment building, Sacramento and Gough Streets; bids to be taken next week.

Wabash Railroad is preparing specifications for 55 locomotives.

Reinforcing Steel

Awards and Inquiries Decline Sharply

AWARDS of less than 2600 tons represented one of the lowest totals of the year, while new projects amounted to only 650 tons. Awards follow:

MILWAUKEE, 800 tons, Catholic school, to American System of Reinforcing.

MILWAUKEE, 500 tons, Cudahy apartment building, to American System of Reinforcing.

EVANSTON, ILL., 110 tons, cafeteria, to Concrete Steel Co.

CHICAGO, 600 tons, building for Stewart-Warner Speedometer Corporation, to Barton Spiderweb System.

SACRAMENTO, CAL., 206 tons, highway work in San Diego County, to unnamed interest.

SACRAMENTO, 129 tons, bridge in Orange County, to unnamed interest.

SANTA CRUZ, CAL., 225 tons, hotel, to Truscon Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

CHICAGO, 187 tons, apartment building at 550 Arlington Place.

CHICAGO, 143 tons, apartment building at 515 Briar Place.

CHICAGO, 110 tons, West Hotel at 20 South Des Plaines Street.

CHICAGO, 100 tons, apartment building at 915 Edgecomb Place.

CHICAGO, 100 tons, apartment building at Seventy-second Street and Coles Avenue.

Address on Costs Features Foundry Equipment Meeting

When indirect labor and factory burden equal 5 or 6 per cent of the sales total, a situation has arisen that calls for executive attention, said W. Clement Moore, assistant district manager Wolf & Co., industrial engineers, Philadelphia, in addressing a meeting of the Foundry Equipment Manufacturers Association at New York, Nov. 20. Well managed plants keep this cost down to 3 or 4 per cent, he said.

The successful operation of a plant, Mr. Moore stated, requires that all important facts regarding the business be available every month so that comparisons can be made with previous months, and for the year to date with corresponding periods in previous years. In this way the management can put its finger on conditions that call for correction. Such monthly statements should be prepared for the business as a whole and by departments, and both types of analyses should include the following: Total sales, gross profits, material costs, direct labor costs, indirect labor costs, factory burden, selling and administrative costs and delivery costs.

Despite generally prosperous conditions, he said, there is a surprisingly large mortality among smaller corporations. The number of business failures in October was 200 more than in the same month in 1927. In large part, profits are being made by the larger corporations. Last year \$24,000,000 worth of business was done in this country without a dollar of profit. Out of 452,000 corporations, nearly 45 per cent showed losses. Moreover, out of all the profits made, only 1119 corporations accounted for 33½ per cent. Among manufacturing corporations, 95 out of a total of 89,000 companies made nearly 50 per cent of all the profits.

An important reason for this showing, Mr. Moore said, is that while total business is large there is constant pressure for lower prices. Since high wages constitute one of the mainstays of commodity demand, business must find ways of maintaining a spread between costs and selling prices without reducing wages. This calls for increased efficiency in production and the reduction of waste in administration and marketing. No doubt the necessity for reducing costs has been a prime cause for industrial mergers. In the past two years there have been more consolidations than in any previous 10 years.

Never before has there been such a pressing need for knowing one's business thoroughly. Large corporations maintain research bureaus and statistical organizations. Similar information can be obtained cooperatively in trade associations. Trade bodies should supply their members periodically with data showing average prices and average costs, so that each company may compare its own condition with that of the industry as a

whole. It is always important to know whether one is progressing or not.

The meeting was under the chairmanship of S. C. Vessy, W. W. Sly Mfg. Co., Cleveland, president of the association. A feature of the program was the presentation of a leather and ivory mounted jewel box as a token of appreciation to T. W. Pangborn, Pangborn Corporation, Hagerstown, Md., who was president of the association in 1927. A motion was passed approving a federation of machinery trade associations. A summary of business conditions revealed a favorable situation. The three-month moving average of foundry equipment orders in October, at 211 (100 equals average monthly shipments in 1922, 1923 and 1924), was the highest index ever reached in a record kept since the first quarter of 1925.

Timken Company Increasing Bearings Capacity

The Timken Roller Bearing Co., Canton, Ohio, has announced expansions to its production facilities, which, when completed, will enable the company's output of bearings to be increased from 175,000 daily to 200,000. Work has already been started on various extensions to the bearings factory. The program has called for the expenditure of \$6,000,000 during the current year and has included additions to the steel mill as well as the bearings factory.

Ten-Month Record in Motor Trucks

WASHINGTON, Nov. 20.—Production of motor vehicles in the United States in October totaled 398,818 units, of which 341,705 were passenger cars and 57,113 were trucks, according to the Department of Commerce. Production in September totaled 415,283, of which 358,872 were passenger cars and 56,411 were trucks. Canadian production in October amounted to 18,536, of which 13,016 were passenger cars and 5,520 were trucks, comparing with a total of 21,193 in September, of which 16,572 were passenger cars and 4,621 were trucks.

For the 10 months through October United States production was 3,869,009 vehicles, of which 3,405,942 were passenger cars and 463,067 were trucks. This compares with a production of 3,133,385 for the corresponding period of last year, 2,730,760 units being passenger cars and 402,625 trucks. Canadian production totaled 221,188 during the 10 months of the current year, of which 181,849 were passenger cars and 39,399 were trucks. For the corresponding period of last year Canadian production was 169,331 vehicles, of which 139,420 were passenger cars and 29,911 were trucks.

[United States production for 10 months is fractionally lower than in 1926, when the total was 3,874,574 vehicles, of which 3,446,484 were pas-

senger cars and 428,090 trucks. In trucks the current year has seen the greatest number ever produced in a like period. Except for 1925, production last month was the heaviest in any October.]

Witt-Humphrey Steel Co. Takes Large Pipe Job

The Witt-Humphrey Steel Co., Greensburg, Pa., has received a contract from the Bureau of Water, Philadelphia, for a pipe line consisting of 7 miles of 6-ft. and 8-ft. steel pipe. The contract will require approximately 10,000 tons of 9/16-in. steel plate, which will be riveted at Greensburg and shipped to Philadelphia in 38-ft. sections. The pipe will be protected against corrosion by being dipped vertically in a bath of special refined asphaltum. The company is at present completing an 8-ft. pipe line for the city of Detroit, and will begin making shipments on the Philadelphia job about Jan. 1.

Plan Steel Plant and Ore Exportation in Brazil

The Itabira Iron Ore Co., Ltd., Rio de Janeiro, Brazil, controlled by the Farquhar group headed by Percival Farquhar, 120 Broadway, New York, has obtained a concession from the Brazilian President to export ore deposits at Itabira in the Brazilian State of Minas Geraes. The contract calls for the construction of a steel plant consuming 150,000 tons of ore annually, which will probably be built by a Chicago firm.

The company will reconstruct the Victoria-Minas railroad with an extension to Itabira and a branch line from Colatina to Port Santa Cruz, where extensive equipment will be installed for the handling of ore and coal. It is planned to export from 3,000,000 to 5,000,000 tons of ore annually. Coal for the plant will be imported duty free and the ore will pay a reduced export tax. The concession includes the Itabira Peak, containing approximately 170,000,000 tons of hematite, said to contain 67 to 68 per cent iron. The project will require an expenditure of \$75,000,000.

Continental Can Acquires Wheeling Can Co.

The Continental Can Co., Inc., New York, has acquired the plants, machinery and business of the Wheeling Can Co., Wheeling, W. Va., subsidiary of the Wheeling Steel Corporation. The purchase includes two modern plants in the Wheeling district, manufacturing a diversified line of cans, and conveniently located to tin plate mills. Plants will be operated as before without important changes in policy or personnel and will be used by the Continental company as outlets to the South and Southwest.

Coal Stocks Decline at Steel Plants

WASHINGTON, Nov. 20.—Stocks of coal at by-product coke plants have increased during the past quarter, but the supply on hand at steel works has declined slightly, according to a survey by the Bureau of Mines. Complete returns from the by-product plants showed a total of 5,193,486 tons of coking coal in storage on Oct. 1, of which 1,209,058 tons was low volatile and 3,984,428 tons of high volatile. The steel works and rolling mills reporting had 909,599 tons of steam coal on hand and 586,673 tons of gas coal, a total of 1,496,272 tons. In terms of days' supply, the stocks of low volatile coal on hand at by-product plants on Oct. 1 was 28 and of high volatile 27 against 24 and 25, respectively, on Aug. 1. Steel works had 30 days' supply of gas coal and 32 days' supply of steam coal on hand on Oct. 1 compared with 32 days' and 35 days' supply, respectively, on Aug. 1. On July 1 stocks of coal at by-product plants represented 23 days' supply, while at steel works there were reserves of 38 days' supply. On Oct. 1, 1927, there were 40 days' and 58 days' supply, respectively, the highest on record since Jan. 1, 1919.

The total stocks of bituminous coal in the hands of all consumers on Oct. 1, 1928, amounted to 41,100,000 tons, a decrease of 600,000 tons under supplies on hand Aug. 1, and 20,000,000 tons under the unusually heavy reserves on hand on Oct. 1, 1927.

Larger Shipments of Mining Locomotives

Mining and industrial electric locomotives shipped in the quarter ended Sept. 30 are reported by the Department of Commerce at 141 units, with a value of \$860,305. This is a considerable gain over the preceding quarter, when 111 units were shipped, valued at \$729,458. The total is lower, however, than in any quarter of last year, or than in any of the three latest quarters of 1926. In the September quarter of 1927 shipments were 193 units, valued at \$898,970.

Iron and Steel Movement Into New England

The movement of commodities into and out of New England is shown in a bulletin entitled "The External Trade of New England," just issued by the Department of Commerce and prepared by Robert J. McFall, Domestic Commerce Division. Generally, the period covered is from Feb. 1, 1924 to Jan. 31, 1925. Where data are given for 1926 it is shown there

	Inward	Outward	Net Inward	Net Outward
Iron ore.....	1,534	215	1,319	
Iron, pig and bloom.....	560,780	12,468	548,312	
Rails and fastenings.....	75,214	17,380	57,834	
Bars and sheet iron, structural iron and iron pipe.....	862,665	143,169	719,496	
Other metals, pig, bar and sheet....	396,763	89,564	307,199	
Castings, machinery and boilers....	156,501	289,314		132,813

are no striking changes from the movement for the previous year.

Figures for the iron and steel and related lines are given in the accompanying table stated in net tons.

Record River Movement of Steel from Pittsburgh

The down-river movement of iron and steel products from Pittsburgh district mills last month set a new high record. Shipments on the Ohio River, which are generally recognized as a reliable measure of the movement of these products for consumption beyond the confines of the Pittsburgh district, amounted to 130,808 net tons, the monthly report of the Pittsburgh office, United States Engineers' Corps, discloses. That compares with 125,062 tons in September and 80,423 tons in October last year. For the ten months ended Oct. 31, Ohio River shipments were 1,025,426 tons, or almost double those of the same period last year, when they were 557,927 tons.

Heavy Orders for Foundry Equipment

Foundry equipment orders in October are reported at 182 net, on a basis of 100 as the average monthly shipments for 1922 to 1924. The gross orders of 185 compare with 170 in September and 278 in August. Except for August and last May, they have not been equalled since February, 1927; with that one exception, they are the highest in more than four years. Shipments in October were 254.3 on the same basis. Unfilled orders are reported at 462.6, and the three months' average of gross orders at 211.

Heavier Production of Steel Barrels

WASHINGTON, Nov. 20.—Production of steel barrels in October increased to 656,021, or 56.4 per cent of capacity, against 593,255 barrels, or 50.2 per cent of capacity, in September, according to reports received by the Department of Commerce from 27 companies owning or operating 31 plants. Shipments in October were 661,009 barrels, compared with 595,640 barrels in September, while stocks at the end of each month were 50,071 barrels and 55,059 barrels respectively. Unfilled orders at the end of October for delivery within 30 days totaled 301,782 barrels, against 292,686 barrels at the end of September, while unfilled orders for delivery beyond 30 days were 522,090 barrels and 704,134 barrels respectively. Production during the 10 months ended with October,

1928, totaled 6,283,025 barrels, compared with 5,685,433 barrels for the corresponding period of 1927.

Members of the Steel Barrel Manufacturers Institute shipped 376,998 barrels in October, accounting for a business volume of \$1,143,898. Their plants were occupied to the extent of 58 per cent. I.C.C. capacity was engaged at an average of 40.7 per cent and capacity for light barrels at 63 per cent. Unfilled orders Nov. 1 called for 411,312 units.

By-Product Coke Makes New Record in October

WASHINGTON, Nov. 19.—Production of 4,219,262 net tons of by-product coke in October set a new high record, while the output of 421,000 tons of beehive coke was the largest in any month since last March, and the output of 3,373,806 gross tons of pig iron was the largest since May, 1927, according to the Bureau of Mines. In comparison with September the daily rate of output increased 3.1 per cent for by-product coke, 25 per cent for beehive coke and 6.6 per cent for pig iron. Of the by-product coke produced in October, 3,335,000 tons, or 79 per cent, came from plants associated with blast furnaces and 884,000 tons or 21 per cent came from merchant or other plants.

By-product coke production in the first 10 months has aggregated 39,755,486 tons, a new high record. This exceeds by 2,800,000 tons, or 7.6 per cent, the previous record, made in 1926. Last year 36,774,884 tons was made in 10 months. Beehive coke output, on the other hand, was the smallest in several years, the 10-month total of 3,562,000 tons being less than one-third as much as in 1926 and only 57 per cent of the 1927 output.

Total coke production in 10 months was 43,317,486 tons—less than 1 per cent above last year and over 9 per cent below the high level of 47,661,000 tons reached in 1926.

Cement Production Continues Heavy

Production of Portland cement in October is reported by the United States Bureau of Mines at 17,533,000 bbl., the largest figure ever reported for October. It was exceeded by the two preceding months and by August, 1927, but otherwise is the largest for any month. It compares with 17,856,000 bbl. in September and 18,730,000 bbl. in August, 1928 (the record). In October, 1927, production was 17,174,000 bbl.

Shipments in October are reported at 19,836,000 bbl. This gain is the largest for any October, and has been exceeded by only four earlier months, of which three were those immediately preceding it. There was a reduction from the 20,460,000 bbl. of September, but a heavy gain on the 18,105,000 bbl. of October, 1927.

For 10 months production made a new record, at 148,569,000 bbl.,

against the previous high of 145,460,000 bbl., made last year. Shipments in 10 months were 156,120,000 bbl., about 2 per cent above the previous record of 153,103,000 bbl., made in 1927.

Canadian Iron and Steel Production Higher

October production of pig iron in Canada is reported by the Dominion Bureau of Statistics at 93,186 gross tons, compared with 90,516 tons in September, and with only 38,097 tons a year ago. Ferroalloys to the amount of 2127 tons were produced in October, against 2008 tons in September. For the first ten months of the year pig iron production has been 838,659 tons, an increase of about 38 per cent over the 608,511 tons of last year. There has been a drop in ferroalloys within the ten months from 47,649 tons to 35,541 tons.

Steel ingot production in October was 105,437 gross tons, compared with 97,275 tons in September. Adding castings, the total was 108,987 tons, against 99,888 tons in the preceding month and only 56,371 tons a year ago.

In the ten months ingot production has reached 993,476 tons, a gain of almost 300,000 tons over last year's 695,688 tons. Castings have amounted this year to 35,221 tons, against 34,972 tons in 1927.

There were seven furnaces in blast at the end of October, representing 2725 tons daily capacity. The four furnaces not operating had a listed capacity of 1350 tons daily.

British Steel Trade Rises Sharply in October

WASHINGTON, Nov. 19.—Exports of iron and steel from the British Isles in October aggregated 377,390 gross tons, against 295,123 tons in September, while imports increased to 261,404 tons, compared with 184,464 tons, according to cablegrams received by the iron and steel division, Department of Commerce, from London. The largest export movement in October was galvanized sheets, 71,031 tons, compared with 50,116 tons in September. Tin plate ranked second, 54,210 tons against 35,270 tons. Exports of plates and black sheets totaled 45,798 tons, compared with 35,536 tons, while the outgoing movement of pig iron and ferroalloys was 43,439 tons, compared with 35,815 tons. The largest incoming products consisted of ingots and semi-finished steel, with a total of 119,914 tons, against 67,896 tons in September.

Production of pig iron increased to 543,600 tons from 503,900 tons, while the October output of steel ingots and castings aggregated 756,000 tons, compared with 718,600 tons. Active blast furnaces at the end of October totaled 136, against 131 at the end of September, while the number of open-hearth furnaces in operation decreased to 264 from 266.

Sharp Drop in Wholesale Prices

Wholesale prices of commodities in October are reported by the United States Bureau of Labor Statistics at an index of 97.8, based on 100 as the average of 1926. This shows a drop of more than 2 per cent from the September average of 100.1, and compares closely with the 97 average of a year ago. The drop has come almost entirely from sharp declines in farm products, foods and hides and leather products, all of which declined more than 3 points and some of them more than 5 points. Changes both up and down in the seven other groups were fractional only.

Metals and metal products went up to 101, compared with 100.5 in September. The change came from an increase of the iron and steel items from 94.7 to 95.1 and of non-ferrous metals from 93.8 to 95.8. No change occurred in agricultural implements, automobiles or other metal products. The metals are about 4 per cent above the 97.1 of a year ago.

October Sheet Production Gained, Orders Declined

Production of steel sheets by independent mills increased sharply during October, amounting to 369,243 net tons, compared with 318,907 tons in September, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers, Cleveland. Sales during October decreased to 344,614 tons, compared with 370,936 tons in September, and shipments also increased, resulting in some decline in unfilled orders on Nov. 1. The October report and comparisons in net tons follow:

	Oct.	Sept.	Aug.
Total number of mills.....	724	721	721
Capacity per month.....	508,000	450,500	506,000
Percentage reporting.....	70.2	70.1	70.1
Sales.....	344,614	370,936	254,397
Production...	369,243	318,907	329,396
Shipments....	354,925	322,876	324,691
Unfilled orders	525,161	539,960	498,023
Unshipped orders.....	100,800	102,313	102,825
Unsold stocks..	49,800	44,519	51,636
Percentages to Capacity			
Sales.....	96.6	117.5	71.7
Production...	103.5	101.0	92.8
Shipments....	99.5	102.2	91.5
Unfilled orders	147.3	171.0	140.4
Unshipped orders.....	28.3	32.4	29.0
Unsold stocks..	14.0	14.1	14.6

Industrial Plants Asked to Mark Roofs for Airplanes

Industrial corporations have been asked to cooperate with the Daniel Guggenheim Fund for the Promotion of Aeronautics in a nation-wide campaign for roof markings which will identify the country's towns to the aviator. Such identification is a first requisite for an air transportation system.

In a printed bulletin the Fund describes the type of roof most suitable for marking and urges the use of block letters in chrome yellow with a

black background. It is suggested that it should be from 10 to 20 ft. in height and on roofs preferably of tiled shingles, tin or other metal, or slate where the visibility is not reduced by smoke. Besides the name of the town or city, the marking should include an arrow pointing due north with the letter "N" over it and a small letter indicating the airport if there is one.

Worcester Machine Shops Unusually Busy

WORCESTER, MASS., Nov. 20.—The machine tool shops of Worcester are in a period of great activity which in the opinion of the manufacturers promises to continue for a long time. Orders have piled up in such volume that the larger establishments are not only running on a full-time daylight schedule, but are working night gangs, which are being increased as rapidly as skilled men can be found. The city is suffering from a famine of good machinists and toolmakers, and manufacturers have been compelled to seek help by advertising in the newspapers of other cities.

The Machine Division of the Norton Company, after reaching maximum daytime production, is operating some of its departments nights, with a prospect of extending this second shift. In addition to a large aggregate of business already on the books, this company has just received large orders from the Ford Motor Co., Chrysler Corporation and the General Motors Co. The Heald Machine Co. has been working night and day for some time. The Reed-Prentice Corporation has found it necessary to put on a night force, which is building up as rapidly as men can be hired. Other shops report similar conditions of active business, among them those of the Leland-Gifford Co., Stockbridge Machine Co., Arter Grinding Machine Co. and Francis Reed Co. The O. S. Walker Co. reports a heavy demand for magnetic chucks.

Philadelphia Steel Club Elects Officers

The Steel Club of Philadelphia on Nov. 13 elected the following officers for the ensuing year: Willard S. Haring, Alan Wood Iron & Steel Co., president; Paul M. King, Worth Steel Co., vice-president; Samuel H. Baker, secretary-treasurer. Thomas C. Ham, Jones & Laughlin Steel Corporation, and W. W. Deal were elected to the board of governors.

"Photomicrography and Its Application to Mechanical Engineering," by Francis F. Lucas, is the title of a pamphlet issued by the Bell Telephone Laboratories, New York. It is a reprint of a paper presented at the annual meeting of the American Society of Mechanical Engineers in joint session with the Optical Society of America in New York, December, 1927. Some very fine reproductions of photomicrographs are included.

This Issue in Brief

Profit-sharing for executives pays, especially for high men in small organizations. Payment of profits in common stock is preferable, says speaker at management meeting, because then the executive shares losses as well as profits.—Page 1291.

* * *

Cuts cost of locomotive repairing by use of "spot system" of progressive work. Stripped engines are moved progressively to various designated sections of shop, each specializing on certain work. Time for each operation is scheduled. Repair schedules are prepared five months ahead.—Page 1279.

* * *

Sounder welds are produced by coated electrodes, welding engineer declares. Chemical covering of the rod, he says, produces a gas which sheathes the arc, excluding harmful gases.—Page 1293.

* * *

Will present method of operating open-hearth furnaces be obsolete in three years? Yes, says open-hearth man. He believes that the Stevens furnace, which takes the guesswork out of combustion, will be generally adopted. Better yield and considerable savings in fuel consumption and brickwork are claimed for this furnace.—Page 1296.

* * *

Denies that anti-trust laws disregard economy and efficiency. Trade Commission may protect business by regarding as illegal any secret departure from resolutions a firm has led its competitors to believe it will observe.—Page 1282.

* * *

"Pretty miserable" is term American economist applies to French wages. Though industry in France is busy and well above pre-war level, wages are so low that buying power of wage earners is very poor. Though wages are higher in England, industry there has not reached the pre-war level, and considerable forced idleness exists.—Page 1285.

Better castings produced by pouring locomotive frame molds on edge. Pouring can be done more easily and casting is less likely to warp.—Page 1286.

* * *

Tool steel buyers' problem simplified by preparation of convenient table. Metallurgist provides a table showing chemical analyses of tool steels known to give excellent results for each kind of service.—Page 1286.

* * *

Central welding shop will enable company to get maximum savings from use of welding equipment. Many firms fail to bear in mind that welding equipment used for production can also take care of repairs, cut up scrap, install pipe lines, etc. A central welding shop cuts costs by providing a common point for handling all jobs requiring welding.—Page 1284.

* * *

Price discrimination may be regarded by Trade Commission as "unfair competition." Commissioner declares that firm price policy will be encouraged and that secret departures from prices openly established are frowned upon by the Trade Commission and may be classed as illegal.—Page 1283.

* * *

Steel can be made at lower cost in large furnaces, say open-hearth men. Slightly greater yield is obtained from large furnaces owing to deeper bath, reducing amount of oxidation, as relatively less surface is exposed for each ton of steel present.—Page 1296.

* * *

"Bootleg loans" upset forecasts by opening up new credit reservoir. Increase in credit volume is due to loans from firms and individuals, says Colonel Ayres, rather than to loans from banks. His forecaster shows business rising until the middle of 1930 and then dipping sharply, but he will not commit himself in view of the new factor — "bootleg loans." — Page 1299.

Denies allegation that sheet rolling industry is unprogressive. "Analysis of present development would give this industry a mentality of 12 years," A. S. M. E. official charges. Sheet manufacturers point to great amount of money spent on new continuous process as evidence of progressiveness. But for many years industry was in hands of mill men with little engineering knowledge.—Page 1301.

* * *

Shop superintendent keeps track of plant operations closely by means of simple visual record. Round tags, each bearing number of a locomotive, are moved forward as repair work on engines progresses. Superintendent is thus able to tell quickly when any given engine will be ready for service.—Page 1281.

* * *

Zinc can be welded with hardly any volatilization by using best brass welding rod with 0.5 per cent silicon added. And such a rod, when melted into a joint in alpha brass or admiralty brass pipe, will produce a strong, non-porous union, says metallurgist.—Page 1293.

* * *

You will lose money if you cut prices to get more business than your market affords, association head tells fabricators. Decide what kind of work you can handle profitably; find out what tonnage can reasonably be expected to come out of your territory; develop a definite selling plan, and stick to it.—Page 1289.

* * *

Bronze-welding of steel should not be done except on unimportant and non-stressed locations, says research worker. Otherwise internal stresses of at least 4000 lb. per sq. in. will occur, except in annealed metal.—Page 1293.

* * *

Makes hot strips from hot slab in one rolling, without reheating. Strips are 24-gage, long length. This is done by a process recently developed, says rolling mill builder.—Page 1302.

Managing Editor

ESTABLISHED 1855

Our Tariff and Europe

SOME familiar anti-tariff war cries were missing from the late national campaign. Never since the first comprehensive act in protection of home industry was passed at Washington have the leading national parties been so nearly at one on this question, and never has the fear of tariff unsettlement figured so little in a presidential election.

Such approach to agreement on this subject, after the hard-fought battles of other years, is not encouraging to foreign manufacturers who had hoped the election of 1928 would bring a letting down of tariff barriers. Ever since the Armistice we have heard from Europe that if the allied nations are ever to pay their debt to the United States we must arrange to let more of their goods into our ports. The one way to make this possible, we have been told, is to lower our tariff schedules. Many of our own people have held the same view. Low-tariff men naturally took to it. Many protectionists saw the force of it, but generally wanted its application limited to lines of industry other than their own. Now that the national referendum has been had, certainly there is nothing in the election returns to indicate that the people of the United States are favorable to a freer entry of foreign goods, to the displacement of the products of workers in our own industries.

European critics of our tariff, like European advocates of the cancellation of European debts to the United States, have seemed at times to believe that, if a sufficient demonstration of ill will be made, this country can be induced eventually to bargain for its abatement. No headway in better understanding will ever be made by that route. In helpfulness to Europe the United States has been generous to a degree. Yet it cannot be said that this evidence of good will has been responded to in kind. Our European allies may well take to heart some of the plain but friendly speech of the President's address at Washington on the night of Nov. 11, particularly these words:

If we could secure a more complete reciprocity in good will, the final liquidation of the balance of our foreign debts and such further limitation of armaments as would be commensurate with the treaty renouncing war, our confidence in the effectiveness of any additional efforts on our part to assist in the further progress of Europe would be greatly increased.

American tariff policy must be determined in the light of American standards of living, American industrial development, trade expansion and the many other things which accentuate the difference between American life and European life. And what holds in respect to the tariff applies also to the continued invest-

ment of American capital in Europe, in view of the great demand that will be made upon our resources by power and transportation projects in the next few years. As President Coolidge aptly said: "Europe, on the whole, has arrived at a state of financial stability and prosperity where it cannot be said we are called on to help or act much beyond a strict business basis. The needs of our own people require that any further advances by us must have most careful consideration."

These words have added significance from the knowledge that in respect to this country's attitude to Europe the President and the President-elect have long been in hearty agreement.

Less Merchant Iron, Better Prices

SINCE late in August the average market price of northern pig iron in the various districts has advanced considerably more than a dollar a ton, following a long period of declines. Reasons for such advances, depicted in our market reports, include the withdrawal of steel companies as sellers of merchant iron.

Statistics drawn from the monthly blast furnace reports of THE IRON AGE show clearly why the market should soften as it did for months and then pick up of late. There has been a remarkable divergence in the relative production of pig iron by steel companies and merchant furnaces. Of course it cannot be argued that the demand for steel and the demand for merchant iron should run precisely together, but surely they should not swing in opposite ways.

Late last year there was light demand for steel while there was heavy production of merchant iron. After January of this year merchant iron production declined, while in the last four months it has been at a steady and low rate. To bring out the divergence we compare the four months through January, with average daily rate of pig iron production by steel works of 66,407 tons, and a merchant furnace rate of 23,073 tons, with the four months through October, with a steel works' rate of 83,199 tons and a merchant furnace rate of 19,596 tons. In the first period the merchant furnaces produced 35 per cent as much as the steel works, while in the latter period they produced less than 24 per cent as much as the steel works. From the first period to the second steel works' production increased 25 per cent while merchant furnace production decreased 15 per cent.

These figures suggest strongly that pig iron must have been accumulating in the earlier period, for it is not conceivable that merchant iron demand was heavy when the steel works had such poor employment. It was well known in the trade a few months ago, as a matter of fact, that there were large stocks of merchant

iron. On the other hand it cannot be thought that the recent activity in steel has not been accompanied by a fair degree of activity on the part of consumers of merchant iron, an activity that could hardly be well taken care of by a rate of production evidently light by comparison with rates of the past.

Mere comparison of October figures is striking. In October, 1927, there was 66,991 tons of steel works iron and 22,819 tons of merchant iron daily. In October of this year there was 88,051 tons of steel works iron and 20,781 tons of merchant iron, and yet the northern steel works had largely withdrawn from the merchant pig iron market.

Length of Bull Stock Markets

SOMETIMES statistics can be boiled down to simple terms, and then they are likely to show something important. We find such condensation possible with a presentation in the Cleveland Trust Company's circular of Nov. 15; it shows twelve bull stock markets in a half century, the number of months of each being given. One bull market began with the reopening of the exchange at the beginning of 1915. One may conveniently assume the present bull market to complete the present calendar year.

In the 14 years 1915 to 1928 inclusive, the bull markets cover a total of 111 months. The preceding 14 years, 1901 to 1914, included 51 months of bull movements, and the 14-year period before that, 1887 to 1900, included 74 months. Thus the latest period has had more than twice as much bull movement, in length of time, as the intermediate period, and one and one-half times as much as the first period. Fourteen years contain 168 months. In the first period there were bull movements during 44 per cent of the time; in the second, 30 per cent, and in the present, 66 per cent.

Various references to this remarkable stock market have been made in these columns. Here is a new angle from which it may be considered. The nub of the matter lies in the question whether this country has been growing, in one way or another, at a better or more sustainable pace than in the past. Here we avoid considering the amount of the advance in share values, which contain a factor of the rise in commodity prices or the depreciation in the value of the dollar.

Instead, we have been thinking lately that the country has reached a position of maturity, and this does not seem to conform with the showing of the stock market advancing two-thirds of the time in the last 14 years, against less than one-third of the time 14 years earlier, or less than one-half the time 14 years earlier still. Such apparent inconsistencies sometimes point the way to the truth.

One must grant the maturity, at least in a relative sense. In maturity, then, one knows better what he can do, he can have more confidence in his future. There would have been more bull markets in the past if there had been assurance that the current earnings were to be continued, for there were larger yields in much of the past. In maturity there is less likelihood of sweeping changes. We do not need to fear that steel will be replaced by some other metal. If radio is to be succeeded by something better, the idea is that the radio companies themselves will be the ones to find it.

By no means, however, should anyone dismiss the idea that the present bull market may be a mistake. That term involves much latitude. Every bull market, right after its termination, has been considered a mistake, at least in part, but in the long run it proves otherwise. Here in the Cleveland Trust Company chart referred to we have share value records beginning with 1879. The bull market of 1892 failed to attain the 1882 height, while the depression of 1896 was below that of 1884, but there were falling commodity prices throughout the period and that must be allowed for. When this bull market ends it will look like a mistake but it will be only partly so unless commodity prices fall greatly, and the swing of the last few years does not appear to presage any marked change in the next few years.

Association Market Stabilizers

FALLING into line with the practice in several other basic industries, lead producers and consumers last week organized the Lead Industries Association. One of the objects is to collect and disseminate information regarding uses of lead and its products and to gather statistics on production, distribution and marketing.

About a year ago copper producers formed the Copper Institute, which supplements the valuable work of the Copper and Brass Research Association and of Copper Exporters, Inc. In recent months the American Zinc Institute started a new department, the collection of information as to the condition of forward orders on the books of producers. The net result of these activities on the copper and zinc markets has been greater stabilization, to the advantage of both producer and consumer. In lead similar results may be expected.

Workers' Share in Compensation

THE contributory principle is now generally accepted, in theory or in fact, in connection with most undertakings for the benefit of industrial employees. It is being applied rapidly to sick benefits, group life insurance, unemployment insurance and in old age pensions as distinguished from those pension plans in which workers are considered to have earned a pension by long and efficient service. The one universal exception is workmen's compensation. A movement is now under way to put this, too, on a contributory basis, compelling the employee to bear a portion of a cost now exclusively borne by the owners. To do so would be to amend the principle upon which compensation was based when it replaced employers' liability in the United States.

The proponents of the contributory plan were represented at the recent annual meeting of the National Associations of Manufacturers by Walter Linn, secretary of the Pennsylvania Self-Insurers Association, his address being entitled "The Pennsylvania Plan" because its inception was in the attempt to establish the principle by act of the Pennsylvania legislature in 1926, when the State's compensation laws were revised. In the course of his remarks Mr. Linn said:

It takes the worker out of the "gim-me" class and puts him into an insurance partnership with his employer. If he gets more, he has to pay more, and there is nothing like a personal re-

sponsibility of that sort to rationalize men's demands.

One of the attractive arguments for the plan is that it would give the employee a financial interest in reducing accidents and preventing malingering. The millions of dollars invested in safety appliances and in alterations or installation of more expensive equipment, to reduce the hazards of employment, were justified to many a corporation by the dollars and cents savings to be effected. There would appear to be grounds for the assertion that, if the workman were given the same financial interest in seeing to it that fellow workmen observed safety regulations, the psychological influence would immediately reflect itself in further and marked reductions in accident severity and frequency.

Mr. Linn's stand is not shared by most employers of labor. It does not take into account that when compensation was established to replace employer's liability it was agreed that the worker gave as his contribution a certain amount of sacrifice of benefits which were his under the old law.

Employers' liability had worked out badly. At times the employee suffered injustice, at other times the employer had to pay damages all out of proportion to the injury. The shyster doctor and lawyer were much in evidence. The fellow-servant clause rid owners of

liability where an accident to one employee was due to the negligence of another employee. One great accident might bring ruin to an owner when a group of victims received over-generous damages from a sympathetic jury. It was not good business from any point of view. An unknown quantity was always present in estimates of production costs.

Quite naturally when workmen's compensation came over from England it was quickly accepted. The gambling element of accident was eliminated. Compensation for the employee was sure for every bona fide injury. Accident expense became a fixed cost to the employer. The theory was established that the worker's share in the cost was his sacrifice of certain former advantages.

Everything in connection with the system has worked nicely. Few complaints have been heard from the employee class. Owners have found the cost a none too heavy burden. Apace with the operation of the act has proceeded a prodigious work in the reduction of accident hazard. The inevitable result has been an amazing decrease in number and seriousness of accidents. We wonder if a survey of the manufacturers of America would not find probably relatively few firms which would urge that their employees share in the cost of compensation.

Statistical Abstract of the United States

IN annual publications such as the Statistical Abstract of the United States, of which the fiftieth edition, 1928, has come to hand, each succeeding volume is nearly like those which have gone immediately before. Each new volume, however, is of increasing value, as it brings data more closely up to date, and shows us, when we study its contents, how we are progressing, both as to quantity and as to direction.

In the present edition are 842 pages consisting almost wholly of tabular matter, well indexed, and appertaining mainly to the physical characteristics of the United States and its people and their activities. Commerce, finance, agriculture, mining, forestry, fisheries, manufactures and many other topics in great profusion are treated, besides the usual figures for area, population, immigration and vital statistics.

Standards for Compressed Air and Hydraulic Work

BOTH the Hydraulic Society and the Compressed Air Society have issued books of standards covering not only the technical definitions and standard practices relating to their respective fields, but also, in each case, a set of 15 principles of business conduct approved by the two societies, and identical in form.

The Hydraulic Society is a trade association comprising the principal manufacturers of displacement and centrifugal pumps in the United States. It cooperates with the Department of Commerce, United States Chamber of Commerce, American Society of Mechanical Engineers, American Mining Congress, National Fire Prevention Association, the trade associations of other industries and other technical and commercial organizations with which the pump industry has problems in common. Its Book of Standards is of 78 pages, illustrated with both line cuts and half-tones, and carries some tabular matter and a great mass of data for the use of those interested in pump equipment.

Similar material is comprised within the 48 pages of

the Standards Book of the Compressed Air Society, this being material specific to the use of compressed air and to the equipment by which that use is carried out. The members of this society are fifteen of the leading companies making equipment for this purpose. The secretary of both societies is C. H. Rohrbach, 90 West Street, New York.

Pig Iron Output in Close Correlation with Manufacturers' Sales

CLOSE correlation between the country's monthly production of pig iron, in tons, and monthly sales, in dollars, of the Simonds Saw & Steel Co., Fitchburg, Mass., is shown in the chart, which appears in "The American Way to Prosperity," by Gifford K. Simonds, general manager, and John G. Thompson, assistant to the president of

Showing Close Parallelism Between Pig Iron Output and Simonds Sales

the Simonds company. The book, which is just off the press, is published by the A. W. Shaw Co., Chicago.

Neither of the curves shown in the graph is adjusted for long-time trend or seasonal trend.

A chapter on "Forecasting" gives many of the details of the system of forecasting used by the Simonds company.

Cast Iron Discussed by British Metallurgist

ONE of the last lectures delivered by Dr. W. H. Hatfield of Sheffield, England, on his recent tour of American metallurgical centers, was on "Cast Iron" before a joint meeting of the Boston chapter of the American Society for Steel Treating and the New England Foundrymen's Association at the Massachusetts Institute of Technology on Friday evening, Nov. 9.

The meeting was well attended, preceded by a dinner at which 75 were present. Doctor Hatfield had with him the 1928 edition of his book, "Cast Iron in the Light of Modern Research," and used this as a text for his talk which was quite informal.

First he outlined the work of the Cast Iron Research Association, which is a British institution supported by funds from the industry and from an equal contribution directly from the British Government. The affairs of the association are handled by a council made up of properly qualified men in this industry. It carries out research at Birmingham of a fundamental nature covering the metallurgy of cast iron. It also does a great deal of work in disseminating the existing knowledge regarding foundry problems and the metallurgy of cast iron. This is sent to contributing members in the form of bulletins. Also it answers any questions sent in by members and carries out at the foundries themselves research of a practical nature leading to the solving of foundry problems.

He next very briefly dealt with the addition of special alloys to cast iron and pointed out that cast iron would probably always find a large field of usefulness because of its lower melting point compared with steel. He next outlined his theory in regard to the freezing of cast iron, the separation of graphite and the final decomposition of the austenitic ground mass and pointed out briefly the influence of silicon in this mechanism of freezing. This was handled in a sensible and non-technical manner following the lines of the chapter in his book and was well received by his audience.

The lecturer next briefly referred to pearlitic cast iron, pointing out how narrowly the needed factors had to be followed and reminding us that this method was not for the jobbing foundry but might attain importance for the foundry specializing on particular work. Reference was then made to the growth of cast iron, his view of this subject being that it was intimately connected with the presence of graphite flakes in the metal, so that to prevent growth, iron should be used

which had fairly low silicon, a low total carbon, and possibly a little chromium added so as to give a suitable stable carbide. Emphasis should be laid on the complete stoppage of any graphite formation.

The lecture was followed by an animated and interesting discussion, most attention being given to semi-steel, to iron for special abrasive purposes, and to the influence of nickel on cast iron.

Princeton Engineering Building Dedicated

The new engineering building at Princeton University, Princeton, N. J., was dedicated on Nov. 15 with appropriate ceremonies, which were attended by more than 200 engineers, including representatives of 38 technical and engineering schools. The building, which cost \$500,000, will enable the university's engineering school to be greatly expanded, and new curricula will be introduced. Among the speakers at the exercises were Carleton S. Proctor, of the engineering firm of Moran, Maurice & Proctor, New York, and president of the Princeton Engineering Association; Dexter S. Kimball, dean of the school of engineering, Cornell University, and Matthew S. Sloan, president of the New York Edison Co., New York.

American Mining Congress To Meet in Washington

WASHINGTON, Nov. 16.—Rounding out nearly a third of a century of activity, the American Mining Congress will hold its thirty-first annual convention at the Mayflower Hotel in this city Dec. 5 to 8. The convention will draw to Washington the leaders in all branches of the mining industry. Governors of States having important mining interests will send official delegates, and representatives of various Government departments having contact with the industry will attend and participate in a discussion of pending mining issues.

The enlarged use of machinery in industry will occupy considerable attention by the convention. Meetings will be held of the boards of directors of the American Mining Congress, and of its Western, Southern and manufacturers' divisions. J. G. Bradley of Dundon, W. Va., president of the Elk River Coal & Lumber Co., will open the convention as president of the congress with an address on the organization as the "Clearing House for Mining." S. L. Mather of Cleveland, president of the Cleveland-Cliffs Iron

Co., will speak on the iron industry. Sidney J. Jennings of New York, president of the United States Smelting, Mining & Refining Co. and a former president of the American Mining Congress, will preside at one of the sessions and speak on the mining industry. "The Future of Copper" will be discussed by C. F. Kelley of New York, president of the Anaconda Copper Mining Co.

Canadian mining officials and operators are being extended a special invitation to attend the convention.

Lead Companies Form an Institute

Representatives of 34 companies which produce or consume lead organized the Lead Industries Institute at a meeting at the Hotel Roosevelt in New York last week. The new organization will follow closely the lines of similar associations in other industries, such as the American Iron and Steel Institute, the American Zinc Institute and the Copper Institute. Membership will comprise every large factor in the industry in the United States, Mexico, Canada and South America. Mutual protection, the dissemination of accurate information regarding the uses of lead and its products, and the collection of statistics on production, distribution and marketing are three of the main objects of the new institute.

Clinton H. Crane, president Saint Joseph Lead Co., was chosen president, with Hamilton M. Brush, general sales agent American Smelting & Refining Co., and Ralph M. Roosevelt, vice-president Eagle-Picher Lead Co., vice-presidents, and Felix E. Wormser, secretary and treasurer, all of New York. Headquarters have not yet been selected.

Consulting Chemists Form Association

The Association of Consulting Chemists and Chemical Engineers has been organized. Every member on joining "shall refrain from associating with or allowing the use of his name by any enterprise of questionable character. If in his opinion work requested of him by clients seems to present improbability of successful results, he shall so advise before undertaking the work."

The following are the officers: President, Hal T. Beans, Columbia University; vice-president, Irving Hochstadter, Hochstadter Laboratories; secretary, Clarence V. Ekroth, Ekroth Laboratories, 461 Eighth Avenue, New York; and treasurer, Jerome Alexander.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Nov. 29—Activity in Steel Consuming Industries; Dec. 20—Position of Iron and Steel Producers.

Iron and Steel Markets

Decline in Specifying Checked

Heavier Shipping Orders from Automotive Industry — First
Quarter Contracting Under Way in Sheets
and Strips—Tin Plate Advanced

STEEL output has shown a further decline, but the recession in specifications has been checked and a buying movement for the first quarter is getting under way. Finished steel prices, for the most part, remain buoyant, as evidenced by advances during the week of \$2 a ton on tin plate and tin mill black plate.

In pig iron, also, sustained market activity is indicated in most districts. In the Central West, forward contracting is extending into the second quarter of next year, and at Birmingham prices have gone up 25c. a ton.

Scrap is again notable for its contrary trend. Heavy melting scrap at Pittsburgh has declined to \$17 a ton, or \$1 below the level of four weeks ago.

Steel ingot production in the Greater Pittsburgh district now averages 80 per cent, compared with 85 per cent last week. At Chicago, output has declined to 82 per cent, largely as a result of the annual overhauling of rail mills. Similar work is being done at the Alabama rail mill, which is scheduled to resume operations Nov. 24. The rate of steel ingot output for Steel Corporation subsidiaries is 80 per cent for the second week.

Specifications for finished steel at Chicago were the largest since February, but new business is small, possibly reflecting a desire to keep stocks down preparatory to inventory taking. Cleveland, however, reports not only heavier shipping orders, but a good volume of first quarter contracting in alloy steel bars, sheets and strips.

The automotive industry, which accounted in large part for the recent decline in specifications, is conspicuous in contributing to the current recovery. It is also supplying the chief impetus to first quarter buying. In fact, parts makers that use steel bars are anxious to have prices named for next quarter for use in figuring on contracts with motor car builders.

The failure of mills to announce first quarter quotations on bars, plates and shapes is interpreted, in some quarters, as reflecting uncertainty regarding the success of an advance, in view of the seasonal decline in the demand for those commodities. On the other hand, the recent advance of \$2 a ton on sheets has been adopted by nearly all mills, and some first quarter business, notably in body sheets, has been booked at the new prices.

The rise of 10c. per base box in tin plate, to apply on contracts for the first quarter and first half of 1929, was contrary to expectations. It had been believed that the base price would be left unchanged and the cash discount reduced to 1/2 per cent. Under that plan the

mills would have netted only slightly less than with the advance and the unchanged discount.

Alloy steel bar prices now generally range from 2.65c. to 2.75c., base mill. The lower price is \$2 a ton below the last advance, which apparently failed to apply on much tonnage business.

A high rate of construction is indicated by fabricated steel awards of 47,300 tons, following a total of 55,000 tons in the previous week. The oil industry contributed one letting of 12,000 tons of storage tanks, besides miscellaneous orders (not included in the total) aggregating 10,000 tons. The gas pipe line from Tulsa, Okla., to Lockport, Ill., sponsored by the Texas Corporation and the Empire Gas & Fuel Co., will take a total of 76,528 tons, which has been divided between a Milwaukee and a Pittsburgh mill instead of being placed at Youngstown, as previously reported.

Railroad buying of the week includes the placing of 10,000 tons of rails by the Missouri-Kansas-Texas and the distribution of 800 freight cars. The Chicago & North Western is in the market for 30,000 tons of rails, and the Wabash will buy 55 locomotives.

Sales of foundry grades of pig iron by Cleveland producers, at 52,000 tons, were nearly as large as a week ago. Continued pressure for iron is evident in other districts, notably at St. Louis and Chicago. Malleable pig iron at St. Louis has been advanced 50c. a ton, and another rise of \$1 a ton in the Chicago market is regarded as an early possibility. The 25c. a ton advance at Birmingham is expected to be followed by another of 50c. In the Valleys, where the scarcity of pig iron has been relieved by the reduced needs of steel works, producers have not succeeded in raising the market to the higher quotations recently announced.

Jackson County makers of silvery pig iron and Bessemer ferrosilicon have increased prices \$2 a ton.

Structural steel lettings in October (computed) totaled 240,000 tons, compared with 319,000 tons in September.

The European steel market, especially in semi-finished and light-weight material, is moderately active because of the German lockout. Our London cable, however, reports diminishing concern over German developments, with prices easing on the Continent.

Another slight rise in THE IRON AGE composite price for pig iron, the tenth in three months, brings it to \$18.54 a gross ton, against \$18.50 last week and \$17.63 a year ago. Finished steel remains at 2.369c. a lb.

Pittsburgh

Steel Business, After Slight Lull, Shows a Gain—Tin Plate Price Raised for First Half

PITTSBURGH, Nov. 20.—Steel business in the past week has shown some gain over that of the week before. While consumers still are governed in their purchases by known requirements and are influenced to some extent by the close proximity of the inventory period, the advances announced in sheets, which have had almost full subscription to by producers, and a belief that steel makers will seek higher prices on first quarter tonnages on a number of other finished products have tended to stimulate specifications on contracts for this quarter. Sheet business is notably better, and makers of strips find this month to be running well up to October in point of tonnage releases on contracts.

There has been a further recession in plant engagement in the Youngstown district and there is evidence here and in Wheeling and Johnstown that the necessity has gone by for producing ingots to the limit of capacity. The general average of ingot production of these districts now is about 80 per cent, which compares with 90 per cent a month ago, but stands out favorably with this time last year, when ingot output was not much above 60 per cent.

Announcement of the price of tin plate for the first half of next year has been followed by an expansion in orders and in mill operations, which had been somewhat checked by the lack of information respecting prices. The price was a surprise in view of the common expectation that any change would be in the discount for cash rather than in the base price.

In leaving the cash discount at 2 per cent and raising the base price to produce as much of a return as would have resulted from a lower discount, the mills have partly opened the question of the discount on sheets, as sheet jobbers, in protesting the reduction in the discount on sheets, advanced the suggestion that the price be raised and the discount be allowed

to remain at 2 per cent. The dominating consideration probably is found in the fact that advances have been better held in tin plate than in sheets.

A local maker of seamless pipe shares in a line pipe order recently closed requiring in all nearly 78,000 tons. Pipe makers feel pretty cheerful about the oil country pipe requirements for next year.

Dealings in pig iron confirm the impression held by buyers that producers had higher price ideas than they could realize. Basic iron again has been sold at \$17.50, Valley furnace, in the face of \$18 asked. Another drop of 25c. a ton on heavy melting scrap means that this material has gone down \$1 a ton in four weeks.

Pig Iron.—An Alliance, Ohio, melter has closed for 5000 tons of basic iron for first quarter delivery at \$17.50, Valley furnace, the business being divided among three producers. This transaction clarifies the price of that grade, on which the common quotation recently was \$18, Valley furnace. No important sale of this grade has been made at more than \$17.50, Valley furnaces, and that price now appears to be as high as can be done in view of the fact that steel companies, which recently had none for sale, now

appear to have some available for the market. A merchant furnace, which will start up about the middle of next month, will make basic in addition to foundry and malleable iron. Fair-sized tonnages of foundry iron, including some of 1000 tons or more, have been sold for first quarter shipment at \$18, Valley furnace, for No. 2 grade, but the purchases were entirely by melters west of the Valleys and the freight rates to their plants are well under those to the Pittsburgh district. Delivered prices in most cases would work back to approximately \$17.50, Valley furnace, if the delivery were to this district, and, indeed, that price actually continues to be made on business in this district. Bessemer and malleable iron hold at the prices of a week ago, but with sales mostly in small lots. Some large users of foundry iron in this area are melting rather moderately, and one very large consumer reports that present supplies will last well through January. Asking prices on iron generally have been a little higher than consumers have been willing to pay or have been obliged to pay when they were able to offer attractive tonnages.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50 to \$18.00
Bessemer	18.25 to 18.50
Gray forge	17.00 to 17.50
No. 2 foundry	17.50 to 18.00
No. 3 foundry	17.00 to 17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Specifications for billets, slabs and sheet bars on fourth quarter contracts continue heavy, but new business does not amount to much, as non-integrated manufacturers do not find it necessary to supplement contract deliveries and it is a little early for them to be interested in first quarter requirements. For the latter delivery the mills are asking \$34, Pittsburgh or Youngstown, for sheet bars, an advance of \$1 a ton, but are holding to the present price of \$33 for large billets and slabs. Wire rods are firm at \$42, base Pittsburgh or Cleveland. There is talk of higher prices for nails

and wire and, if they come, an advance on rods is a likelihood.

Bars, Plates and Shapes.—Business is rather slow, particularly in comparison with the record for October. Those who buy bars for further manufacture are not doing as well as they did a few weeks ago and consequently are sparing in ordering shipments on contracts. Demand for merchant bars is steady and reinforcing bars are moving well, although individual sales and specifications are small. While the inquiry for fabricated steel is brisk, actual awards of size are few. Plate fabricating shops are not especially busy. Views as to first quarter bar, plate and shape prices are mixed. There is a belief in some quarters that an advance might encounter some difficulty in face of the seasonal decline in demand and the fact that considerable fourth quarter contract tonnage written mostly at 1.90c., base, remains to be specified. On the other hand, a single price basis is getting serious consideration and that would mean higher prices on much tonnage through a reduction or an elimination of the preferred buyers. The essential change in the market as compared with October is that fairly prompt deliveries are promised on all three products.

Rails and Track Supplies.—The New York Central Lines will open bids Nov. 27 on the tie plates and spikes to go along with its recent standard-section rail orders. This is a Clayton Law inquiry. Railroads supplied with rails from Pittsburgh have placed their 1929 requirements, and the local rail mill is now understood to be sold up for a run of four months. Light-section rails are dull in keeping with the fact that the coal market is neither active nor profitable enough to sustain a very full operation of the mines. Spike prices show some irregularity, but those for rails and tie plates are steady.

Wire Products.—Business is as much as one-third below that of October, but is as good as usual at this time of the year, when inventory considerations influence purchases. Prices

are very steady. Manufacturers have not yet taken action on first quarter prices. A new sales method for woven wire fence, providing zone prices, is an early possibility.

Tubular Goods.—The pipe for a gas line to run from Tulsa, Okla., to Lockport, Ill., it develops, will be furnished by a Milwaukee and a local mill and not by Youngstown mills, as was at first reported. For this line, sponsored by the Texas Company and the Empire Gas & Fuel Co., the A. O. Smith Corporation, Milwaukee, will furnish 630 miles of 12¾-in. pipe, or 71,528 net tons, while 100 miles of 6½-in., or 5000 tons, seamless pipe will be produced by Spang, Chalfant & Co. Pipe business generally is making a fairly good showing. While oil country requirements are no tax upon productive capacity, the demand for them is constant and standard-weight pipe is doing as well as it ever does at this time of year.

Sheets.—With the announcement late last week by the American Sheet & Tin Plate Co. of an advance of \$2 a ton in prices, to 2.85c., base Pittsburgh, for black; 3.60c., base, for galvanized; 2.10c., base, for blue annealed; 4.10c., base, for automobile body sheets, and 3c., base, for tin mill black plate, mills representing most of the productive capacity of the country now are quoting these prices. Some business for January and February shipments has been booked at the new levels, but dependence for mill schedules still is upon specifications on fourth quarter contracts and these are reported to be coming along in good volume, considering the lighter requirements of the motor car builders and the close proximity of the end of the year, which usually means some contraction in tonnage releases.

Tin Plate.—There has been a substantial quickening in demand and mill operations since the announcement of the American Sheet & Tin Plate Co. on Nov. 15 of the new prices to rule on contracts for the first quarter and half of next year. The announcement was quite contrary to expectations in that the base price was

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

advanced 10c. per box and the discount for cash in 10 days allowed to remain at 2 per cent; it was commonly believed that the discount would be reduced to one-half of 1 per cent and that the base prices would remain at \$5.25, Pittsburgh, and \$5.35, Gary. The advance in the base prices to \$5.35, Pittsburgh, and \$5.45, Gary, gives the mills slightly more than they would have obtained by allowing the former prices to stand and to cut the discount.

Cold-Finished Steel Bars and Shafting.—Shipments on old orders or contracts are good, but new business is light and order books are dwindling. Sentiment still is divided as to first quarter prices. On account of the narrow spread between hot-rolled and cold-finished steel bar prices, many believe that the price should be advanced regardless of the first quarter hot-rolled bar prices, but others wait on the announcement of the first quarter hot-rolled bar price.

Hot-Rolled Flats.—Some strip makers find business somewhat under the October record, but others report orders and specifications to be running this month at substantially the same rate as last month. The need of orders is not urgent enough to cause the mills to take them except at full prices. The real test of the new prices and the card of extras is ahead, as large consumers have not yet started negotiations for first quarter tonnages.

Cold-Rolled Strips.—Business is holding up better than most makers expected it would. On new orders, 2.85c., base Pittsburgh, is well maintained, and small tonnages are being sold at as high as 2.95c., base. The bulk of the tonnage, however, is being shipped at this quarter's contract price of 2.75c., base.

Coke and Coal.—Offerings of spot coke, both furnace and foundry, still are ample for wants. Prices are no more than steady at last week's levels.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes...	2.90c.
Reinforcing steel bars.....	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons.....	3.60c.
Squares and flats.....	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24), 25 or more bundles	3.70c.
Galv. sheets (No. 24), 25 or more bundles	4.55c.
Blue ann'l'd sheets (No. 10), 1 to 10 sheets.....	3.35c.
Galv. corrug. sheets (No. 28), per square	\$4.43
Spikes, large.....	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.

Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

The coal market is dull and very weak. With the Lake shipping season almost over, an outlet of size has been closed and there has not been a corresponding curtailment of production. The result is that buyers have much more to say as to prices than producers.

Old Material.—Heavy melting steel has been sold within the past week at \$17 for delivery to three points in the district. More seems impossible to obtain; dealers with short orders to cover report considerable difficulty in purchasing for less. Scrap rails and compressed sheets also command \$17 on sales into consumption. The market, as typified by heavy melting steel, has dropped an even dollar per ton from its peak of a month ago, but this decline seems to be more a case of deflation than of outright weakness, as supplies still are scant. Lower prices are noted on most grades in sympathy with heavy melting steel.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....		\$17.00
Scrap rails		17.00
Compressed sheet steel....		17.00
Bundled sheets, sides and ends	\$15.50 to	16.00
Cast iron carwheels.....	15.00 to	15.50
Sheet bar crops, ordinary..	17.00 to	17.50
Heavy breakable cast....	13.50 to	14.00
No. 2 railroad wrought...		17.00
Heavy steel axle turnings..		15.00
Machine shop turnings....	10.50 to	11.00
Acid Open-Hearth Grades:		
Railr. knuckles and couplers	18.50 to	19.00
Railr. coil and leaf springs	18.50 to	19.00
Rolled steel wheels.....	18.50 to	19.00
Low phos. billet and bloom ends	20.50 to	21.00
Low phos., mill plates....	19.00 to	19.50
Low phos., light grade....	18.00 to	18.50
Low phos., sheet bar crops	19.00 to	19.50
Hvy. steel axle turnings..		15.00
Electric Furnace Grades:		
Low phos. punchings.....	18.50 to	19.00
Hvy. steel axle turnings..		15.00
Blast Furnace Grades:		
Short shoveling steel turnings	12.00 to	12.50
Short mixed borings and turnings	12.00 to	12.50
Cast iron borings.....	12.00 to	12.50
No. 2 busheling.....	9.50 to	10.00
Rolling Mill Grades:		
Steel car axles.....	20.00 to	21.00
No. 1 railroad wrought...	13.00 to	13.50
Sheet bar crops.....	18.00 to	18.50
Cupola Grades:		
No. 1 cast.....	14.50 to	15.00
Rails 3 ft. and under.....	17.50 to	18.00

Edgar E. Brosius, Inc., engaged in designing and marketing steel plant and blast furnace equipment, no longer "farms" the manufacture of the various machines and equipment bearing the Brosius trademark to outside shops, but does this work in a plant of its own located in Sharpsburg, just outside the corporate limits of Pittsburgh. Among the Brosius products are a double barrel automatic clay gun for blast furnace plants, an automatic single hoist grab bucket for handling loose materials, such as cinder, coal and ashes, a single hook grab bucket, cinder notch stoppers, coke testing tumbling barrels, various types of charging machines, ash pit buckets, monorail bucket hoists, dump buckets, the wide opening scraper type grab buckets and crucible drawing and charging machines.

First Boat Load of Steel Reaches Moline, Ill.

The first shipment of steel to pass through Moline, Ill., by boat since the Inland Waterway Corporation started operating, went through the Moline locks Nov. 8. The barge, containing 385 tons of steel wire products, was forwarded by a Pittsburgh producer.

Continuous Furnaces Have Soaking Chambers

Two triple fired continuous furnaces, built by the Rust Engineering Co., Pittsburgh, for the Timken Roller Bearing Co., at Canton, Ohio, have been put into operation. Each is designed to heat 40 tons of 18 ft. x 10 in. x 10-in. blooms per hour.

One of the features of these furnaces is an independently fired soaking chamber, through which the blooms pass just before being discharged. This soaking chamber is separately controlled from the rest of the furnace although built as part of it. Two sets of burners immediately behind the soaking chamber, fire above and beneath the blooms, and it is these burners which determine the tonnage output of the furnace, the soaking chamber being used as the name implies, to soak the blooms and equalize their temperature throughout.

Wood Refuse as Fuel

Many plants which have a large amount of wood refuse from operations are utilizing this as a part of the fuel burned under boilers for producing steam. In some cases this is comminuted and then sent through suction pipes to hoppers over the boilers, which may be at a distant point. Other methods of handling are more or less widely used. In any case, however, the material usually is thrown into the furnace by means of pressure from behind or suction from the stack.

Considerable quantities of moisture usually are present in waste wood. Experiments have determined the remaining available heat in this material with varying contents of moisture. Based on 8700 B.t.u. for each pound of dry wood, with an assumed stack temperature of 560 deg., the heat available with wood containing 10 per cent moisture is about 7700 B.t.u. This quantity reduces by about 1000 B.t.u. for each addition of 10 per cent in the moisture.

Woods of various kinds have varying heating values when dry. Oak is given as 8316 B.t.u., while pine is listed as 9753 B.t.u. Ash, elm, beech, birch and fir are given intermediate grades, the ash being nearest to the oak. These thermal figures are taken from a pamphlet, "Burning Wood Refuse for Fuel," issued by the International Combustion Engineering Corporation, 201 Madison Avenue, New York.

Chicago

Heavy Specifications for Steel But New Buying is Light— Ingot Output Now at 82 Per Cent

CHICAGO, Nov. 20.—Large buyers in the Western steel market are inactive from the viewpoint of new purchases, but their shipping orders to cover nearby requirements have swelled total specifications for finished steel products to the largest volume since the third week in February. New orders are small, indicating the intention of users to take care of immediate needs only and to cut stocks to the minimum in anticipation of the year-end inventory period. A few buyers have stated their expected requirements for the first quarter in the new year.

Prices of plates, shapes and bars are firm at 2c. to 2.10c. per lb., and, as the circle of buyers at 2.10c. expands, producers to the east of Chicago find this territory a more fertile field for the sale of their products.

The number of furnaces in blast remains unchanged, but it is probable that an Inland stack, which is now being relined, will be blown in soon after Dec. 1. Steel mill pig iron production is a trifle in excess of finishing departments' demands, affording producers an opportunity to offer small lots to the merchant pig iron trade.

Rail mills, having completed the most urgent requests for immediate delivery, are operating at greatly reduced output while the mechanical equipment is being put in shape for the heavy winter and spring rolling schedules. Curtailment in rail production has brought down the rate of ingot output, the average now being about 82 per cent of capacity. Building operations in Illinois in October swung upward in contrast with the downward movement a year ago.

Pig Iron.—This market remains strong. Shipments of Northern iron are going forward in heavy total tonnage. Quotations for large tonnages are at \$20 a ton and scattered lots bring \$20.50. It is believed in some quarters that an advance to \$21 is an early possibility. A Chicago buyer is in the market for 5000 tons of basic iron for delivery east of here. A Wisconsin user has placed a round tonnage of malleable iron and another order is for 2000 tons. Several Northern iron purchases aggregate 4000 tons. Southern iron has been advanced 25c. to \$16.50 a ton, Birmingham. The charcoal iron market remains active, and prices are strong at \$24 a ton, furnace. The three producers have their four furnaces in blast and a shortage exists in several grades. Several brokers in Chicago have received notice that silvery iron is advanced \$2 a ton, bringing the 10 per cent grade to \$30 a ton, f.o.b. Jackson County, Ohio, furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.51
Low phos., sil. 1 to 2, copper free	\$29.00 to 29.50
Silvery, sil. 8 per cent.....	31.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Spiegeleisen is being

offered to local users in tonnage lots at \$31 a ton, Hazard, Pa., in the 19 to 21 per cent grade. The delivered price of \$83.50 a ton for ferrosilicon has not held on all 1929 contracts, cuts of \$2 to \$3 a ton having been made.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—A Chicago fabricator has taken 12,000 tons of oil storage tank work for the Roxana Petroleum Corporation. The tanks are a part of a program of 130 to be erected by this oil company at Houston, Tex. In addition to the above tonnage, about 10,000 tons of tank plates has been ordered by miscellaneous users in the Southwest and on the Pacific Coast. Among fresh inquiries for railroad equipment are 500 underframes, 200 tank cars and 50 steel caboose cars. Greater activity in car shops is indicated by larger specifications for steel from that source. Average deliveries on plate mill products are about two weeks.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago

Cast Iron Pipe.—Marked improvement is noted in this market. Actual orders have not mounted to any extent, but definite and large-sized inquiry is in the making. Contractors have placed orders for a total of 5000 tons; railroads, gas companies and other miscellaneous users are ordering more liberal quantities. Many municipalities are taking prompt action on pipe covered by recent bond issues, and sellers expect that a number of actual inquiries will be before the trade by the turn of the year. Deliveries are prompt. Prices are steady at \$37 to \$38 a ton, Birmingham, for 6 in. and larger diameter pipe.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$45.20 to \$46.20; 4-in., \$49.20 to \$50.20; Class A and gas pipe, \$4 extra.

Bars.—Demand for bar mill products is well sustained. Shipments of mild steel bars represent about 87 per cent of mill capacity. Both automobile and parts makers' needs are lower, but schedules that are now being arranged for deliveries in December give promise of heavier shipments to those users. The new six-cylinder Chevrolet car is in production and shipments of steel to that manufacturer are heavier. Needs of agricul-

tural machinery plants are larger than had been anticipated at the turn of the quarter and orders for fill-in tonnages are being placed with mills. Chicago prices for mild steel bars are stronger at 2c. to 2.10c. per lb. The iron bar market is quiet except for scattered orders from the railroads for immediate shipment. Shipments of alloy steel bars to automobile manufacturers are fully 30 per cent lower than at the turn of the month. Producers here have met this situation with a cut in operations to 75 per cent of capacity. Alloy quality bar base prices, f.o.b. makers' mills, are 2.65c. to 2.75c. per lb., depending on the character of orders. Prices for rail steel bars are strong; scattered sales have been made at 2.05c. per lb., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Structural Material.—In the absence of large tonnage awards, this market is being supported by fabricators' needs for old orders. Specifications are heavy, considering the time of the year, and, for the most part, shops are well engaged and have sizable backlogs. It is reported that the Fine Arts Building, Chicago, requiring 5000 tons, will again be brought out for bids, and Dec. 1 is the date now set for opening bids on the 15,000 tons needed for the Chicago Board of Trade Building. Fresh inquiry is light, and bidding is keen, with resultant low prices. It is reported that an order will soon be placed for the 4000 tons required for the Northwestern National Bank Building at Minneapolis.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Rails and Track Supplies.—Rail purchases in the week have come from miscellaneous sources and aggregate a few thousand tons. Fresh inquiry for 40,000 tons includes 30,000 tons for the Chicago & North Western. The track accessory market is active, with sales of 15,000 tons and inquiries for 30,000 tons. The Missouri Pacific is in the market for 4,000,000 tie plates, of which 2,000,000 are to be of copper-bearing steel. Several round tonnages of iron tie plates are also being sought. Prices for tie plates are steady at Chicago at \$43 a ton, but to the south quotations are said to be lower than this figure. The light rail market is dull. Output of standard-section rails is sharply curtailed this week while producers attempt to put mills in condition for the winter and spring rolling schedules.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Sheets.—Demand from most users has lessened. Based on present indications, hot mill output will drop below the current rate of 85 per cent of capacity by the end of this week. Barrel and light tank makers have entered their dull season and the roof-

ing trade has not come out of the slump experienced several weeks ago. Sellers report a favorable outlook for railroad car roof sheets, but this business is not expected to develop in volume before late winter or early spring. With the approach of the inventory season, there is the urge among consumers to hold stocks to a minimum; accordingly, current sales are light. First quarter business is developing slowly, with no sales reported, but inquiry is moderately active. Deliveries are somewhat improved, especially in the blue annealed product, which can be had in two weeks.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c. to 3.00c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Coke.—Buyers of by-product foundry coke are actively seeking contracts for first half, but sellers have not opened their books for the new year. Prices are strong at \$8, local ovens, and \$8.75, delivered in the Chicago switching district.

Bolts, Nuts and Rivets.—Specifications from agricultural machinery manufacturers are unusually heavy and some improvement is seen in demands from the railroads. Several large users are taking smaller quantities, with the net result that output remains at 65 per cent of capacity.

Reinforcing Bars.—Although prices remain at the low levels of recent weeks, sellers are now disposed to quote higher. Local producers contemplate making a \$5 a ton extra charge on cut to length orders. This would bring the mill cut to length quotation to 2.35c. per lb. Mild steel bars out of Chicago warehouses are quoted 2.10c. per lb. Business during the week has been light.

Cold-Rolled Strip.—Books have been opened for first quarter at 2.85c. to 2.95c. per lb., Cleveland. The freight rate to Chicago is 30c. per 100 lb. New buying is light, but improvement is noted in specifications. Inquiry for future needs, especially by automobile manufacturers, is active.

Cold-Finished Bars.—Prices are firm at 2.20c. per lb., Chicago, for de-

livery during the remainder of this year. Sales are in fair volume and specifications are sustaining output at nearly local plant capacity.

Wire Products.—Purchases average well up to those of recent weeks and mill output is supported at 65 per cent of capacity. November shipments are running a trifle above the rate in October and decidedly better than in November, 1927. Demand for woven wire fencing continues dull and below seasonal expectations. Prices for nails are steady. The tonnage shipped in the first 10 months of this year was smaller than that shipped in the corresponding period of 1927. Current orders, although still small, show some improvement over the total for last week. Jobbers in the Northwest are rounding out stocks and are ordering more freely. The jobbing trade in the South is quiet, but it is more active in the Central West and in the East.

Wire Rods.—Specifications are for liberal quantities and current purchases for immediate delivery are in fair volume. Prices are firm at \$43 a gross ton, Chicago.

Old Material.—The Chicago scrap market is marking time, in the absence of movement of heavy tonnage grades, except as dealers trade against old orders. Brokers are paying \$14 to \$14.85 a gross ton, delivered, for heavy melting steel, in which grade orders were taken at \$14.50 to \$15. The supply is more than adequate to meet current requirements of buyers, and inspections are tightening, with the result that rejected scrap is quite troublesome. At a recent sale by the Chicago & Alton Railroad, heavy melting steel was bid in at \$15.10 a gross ton, delivered, indicating the lower range of prices that brokers are willing to pay at sources of supply. On the whole, consumption remains large and many dealers take this condition as an indication that prices in the next few weeks will not fluctuate over a wide range. Railroad shipments are coming out more slowly, deliveries now being 30 to 40 days, while at the turn of the month scrap appeared on track within a few days after it was sold. Cast iron borings are quiet except in dealer activity in covering old contracts. One

user has requested sellers to hold back shipments. Bad weather is hindering the preparation and loading of scrap in local yards. Electric furnace grades are moving in good volume and sales are active. Miscellaneous foundry grades are being taken in small lots for immediate consumption. Dealers no longer are having trouble in obtaining cars for scrap.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraulic compressed sheets	12.50 to 13.00
Drop forge flashings.....	10.50 to 11.00
Forg'd, cast and r'l'd steel carwheels	17.75 to 18.25
Railr'd tires, charg. box size	17.50 to 18.00
Railr'd leaf spring cut apart	17.25 to 17.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings.....	14.00 to 14.50
Low phos. punchings.....	16.25 to 16.75
Low phos. plate, 12 in. and under	16.00 to 16.50
Blast Furnace Grades:	
Axle turnings.....	12.00 to 12.50
Cast iron borings.....	11.50 to 12.00
Short shoveling turnings..	11.50 to 12.00
Machine shop turnings....	7.50 to 8.00
Rolling Mill Grades:	
Iron rails.....	15.00 to 15.50
Rerolling rails	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.50 to 18.00
Angle bars, steel.....	16.50 to 17.00

Steel Castings Orders Decline in October

WASHINGTON, Nov. 20.—Orders for commercial steel castings in October totaled 77,783 tons, or 54 per cent of the monthly capacity of the 129 manufacturers reporting to the Department of Commerce. Orders in September amounted to 82,329 tons, or 57 per cent of capacity. Production in October was 86,669 tons, or 60 per cent of capacity, against 75,356 tons, or 52 per cent of capacity, in September.

Of the October orders, 26,529 tons was for railroad specialties, being 39 per cent of that class of capacity;

while 51,254 tons was for miscellaneous castings, representing 67 per cent of that class of capacity. Of the October production, 29,113 tons was for railroad specialties, or 33 per cent of that class of capacity, and 57,556 tons was for miscellaneous castings, being 75 per cent of that class of capacity.

Orders for commercial castings for the 10 months ended with October totaled 814,571 tons, against 779,062 tons for the corresponding period of last year. Production during the 10 months of the current year aggregated 852,609 tons, compared with 847,386 tons for the corresponding period of last year.

Philadelphia

Steel Consumers Well Engaged and Specifying Freely —Jobbers Advance Sheets \$3 a Ton

PHILADELPHIA, Nov. 20.—First quarter buying of pig iron and steel is expected by most sellers to develop early next month, by which time it is believed that most consumers will be in a position to estimate their requirements for the period. Deliveries of steel on contracts are in good volume. Shipyards are quoting on more tonnage than for a number of years, local radio manufacturers are operating at a high rate and fabricating shops are expecting some substantial business for next year from the Reading Railroad electrification to be begun in the spring. Warehouses have advanced blue annealed, black and galvanized sheet prices \$3 a ton.

Pig Iron.—Only 20 to 25 per cent of the total tonnage of foundry iron required by consumers in this district for the next quarter is estimated to be under contract. Furnaces have backlogs sufficient to carry them into January. For delivery this year the market is firm at \$20.50 per ton, but the quotation of \$21 per ton for first quarter contracts has not yet been tested by the purchase of a substantial tonnage. Low phosphorus iron continues inactive in this district, but the price is firm. A large user of basic iron, which has been in the market for about 20,000 tons, is expected to buy this week.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$21.26 to \$21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.00
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Practically all the important consumers have contracted for next year with domestic producers at \$105 per ton, seaboard. British sellers report a few contracts for small tonnages.

Bars.—Mills have sufficient tonnage in sight or on order to carry them to the end of the year. Current contracts are at 1.90c. and 1.95c., Pittsburgh, but 2c., Pittsburgh, or 2.32c., Philadelphia, is being maintained on new business. Contracting for the next quarter has not yet begun.

Shapes.—Fabricating shops are busy and have some desirable business in prospect for next year. Shipbuilders are more active in bidding for contracts than for some time and are expected to provide a substantial tonnage of shape business next year. Prices are unchanged at 2.05c. per lb., f.o.b. nearest mill to consumer, or 2.11c., Philadelphia, based on Pen-coyd, Pa.

Plates.—Bids on four ships requiring 13,500 tons of plates to be built for the Export Steamship Corporation, New York, have been rejected, and it is understood that a new and slightly less elaborate specification is

to be prepared. The Pusey & Jones Corporation at Wilmington, Del., has contracts for three private yachts, about 236 ft. over all and a \$750,000 oil tanker for the Tidewater Oil Co. Plate prices continue at 2.05c. to 2.15c., Coatesville, or 2.15c. to 2.25c., Philadelphia, with most of the current buying of small lots at 2.10c., Coatesville.

Sheets.—Eastern Pennsylvania mills have advanced sheet prices \$2 a ton for delivery over the rest of this year and for first quarter. Prior to the increase, consumers were given an opportunity to place any additional requirements for the present quarter at the former prices, so no test of the new level is in prospect until first quarter contracting develops. The extra charge of 10c. per 100 lb. on blue annealed sheets 45 in. and wider has been eliminated with the advance to 2.10c., base Pittsburgh. Black sheets are quoted at 2.85c., Pittsburgh, or 3.17c., Philadelphia, and galvanized at 3.60c., Pittsburgh, or 3.92c., Philadelphia.

Warehouse Business.—To adjust their sheet prices to the new mill situation, jobbers have advanced black and galvanized sheets \$3 a ton to 4c. per lb. for black and 4.75c. per lb. for galvanized, effective Nov. 19, and have increased blue annealed to 3.15c. per lb., effective Nov. 20. Announcement is also made that freight will be allowed on shipments to consumers in

Philadelphia, Berks, Northampton, Lehigh Counties, Pa., Warren County, N. J., and the State of Delaware, on steel bars, shapes, hoops, bands and cold-finished bars.

Imports.—Arrivals of pig iron at this port in the week ended Nov. 17 totaled 855 tons, of which 706 tons came from British India and 149 tons from the Netherlands. A total of 335 tons of spiegeleisen and 31 tons of ferromanganese was received from the United Kingdom and 900 tons of chrome ore from Portuguese Africa. Steel imports consisted of 43 tons of structural shapes from Germany and 35 tons from France, seven tons of strip steel from the United Kingdom, eight tons of iron bars from Sweden and 1002 tons of skelp from France.

Old Material.—All grades of iron and steel scrap are inactive. Although prices are substantially unchanged, there is an undertone of weakness. Heavy breakable cast is not quotable at more than \$16, based on offers made by dealers. A small tonnage of No. 1 cast has been sold by a broker at \$17 per ton, delivered, but the maximum price today is said by sellers to be \$16.75 per ton, delivered. No. 1 heavy melting steel is quiet; on a moderate sized tonnage, dealers believe \$15.50 per ton is the market.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.50 to \$16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.00 to 11.25
Heavy axle turnings (or equiv.)	12.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	16.00
Railroad grate bars	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	21.50 to 22.00
No. 1 forge fire	12.50 to 13.00
Cast iron carwheels	16.50
No. 1 cast	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling	16.50 to 17.00

Reduction in Building

Building construction in the United States in October is placed at an index of 243 by the Associated General Contractors of America. This is on the base of 100 for the average of 1913. It shows a sharp reduction from the 266 in September, but otherwise, except for the 244 in June, was the highest figure yet reached.

The first unit of the new by-product coke plant of the Davison Coke & Iron Co., Neville Island, Pittsburgh, will be one of 35 Koppers-Becker ovens and will be built by the Koppers Construction Co., which also will build and instal the coal and coke handling equipment, the by-product, benzol and gas purification units.

Cleveland

Releases by Automobile Companies Increase Steel Bookings —Pig Iron Sales Heavy, Some for All of First Half

CLEVELAND, Nov. 20.—The demand for finished steel increased the past week following the lull during the earlier part of the month. The increase is due to a large extent to the releasing of larger specifications by the automotive industry, which evidently is planning heavier production schedules during the latter part of December. Better specifications have come from this source for sheets and hot-rolled strip. Most buyers in other fields are taking out about all the steel covered by their contracts. Mills are getting a fair amount of business in current orders for steel bars, plates and structural material. Quite a little inquiry has come out for first quarter contracts. Many of the larger consumers of alloy steel bars have covered for the quarter and some contracts for that delivery have been placed by the automotive industry for sheets and hot and cold-rolled strip steel. Some of the steel bar users in that field are anxious to have prices named for the first quarter to be used as a basis for figuring contracts with automobile manufacturers, but none of the mills has as yet named first quarter prices on steel bars, plates and shapes.

Local structural awards during the week included two 3000-ton lots. There is not much new inquiry.

Local mills continue to quote steel bars at 1.90c., Cleveland, and while 1.95c., Pittsburgh, is the usual quotation by outside mills, they find it necessary to go to 1.90c. for shipment to some points because of the Cleveland mill competition. In using a Cleveland base, outside makers quote 1.95c. to 2.05c. Plates and structural shapes are commonly quoted at 1.95c. to 2c., Pittsburgh.

Iron Ore.—The consumption of Lake Superior ore during October was 5,024,642 tons, a gain of 416,679 tons for the month. This compares with 4,023,985 tons consumed in October last year. Furnace stocks Nov. 1 amounted to 33,081,717 tons and stocks on furnace yards and Lake Erie docks on that date amounted to 39,554,612 tons, compared with 42,163,529 tons on the same date a year ago. There were 169 furnaces in blast Oct. 31, an increase of eight for the month. Ore shipments this month up to Nov. 16, inclusive, amounted to approximately 3,500,000 tons. As several of the ore firms shipped their last cargoes Monday, shipments will be rather light during the remainder of the month.

Pig Iron.—The market continues very active in foundry and malleable grades. Sales by Cleveland interests during the week were 52,000 tons, only slightly less than those of the week before. Prices are firm at the recent advance. Buying is now extending into second quarter. A Cleveland producer, after having sold considerable iron for the first quarter, announced last week that it would hereafter limit its sales to contracts for the entire first half and has made several sales for the most extended deliveries at \$18.50, furnace, for out-of-town shipment. Other producers have not yet opened their books for delivery beyond the first quarter. One Lake furnace is holding to \$19 for foundry and malleable iron and is making sales at that price in Indiana, but this price virtually shuts this producer out of the Ohio market. The

Cleveland furnace price for local delivery is \$19, furnace, and \$20 is the ruling price in Michigan. Several large consumers in the automotive field have contracted for the first quarter, but some of the larger consumers in other fields have not yet bought for that delivery. Among current inquiries is one from the Link-Belt Co., Indianapolis, for 5000 tons of malleable iron. Southern foundry iron has been advanced 25c. a ton to \$16.50, Birmingham. A \$2 a ton advance on Ohio silvery iron has been announced.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	22.50
Malleable	19.50
Ohio silvery, 8 per cent....	30.00
Basic Valley furnace.....	\$17.50 to 18.00
Stand. low phos., V'ley fur. 26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Alloy Steel Bars.—Manufacturers have opened their books for the first quarter at 2.65c., base, for large buyers and at 2.75c. for smaller consumers. A number of the larger consumers in the automotive industry have already placed contracts for the quarter. The 2.65c. base is a \$2 a ton concession from the regular quotation, but there have been recent reports of price shading. Previous to the adoption of the present method of quoting, with one base and added alloy differentials, there was a spread in prices and the attempt to maintain one price for both large and small buyers is said to have not worked out satisfactorily.

Sheets.—Nearly all the mills have

Warehouse Prices, f.o.b. Cleveland

No. 9 gal. wire, per 100 lb.....	3.30
Com. wire nails, base per keg.....	2.85

*Net base, including boxing and cutting to length.

adopted the \$2 a ton price advance on all grades for current orders and the first quarter. However, some have not yet closed the door on regular customers who wish to place tonnage at the old prices that can be delivered in December. The market has a firm tone and some first quarter business, particularly in auto body sheets, has been taken at the new prices. Advances of \$2 a ton are announced on tin mill black plate to 3c., Pittsburgh, and on tin plate to \$5.35. Mill operations show a slight decrease.

Coke.—The current price of \$7.75, Painesville, for by-product foundry coke has been reestablished for December shipment. Specifications are good, but new demand is light.

Reinforcing Bars.—The seasonal falling off in the demand is in evidence. On billet steel bars, 1.85c., Cleveland, apparently has not disappeared. Rail steel bars are quoted at 1.95c., mill.

Wire Products.—Nails are moving slowly. Jobbers have good stocks, some evidently having taken advantage of concessions that some mills have allowed recently from the \$2.55 price. Wire is firm. It is still uncertain whether prices will be advanced for the first quarter.

Warehouse Business.—Sheets are moving well, but the demand for other products is somewhat lighter than during October. This is regarded as a seasonal falling off due in part to a lessened demand from the building field.

Strip Steel.—Several consumers in the automotive field have placed first quarter contracts at the prices announced a week ago by some of the mills, or at the same prices that have been prevailing recently. These are 1.90c., Pittsburgh, for hot-rolled strip up to 6 in. wide and 2c. for 6 in. and wider and 2.85c., Cleveland and Pittsburgh, for cold-rolled strip. Some of the mills are holding to 2.95c. on the latter for small lots. Fender stock has been quoted for the next quarter at 4.25c., Cleveland and Pittsburgh, for No. 20 gage and 4.40c. for No. 22 gage, an advance of \$2 a ton. Specifications, which recently showed a lull, are now coming out somewhat heavier as automobile plants are ordering material for increased production schedules in December. Mills making narrow strip are crowded with orders, but the situation is easier with wide strip mills because of the large capacity. Shipments have been held up temporarily by a leading Detroit automobile manufacturer because material was coming in too fast.

Semi-Finished Steel.—Specifications are holding up to the recent heavy volume. The leading Cleveland producer, which recently advanced prices to \$34, Cleveland and Youngstown, for sheet bars, billets and slabs, is still adhering to that quotation for the three products, although Youngstown mills have come out with a \$33 price on large billets and slabs.

Bolts, Nuts and Rivets.—The demand is not as heavy as in October,

which is evidently due to the slowing down in the automotive industry. There are indications that the present discount of 70 per cent off list will be re-established for the first quarter, although there is a possibility of an advance in wire, which is used for fully half the tonnage of bolts, and also an advance on steel bars for the next quarter. Rivets are moving fairly well.

Fluorspar.—Recent sales have been limited to small lots for filling in during the remainder of the year. While prices have not yet been announced for next year, there are indications that the present \$18 price will be named for gravel fluorspar for the first quarter. This is from \$1 to \$2 a ton above the price consumers paid during the last half of this year.

Old Material.—A Cleveland mill has bought 5000 tons of No. 1 heavy melting steel scrap from dealers and producers at about \$16. This consumer requires a grade of scrap that brings a price well above common grades. Dealers are paying \$15.75 against this contract. The market is steady at recent prices without apparent trend in either direction. The only exception is a decline of 50c. a ton on No. 1

busheling, which goes to the Valley district, there being no local demand. Dealers are paying \$11.25 to \$11.50 for blast furnace scrap. Heavy melting steel is bringing \$17 from dealers in the Youngstown district.

Prices per gross ton delivered consumers' yards:

New York

Pig Iron Business Continues in Good Volume—Some Sales of Sheets at the New Prices

NEW YORK, Nov. 20.—A steady demand for pig iron is indicated by the week's sales in this district, amounting to over 14,000 tons, and by a good flow of new inquiries. The upward trend of pig iron prices has halted and, if anything, the tone of the market is easier. While the base price of \$18, Buffalo, on foundry iron appears to be holding fairly well, silicon differentials have been waived in some instances. The Thatcher Co., Newark, N. J., has closed for 4000 to 5000 tons, part of which covered a stock of barge iron stored at a New Jersey port. The Farrell-Birmingham Co., Ansonia, Conn., has bought 1500 tons, and the Worthington Pump & Machinery Corporation has concluded purchases against its inquiry for 2605 tons for various plants. The General Electric Co. has placed 175 tons of No. 2X for its Bayway, N. J., plant and is understood to be in the market for other plants. The Newbury Mfg. Co., Monroe, N. Y., is inquiring for 300 tons of foundry iron. Other pending business includes 2000 tons for the remainder of this year and possible additional tonnage for the first quarter, also a lot of 1500 tons for the first quarter and a third lot of 1000 tons for next quarter. Sizable supplementary requirements are indicated by scattered inquiries for smaller ton-

nages for delivery this year. Current demand, however, is mainly for 1929.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$22.91
*Buf. No. 2, del'd east. N. J.	21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	\$21.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	22.39 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania. *Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Quotations for spiegeleisen in carload lots have been advanced \$1 per ton. The 19 to 21 per cent alloy is now quoted at \$34, furnace, with the 16 to 19 per cent quoted at \$33. These quotations are effective at once. Several contracts involving large tonnages for next year's delivery have been renewed at prices which prevailed early this year. In ferromanganese there is some buying of carload and small lots and also further contracting for 1929 delivery, all at \$105, seaboard basis.

Reinforcing Bars.—Distributers in this territory have advanced New York warehouse prices \$1 a ton and are now quoting 2.85c. per lb. for lots of 5 tons or more, 3c. for lots of 2 to 5 tons and 3.25c. for less than 2 tons, all delivered at job. Mill prices are unchanged at 2c., Pittsburgh, for

Sheets and Strips.—Advances of \$2 a ton on all finishes of sheets for first quarter and spot shipment have apparently been general in this district, and there have been a few small sales to cover current needs at the new levels, namely 2.85c. per lb., Pittsburgh, for black, 3.60c. for galvanized, and 2.10c. for blue annealed sheets. Some large consumers are also negotiating for first quarter requirements and mills are generally firm in quoting the new levels. Some opposition to the prices is being encountered in the case of jobbers who are forced to accept a lower discount than was formerly allowed. Specifications came in at a slightly better rate during the last week than in the earlier days of the month, but November business will show a considerable falling off from October unless the last few days of the month prove to be unusually active. Cold-rolled strip is quoted at 2.85c. to 2.95c., Pittsburgh or Cleveland, with the higher quotation obtainable on most of the new business. Demand is not active. Hot-rolled strip is also quiet, with 1.90c. the ruling quotation on widths of more than 6 in. and 2c. obtainable on the narrower widths.

Plates, Shapes and Bars.—Small-lot buyers of bars who are not covered by contract are now paying 2c., Pittsburgh, in almost all cases. Most of the larger buyers are taking regular shipments on contracts which were made at 1.90c. and 1.95c., Pittsburgh. The plate market is quiet, but a good deal of work in pipe lines and shipbuilding is in prospect. The usual price for plates is 2.27½c. per lb., delivered New York, but on sizable orders the quotation is frequently 2.22½c. Small-lot buyers, however, are paying 2.32½c. No large contracts for structural steel have been closed in the week, but mills and fabricators are figuring on a large aggregate tonnage.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Warehouse Business.—Jobbers report a fair volume of buying and prices steady except for continued shading on black and galvanized sheets. Concessions on galvanized sheets range from \$2 to \$3 a ton on desirable orders. Business has improved slightly since election, but the month is not expected to reach the total of tonnage shipped from stock in October.

Cast Iron Pipe.—Northern makers of pressure pipe are maintaining the recent price advance, but the volume of new inquiry continues rather small. Stamford, N. Y., has been accepting bids on about 420 tons of 10-in. Classes A and B water pipe and there is some export inquiry. A large export house dealing with South American markets has asked for prices on 396 metric tons of 4, 6, 8, 10 and 12-in. water pipe and about 15 tons of fittings for Peru, and a New York construction company is reported in the market for about 15,000 tons of pipe for export to South

America. Much of the current domestic business is still limited to small lots to complete installations, such as the purchase by Geneva, N. Y., of about 70 tons of 8-in. water pipe from the McWane Cast Iron Pipe Co.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Consumers in this district using by-product and special beehive brands of foundry coke have in most cases covered their requirements for first quarter or first half of next year. Connellsville producers have adopted a firmer attitude, but desirable tonnages still bring out concessions from the quoted prices. Standard foundry ranges from \$3.50 to \$3.75 per ton, Connellsville, and standard furnace from \$2.85 to \$3.05, Connellsville. Special brands of foundry coke are quoted at \$4.85 per net ton, ovens, or \$8.56, delivered to northern New Jersey, Jersey City and Newark and \$9.44 to New York or Brooklyn. By-product foundry coke prices are \$9 to \$9.40 Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Iron and steel scrap contracts are being completed by brokers, who report no difficulty in obtaining a plentiful supply of material at present prices. New buying by consumers is still limited to small

lots at prices that show a tendency to decline. No. 1 heavy melting steel is being purchased by brokers at \$14 to \$15 per ton, delivered. Yard grade of heavy melting steel is being bought at \$11.75 to \$12 per ton, delivered, but only a small tonnage is moving to consumers on old contracts. Stove plate is quoted at \$12 per ton, delivered to a Phoenixville, Pa., consumer and machine shop turnings at \$11 to \$11.25 per ton, delivered to the same mill. Dealers point out that stocks of scrap on consumers' yards are not large.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.75 to \$12.00
Heavy melting steel (yard)	8.25 to 8.50
No. 1 hvy. breakable cast.	11.25 to 11.75
Stove plate (steel works)	8.50
Locomotive grate bars...	8.75 to 9.25
Machine shop turnings...	7.50 to 7.75
Short shoveling turnings..	7.25 to 7.75
Cast borings (blast furn. or steel works).....	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought...	12.25 to 12.75
No. 1 yard wrot., long....	11.25 to 11.75
Rails for rolling.....	13.00 to 13.50

Cast borings (chemical)...	11.25
<i>Prices per gross ton, deliv'd local foundries:</i>	
No. 1 machry. cast.....	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.).....	14.50

Germany Develops Chromium Plating Preliminary Coating of Non-Ferrous Metal on Steel Makes Even Plating and Prevents Chipping Under Stress

HAMBURG, GERMANY, Oct. 20.—Chromium plating has developed more slowly in Germany than in other countries, although German manufacturers are combined in the Chrom-Interessen-Gemeinschaft and are constantly exchanging experimental information with the American Chromium Corporation and British companies. Plating with chromium has not met with great success in Germany, as it is claimed that the plating chips too easily when the steel is undergoing a severe test or is used as a cutting material. It is further stated by the manufacturers who have experimented with chromium-plated steel that it is impossible to determine that all parts of the material being plated will receive a uniform coating of about 1/100 mm. Microscopic tests are said to have proved that the plating on steel varies from 1/80 to 1/150 mm. It is also claimed that chromium suffers decidedly from fatigue, especially when it is plated on steel in constant and regular use.

Experimentation is understood to show that copper and brass, plated with chromium, do not develop the unsatisfactory defects of steel. The plating has been found to range in thickness from 1/95 to 1/105 mm. and does not chip, even when submitted to a severe test. Following recent experiments, steel has been

coated with a thin plating of copper or cadmium, after which it is chromium plated. In this way, chromium-plated steel has been found to meet as severe tests as non-ferrous metals. This treatment increases the cost of production and experiments continue in an effort to cheapen output.

It has also been found that a variety of colors in the chromium plating is obtainable by changing the electric current in the bath. Milky, gray, bright or dull silver plating has been developed, and an effort is being made to produce both red and gold tints by this method.

Makers are understood to be considering the production of wire, coated with cadmium and plated with chromium, to export to the African native trade, which consumes large quantities of copper and aluminum wire in making jewelry, such as arm and leg bands. The cost would be about 50 per cent less than copper or aluminum wire, and its non-corrosive quality should be an attractive feature.

Joseph T. Ryerson & Son, Inc., Sixteenth and Rockwell Streets, Chicago, with plants in a number of large cities, has taken the agency for portable electric tools manufactured by the Millers Falls Co., Millers Falls, Mass.

Pacific Coast

Steel Inquiries More Numerous—Price Situation Firmer— 800 Tons of Plates for Oil Tanks

SAN FRANCISCO, Nov. 17 (*By Air Mail*).—While awards of iron and steel products on the Pacific Coast this week were not heavy, inquiries are more numerous and a considerable tonnage is pending. The outstanding letting called for 800 tons of plates for two additional 134,000 bbl. oil storage tanks for the General Petroleum Corporation at Los Angeles, placed with the Western Pipe & Steel Co. The price situation is somewhat firmer, save in out-of-stock prices on reinforcing steel bars in the Los Angeles and San Francisco districts.

Pig Iron.—Bids were opened this week on 300 tons of No. 2 foundry iron for the Quartermaster Supply Officer at Fort Mason, San Francisco, but no award has been made. A shipment of several hundred tons of Indian pig is due to arrive on the Coast the latter part of this month. Imports of iron in August totaled 2383 tons.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil.	2.75 to	
3.25		25.00 to 26.00
**Indian fdy., sil.	2.75 to	
3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—The largest letting called for 225 tons for a hotel at Santa Cruz, Cal., booked by the Truscon Steel Co. An award of 1800 tons for the Life Science Building at Berkeley will be made within a few days. Pending business exceeds 7000 tons. Imports of bars during August totaled 2388 tons, compared with 3615 tons for the previous month and 3638 tons for August a year ago. Out-of-stock quotations on reinforcing bars continue at 1.80c., base, in San Francisco and Los Angeles districts. Merchant bars appear to be firm at 2.30c., c.i.f. Coast ports.

Plates.—In addition to two 134,000 bbl. tanks for the General Petroleum Corporation, Los Angeles, requiring 800 tons, awarded to the Western Pipe & Steel Co., the Llewellyn Iron Works secured 370 tons for a 40-in. pipe line for Los Angeles; the Pacific Coast Engineering Co. booked 185 tons for 20-in. shore pipe for the United States Engineer office, San Francisco, and the Bethlehem Shipbuilding Corporation took 340 tons for

two barges and one tug boat, the tug boat and one barge being for the Inter-Island Steam Navigation Co., Honolulu. Bids were opened this week on 550 tons for a 24-in. riveted pipe line at Seattle. Vancouver, B. C., will open bids on Dec. 11 for 125 tons of 18-in. pipe. Prices continue firm at 2.25c., c.i.f., as a minimum.

Shapes.—The California Steel Co. was awarded 103 tons for a factory in Oakland and the Bethlehem Shipbuilding Corporation booked 106 tons for a barge for the Inter-Island Steam Navigation Co., Honolulu. Inquiries include 1500 tons for an apartment in San Francisco and 425 tons for a saw mill for the Weyerhaeuser Lumber Co. in Washington. Imports in August totaled 1745 tons, compared with 1428 tons in July and 3067 tons in August, 1927. Of the total, 1418 tons was taken by San Francisco fabricators. Plain domestic shapes are firm at 2.35c., c.i.f., while foreign shapes are about 1.60c., c.i.f., duty paid.

Cast Iron Pipe.—Little improvement in demand for cast iron pipe has oc-

curred recently, and awards this week did not exceed 600 tons. Phoenix, Ariz., placed 164 tons of 2 to 12-in. Class B pipe with an unnamed maker. Watson & Sutton took 106 tons of 4 to 10-in. Class B pipe for the improvement of Turquoise Street, San Diego, and L. Coluccio took 305 tons of 30-in. Classes A and B pipe for the improvement of East Olive Street, Seattle. Bids were opened this week on 1640 tons of 24-in. Class B pipe for Seattle, and on 111 tons of 12-in. Class B pipe for Aberdeen, Wash. The only new inquiry of importance calls for 548 tons of pipe for the improvement of Arlington Street, Los Angeles, bids on which will be opened Dec. 3. During August 2174 tons of pipe was imported on the Coast, compared with 4135 tons in the preceding month and 4211 tons in August, 1927.

Steel Pipe.—Bids were opened this week on 102 tons of ¾-in. and 1-in. galvanized pipe for Los Angeles. No outstanding pipe line tonnages are up for figures. Imports of tubular products in August were 3833 tons, compared with 2157 tons in July and 1794 tons in August a year ago.

Coke.—A shipment of 4000 to 5000 tons of English by-product and bee-hive coke is due to arrive late this month. Coke importations in August totaled 10,543 tons, compared with 4659 tons in July and 8115 tons in August a year ago.

St. Louis

Pig Iron and Scrap Markets Continue Strong—Sheet Mills Active—10,000-Ton Rail Order Placed

ST. LOUIS, Nov. 20.—Sales of pig iron by the St. Louis Gas & Coke Corporation during the last week totaled 8700 tons, including 5000 tons of basic to an East Side melter for shipment during the remainder of 1928 and 2000 tons of malleable to a northern Illinois melter and 3700 tons of foundry iron for first quarter shipment. Of the foundry iron, a Kansas melter and a local machinery manufacturer took 500 tons each, and 400 tons will go to a northern Illinois consumer. The melt in the district continues heavy, with especial activity by car building, implement and stove interests, the latter enjoying one of the best seasons in years. The Granite City maker is now quoting malleable iron 50c. a ton higher than the foundry grade. That company expects to blow in on Dec. 1 its second furnace, which has been idle several months for relining and other repairs. Southern makers have opened their books for first quarter at an advance of 25c. a ton.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.	
Granite City, Ill.		\$20.00
Malleable, f.o.b. Granite City		20.50
N'th'n No. 2 fdy., deliv'd St. Louis		22.16
Southern No. 2 fdy., deliv'd		20.92
Northern malleable, deliv'd		22.16
Northern basic, deliv'd		22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Finished Iron and Steel.—The Granite City Steel Co. has advanced sheet prices \$2 a ton, in line with similar action by Chicago and Eastern mills. While the demand for sheets has fallen off since the first of the month, the Granite City company has sufficient bookings to operate its sheet mills at full capacity. Five of the steel company's 20 tin mills are down for repairs. Business in tank plates is dull. Warehouse business is about on a par with last week's volume. Struc-

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	 3.25c.
Bars, soft steel or iron	 3.15c.

tural fabricators are operating on a large number of small orders.

Rails and Track Supplies.—The Missouri-Kansas-Texas has bought 10,000 tons of 90-lb. rails for 1929 from the Inland Steel Co., Bethlehem Steel Co., Illinois Steel Co. and Tennessee Coal, Iron & Railroad Co. The Wabash has issued an inquiry for its rail requirements for 1929, but no tonnage is stated.

Old Material.—As the result of orders for railroad cars being placed or in prospect, purchases of a limited tonnage of specialties and rails were made during the week by several companies. However, mills and dealers cannot agree on prices, some mills endeavoring to buy old material at the market prevailing 30 days ago. Advances of 25c. a ton were made this week on miscellaneous standard-section rails, railroad springs, railroad malleable and rails for rolling. Railroad lists include: Southern, 8200 tons; Chicago & Alton, 1165 tons; In-

ternational Great Northern, 620 tons; New Orleans & Great Northern, 100 tons, and Nickel Plate, 34 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel.....	\$13.25 to \$13.75

Cincinnati

Alabama and Tennessee Iron Up 25c—Jackson County Silvery Advanced \$2—Scrap Declines

CINCINNATI, Nov. 20.—Interest in the pig iron market centers in the upward trend of prices. Alabama and Tennessee makers have advanced quotations 25c. a ton to \$16.50, base Birmingham, and there is a possibility of a further increase of 50c. Closely following the announcement by Southern producers has come an advance of \$2 a ton on all grades of Jackson County silvery iron and Bessemer ferrosilicon, the new schedule specifying a price of \$27, base Jackson, for 8 per cent. Pig iron sales in the past week totaled about 5000 tons, divided almost equally between Northern and Southern iron. Bookings included 2000 tons of Northern foundry for an Indiana melter, 500 tons for each of two Ohio consumers, and 600 tons for a central Ohio company. The growing number of inquiries indicates that many buyers are watching the market closely to prevent the necessity of paying higher prices for first quarter requirements. Pending business includes 5000 tons of foundry for a central Indiana company, 800 tons for a local melter and 700 tons for a Greenville, Ohio, company. Reports are that the Marting Iron & Steel Co., Ironton, Ohio, will blow in a blast furnace soon to convert into pig iron a considerable quantity of ore remaining on its yards. If this furnace is put into operation, it is likely to be for only a short run. Southern Ohio foundry iron remains nominally at \$18.50, base Ironton.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25.....\$20.39
Ala. fdy., sil. 1.75 to 2.25..... 20.19
Ala. fdy., sil. 2.25 to 2.75..... 20.69
Tenn. fdy., sil. 1.75 to 2.25..... 20.19
S'th'n Ohio silvery 8 per cent..... 28.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—By-product foundry coke specifications continue to lag considerably behind those of October. The curtailment of demand is partly attributed to a reduction in the melt of foundries associated with the automobile industry, although lessened requirements by consumers are reported to be rather general. Domestic grades are moving in liberal volume. Wise County beehive foundry coke is quoted at \$4.25 to \$5.25, ovens, with furnace coke selling at \$3.50. New River beehive foundry coke is firm at \$6 to \$6.50, ovens.

Finished Material.—Steel sheet specifications turned upward the past week, with the result that mills in this district added somewhat to their unfilled tonnage. Much of the business came from automobile companies, which again are releasing substantial shipments. However, bookings from other sources also have been satisfactory and mill operations are being sustained at practically 100 per cent

Warehouse Prices, f.o.b. Cincinnati

of capacity. The American Rolling Mill Co. has announced an advance of \$2 a ton on all grades of sheets, the new schedule calling for 2.10c., base Pittsburgh, on blue annealed; 2.85c. on black; 4.10c. on automobile body stock, and 3.60c. on galvanized. Makers of cold-rolled strip steel are asking 2.85c. to 2.95c., base Pittsburgh or Cleveland, while hot strip steel is on a basis of 1.90c., Pittsburgh, for material from 6 to 24-in. wide. Structural steel fabricating shops are in need of work, recent lettings having been small. Bars, shapes and plates are being sold in carload lots at 2c., base Pittsburgh, but larger tonnages are being taken at \$1 a ton less.

Old Material.—Heavy melting steel has declined 25c. a ton and other items have dropped 25c. or 50c. Despite the downward trend of prices, dealers are of the opinion that quotations will remain close to their present level during the remainder of the year on account of the high rate of consumption by steel plants and other users of scrap.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.00 to \$13.50
Scrap rails for melting....	13.25 to 13.75

Detroit

Automobile Production Declines

DETROIT, Nov. 20.—The dropping off in automobile production in the Detroit area is having its effect on industry in general and on steel bookings in particular.

The labor barometer, which is a statement of the combined payrolls of representative firms constituting two-thirds of the city's industrial population, shows a decrease this week of 1936, with a present total of 297,737. Over the last four weeks, all of which showed a decrease, the average is found to be about 3400 per week. The present total, however, is still very much higher than that of a year ago, which was 194,301.

October shipments of the Buick Motor Car Co. set a new record, at 28,614, a gain of 1814 units over the previous month.

W. S. Knudsen, president Chevrolet Motor Car Co., in announcing the new six-cylinder model, estimates full production by Dec. 15. The schedule for December is tentatively set at 32,000 units. This will be increased in January to 104,000 units. Mr. Knudsen estimates that 1929 production will amount to 1,500,000 units.

The Chrysler Corporation in October sold 60,000 cars, which sets an all-time record. For the remainder of the season, however, it is expected that a reduction in the production rate will be ordered.

The Ford Motor Co. has reached a daily production rate of 6000 units, an increase of approximately 500 per day over the September figure. Total production for October was 106,404 units.

Graham-Paige set a record in October, with production of 4921 units.

The Hupp Motor Car Co. turned out 4129 cars in October, setting a new record.

The Oakland Motor Car Co.'s production for October was 17,232 cars, 1614 units greater than in the same period a year ago.

The Olds Motor Works shipped 7288 units during October, an increase of 73 per cent over the same figure of a year ago.

The Packard Motor Car Co. shipped 5802 cars in October, setting a new record and surpassing the figure of 5001, made in August of this year. The November schedule is 5500 units.

The Reo Motor Car Co. is preparing to introduce a new model, which in price range will drop in just under the Flying Cloud. It is stated that this car is to be built on entirely new

lines. Public announcement, however, will probably not be made before the middle of next month.

The Continental Motors Corporation is maintaining its high production schedules this month, and the same rate will probably be continued during December. This is the result of a large increase in demand for automobile motors and a standing order for 1000 crankshafts per day for the Ford Motor Co. T. M. Simpson, secretary of the company, believes that 1929 will surpass 1928 production.

The pig iron melt in the district is showing a slight tendency to decrease, owing to the seasonal slowing up in production among automobile producers. This will probably be offset in December with the bringing out of several new models by large makers.

Scrap prices are the same as quoted a week ago.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov.	
steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50

Cast iron borings, chem...	13.50 to 14.00

Canada

Car Orders Stimulate Demand for Steel

TORONTO, ONT., Nov. 20.—The placing of more than \$20,000,000 worth of rolling stock orders by the two leading Canadian railroads has had a stimulating effect on steel business. Steel mills, foundries and other companies will benefit by the railroad buying. Large orders have been placed for sheets by Canadian automobile plants. Foundries have closed contracts that will keep them busy well into the new year. Considerable business in wire and chain rods is pending. Sales of these products this year have reached new high levels. Belgian wire rods are less prominent in the Canadian markets this year than in recent years.

Pig Iron.—Foundries are taking keen interest in the market, and new inquiries have recently appeared from a number for foundry and malleable iron for spot and future delivery. Sales for the week were larger than those of several past weeks. Some inquiry for first quarter is appearing, but so far producers are not encouraging business beyond the end of the year. While there has been no change in Canadian pig iron prices, shading has disappeared, and there are strong possibilities that the Canadian quotation will be at least \$1 per ton higher for first quarter.

Prices per gross ton:

Summerlee	33.50
Carron	33.00

Structural Steel.—Canadian fabricators report a steady flow of new orders. The Manitoba Bridge & Iron Works, Winnipeg, Man., has received an order for 1500 tons of structural steel from the Canadian National Railways for bridge construction. Business pending includes 2000 tons for the Hudson Bay Co. store at Calgary, Alta.; 250 tons for technical school at Oshawa, Ont.; 5000 tons for

Birmingham

Southern Pig Iron Advanced 25c. Per Ton—Ensley Rail Mill to Resume Operations

BIRMINGHAM, Nov. 20.—Merchant producers of pig iron opened their books on Nov. 15 for first quarter at the base price of \$16.50 for No. 2 foundry. This advance of 25c. per ton is effective on sales for iron to be delivered during the remainder of the year as well as for first quarter. There has been no buying rush for first quarter iron, but furnace interests report several orders in round tonnage. The advance was not as large as was generally expected, and another increase before the end of the year is predicted by some. Very little iron has been stocked so far this month. No change in furnace operations has occurred during the past three weeks. Eighteen furnaces are in blast, of which 13 are on foundry, four on basic and one on ferromanganese. Work has been completed on the new No. 1 city furnace of the Sloss-Sheffield Steel & Iron Co., but no date has been announced for its operation.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.50
No. 1 fdy., 2.25 to 2.75 sil.....	17.00
Basic	16.50

Finished Steel.—The Ensley rail mill of the Tennessee company will resume operations on Nov. 24. One of its largest orders is 65,000 tons of 100-lb. rails for the Louisville & Nashville, reported in these columns several weeks ago. Bookings of bars, plates and shapes during the first half of November have been up to the high

volume of the last half of October. Mill schedules in all departments are heavier than at any time in the past several seasons. Buyers are protecting themselves a little farther ahead in some lines, owing to the lengthening of deliveries. Quotations continue firm and unchanged. Fabricated structural steel plants report only one new order above 100 tons, 200 tons booked by the Southern Steel & Rolling Mill for the American Cast Iron Pipe Co. Reinforcing bar orders have been light for the past two weeks. The Alabama highway department will open bids on Nov. 26 for 487 tons of reinforcing steel. Open-hearth operations are unchanged; the Tennessee company has seven active at Fairfield and five at Ensley and the Gulf States Steel Co. four at Alabama City.

Cast Iron Pipe.—The market is quiet and shows no indications of improvement before the end of the year. Plants are operating at about 50 per cent of capacity. The volume of shipments has dropped a little, but is still fairly good for this season. Makers are holding closely to the new base prices of \$37 to \$38 on 6-in. and larger sizes.

Coke.—Requisitions on contracts are fairly good, but new business is quiet. First quarter requirements were well covered in the buying movement several weeks ago. Domestic coke sales have improved slightly. Quotations are unchanged; \$5 is the base for both spot and contract.

Montreal University building at Montreal, Que.; 2500 tons for hotel building at Government and Belleville Streets, Victoria, B. C. Several large building projects recently announced for Toronto, including an addition to the T. Eaton Co. store, the Canadian Bank of Commerce Building and others, bring the total prospective demand for structural steel in this city alone to well over 25,000 tons.

Old Material.—Mills, foundries, sanitary ware and radiator makers, electric furnaces and various other consumers are showing keen interest in the market and their orders are increasing both in number and quantity. The demand affects practically all grades of scrap. Dealers are buying more extensively both for yard stocks and direct shipment to consumers. Bidding has been keen for a supply of scrap offered by the Toronto Electric Commission. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel....	\$9.50	\$7.00
Rails, scrap	10.00	9.00

Butler Mfg. Co. Begins Aircraft Production

The Butler Mfg. Co., Kansas City, Mo., fabricator of sheet steel products and long identified with the aircraft industry through the manufacture of steel hangars and other airport equipment, has announced the formation of the Butler Aircraft Corporation to act chiefly as a selling organization for the airplanes and airplane equipment to be manufactured by the parent company. A large section of the company's plant in Kansas City has been set aside for the new manufacturing division, and production on two types of planes has already begun. Later the company expects to bring out other types of planes and accessories, with all-metal craft as the final development.

In commenting upon the new company, E. E. Norquist, president and general manager of the Butler organization, stated that the company's "early experience with airplane transportation, its contact with the aircraft industry and the trend toward a wider use of metal in aircraft construction all were important factors in prompting its entry into the manufacture of airplanes."

Boston

Pig Iron Firm—Scrap Sales Fall Off, with Some Recession in Prices

BOSTON, Nov. 20.—Pig iron sales the past week totaled 8000 tons. In the absence of open inquiries for attractive tonnages, prices appear firmer. Eastern Pennsylvania iron has been marked up 50c. a ton. Buffalo furnaces are maintaining their recent price advance. Other New York State iron and Mystic iron are firmly held at delivered prices equivalent to those on Buffalo iron.

Finished Material.—Indications are local steel mill representatives will book a slightly larger tonnage of finished material this year than in 1927 despite the fact that New England railroads have bought less material this year and that a large tonnage going into New England-made parts for Ford cars has been purchased outside these States. With the exception of shapes, all kinds of material will show an increase. The market on steel bars is 1.95c. to 2c. per lb., base Pittsburgh. Standard shapes are generally 1.95c. to 2c. per lb, Pittsburgh base, but on a large tonnage 1.90c. undoubtedly could be done.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$22.91
*Buffalo, sil. 2.25 to 2.75..	23.41
†Buffalo, sil. 1.75 to 2.25..	21.78
†Buffalo, sil. 2.25 to 2.75..	22.28
East. Penn., sil. 1.75 to 2.25..	\$24.15 to 24.65
East. Penn., sil. 2.25 to 2.75..	24.65 to 25.15
Va., sil. 1.75 to 2.25.....	26.91
Va., sil. 2.25 to 2.75.....	27.41
Ala., sil. 1.75 to 2.25.....	23.41 to 25.27
Ala., sil. 2.25 to 2.75.....	23.91 to 25.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Coke.—Foundry coke specifications are increasing, indicating a larger iron melt. The New England Coal & Coke Co., the Providence Gas Co. and the Koppers Co.'s New Haven, Conn.,

subsidiary all quote \$11 a ton, delivered within a \$3.10 freight rate zone. Warm weather the past week caused a drastic slump in retail buying of domestic coke, yet there was no check in the movement from ovens to yards. New England ovens are still meeting stiff competition from plants located elsewhere.

Old Material.—A further recession in the movement of old material out of New England is noted. Prices for specification pipe, T and girder rails and mixed borings and turnings have declined. The market for forge scrap is firmer on buying for shipment to a Worcester consumer. Exports of scrap is still held up by a scarcity of steamship space.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$10.50 to \$11.00
Scrap T rails.....	10.00 to 10.50
Scrap girder rails.....	9.00 to 9.50
No. 1 railroad wrought....	11.00 to 11.50
No. 1 yard wrought.....	9.00 to 9.50
Machine shop turnings....	6.00 to 6.50
Cast iron borings (steel works and rolling mill).	6.00 to 6.50
Bundled skeleton, long....	9.00 to 9.25
Forge flashings	9.50 to 9.75
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	7.00 to 7.25
Shafting	14.50 to 14.75
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling.....	11.00 to 11.50
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$14.00 to \$14.50
No. 1 machinery cast.....	15.00 to 15.50
No. 2 machinery cast.....	13.00 to 13.50
Stove plate	11.00 to 11.50
Railroad malleable	15.50 to 15.75

Structural Steel Shipments Make New Record

WASHINGTON, Nov. 20.—Orders for fabricated structural steel in October totaled 184,643 tons, or 64 per cent of the monthly capacity of 290,290 tons of the 198 firms reporting to the Department of Commerce. Computed bookings were 240,000 tons. The actual bookings reported were the smallest since January, when the total was 172,284 tons, while the computed orders were the smallest since April, with a total of 236,250 tons. Actual bookings reported in September amounted to 256,811 tons, or 85 per cent of the capacity of the 221 reporting firms, while computed bookings were 318,750 tons.

Computed shipments in October were 330,000 tons, or 88 per cent of estimated total capacity of 375,000 tons for the entire industry. The October computed shipments established a record since the Department began keeping such figures in 1924. Computed bookings for the 10 months ended October totaled 2,797,500 tons, against 2,568,750 tons for the corresponding period of last year, while computed shipments were 2,625,000 tons and 2,407,500 tons respectively.

Buffalo

Pig Iron Sold at Recently Advanced Prices—Scrap Slightly Weaker—Steel Mills Busy

BUFFALO, Nov. 20.—Pig iron inquiries in this district totaled between 6000 and 7000 tons. A good deal of iron has been purchased without the formality of an inquiry by melters, who seem convinced the market is firm at present prices. One of the inquiries was for 2500 tons of foundry and malleable; another for 1500 tons of foundry and another for 1000 tons of foundry, all from points eastward. The quotation of \$18, Buffalo, for No. 2 plain for delivery outside this district is being maintained and the malleable for similar delivery is being held at \$18.50. For district delivery \$18.50 is being adhered to for No. 2 plain. Furnace operations are unchanged. Ten furnaces are in blast.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	\$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75	18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25	19.50 to 20.00
Malleable sil. up to 2.25	18.50 to 19.00
Basic	17.50 to 18.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—A high rate of operation is being maintained by district mills. Bar and shape prices are firm; specifications are good. Sheets show firmness at the new prices, and bookings assure heavy operation for some weeks. Reinforcing bar business has dropped off; the price is 2.515c., warehouse. Wire sales are keeping mill operations at 75 per cent. Warehouse business has improved steadily.

Old Material.—A small tonnage of No. 1 heavy melting steel was purchased by one of the principal users the past week at a price said to have been \$16.50, or 50c. under its larger purchases of a month ago. This is the price also being offered by dealers for delivery to the buyer. Shipments to this interest are still being regulated, but the restrictions are not so severe. Important purchasing by two of the largest plants in the district is expected within a week or two. During the past week there have been some sales of knuckles and couplers and steel car wheels at \$17.50 and a few small sales of No. 1 machinery cast at \$15.75 to \$16. The out-of-town market is not quite so strong and this is reflected in the local market. A smaller demand from Youngstown and Pittsburgh has created a larger supply of No. 2 steel in particular, the

shortage of which has been felt in this district. A blast furnace interest came into the market during the week for borings and turnings, paying \$11 to \$11.50.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$15.50 to \$16.50
No. 2 heavy melting steel.	14.25
Scrap rails	15.50 to 16.00
Hydraulic comp. sheets	14.25
Hand bundled sheets	12.00 to 12.50

Department of Commerce to Test Airplane Joints

WASHINGTON, Nov. 20.—A comprehensive investigation of the strength and other properties of all the joints and fittings entering into the construction of the airplane from the standpoints of both safety and efficiency in design has been undertaken by the Aeronautics Branch, Department of Commerce, according to the annual report of the director of aeronautics. It is pointed out that the fuselage of many modern airplanes is constructed of seamless steel tubing welded at the joints and that an accurate knowledge of the strength and other properties of the joints and fittings is essential. Copies of the program, including blue prints of all the proposed joints, were sent to aircraft manufacturers and designers. Comments and criticism were invited.

The replies showed much interest in the investigation and contained many practical suggestions as to additions and modifications to be made in the program. The program includes 134 different joints. In addition to specimens made by cutting and fitting the tubes closely, then welding the joint, a number of joints are

included in which reinforcing members of various kinds are used. The material used for the most of the specimens will be chrome-molybdenum steel. The welding is done in a special jig adjustable to fit any proposed specimen. In order that the operation of making the weld may be uniform for all joints, a procedure control prepared by the American Bureau of Welding will be followed. By systematically varying the design of the joints and noting the effect on the strength, weight, and cost the most efficient types of joints will be determined.

Fuller & Johnson Mfg. Co. Under New Ownership

Second Ward Securities Co., and the Quarles Co., associated investment security concerns of Milwaukee, have announced the purchase of the Fuller & Johnson Mfg. Co., Madison, Wis., manufacturer of farm engines and small industrial power units up to 20 hp. The capital structure of the concern, the assets of which are valued at \$1,000,000, is being changed to 66,000 shares of common stock without par value, in addition to which there is a first mortgage bond issue of \$290,000. Executive personnel and management will remain virtually unchanged, C. L. McMullen continuing as president. The directorate will be enlarged to include representatives of the securities companies as well as of the Waukesha Motor Co., Waukesha, Wis., which is identified with the transfer. The Fuller & Johnson company for some time has operated under license from the Waukesha company in using the Ricardo high-turbulence cylinder head for internal combustion engines. The Waukesha concern manufactures motor truck, tractor and industrial power units from 25 hp. upward. While the Madison concern will continue to build farm engines, it will greatly develop its line of small industrial engines, supplementing the heavier line made by the Waukesha company. Origin of the Fuller & Johnson company dates back to 1840.

New Chromium Plating Plant Ready

The Chromium Engineering Corporation of America, with executive offices at 246 Fifth Avenue, New York, announces that its large chromium plating plant at 132-134 West Twenty-second Street, New York, will be open and ready for business Nov. 26. Equipment and facilities large enough to chromium plate anything from a pin to automobile bumpers, radiators, shells, etc., have been provided. It is the intention to handle the chromium plating work for manufacturers and job shops who are not ready to instal their own plating plant. The plant will be operated 24 hr. a day to insure prompt delivery.

Non-Ferrous Metal Markets

Copper Moderately Active and Firm, Tin Sales Large, Lead Steady with Zinc Quiet and Unchanged

NEW YORK, Nov. 20.

Copper.—Buying by domestic consumers has been fairly active the past week, the principal delivery involved being January and February. Some consumers are also buying considerable December metal, which is regarded as an indication that consumption is increasing, because recently it was thought that they had overbought. There is some interest in March metal, but practically none has been sold. Producers generally are unwilling to sell this position at this time, unless combined with February metal to regular customers. Foreign buying is moderately active, with France and England taking up the slack caused by the strike in the Ger-

man metal trades. Prices continue firm at 16c. for electrolytic copper delivered in the Connecticut Valley and at 16.25c. c.i.f. usual European ports. The Lake copper market is very quiet but firm at 16.12½c., delivered.

Tin.—At 1200 tons sales were fairly large for the week ended Saturday, Nov. 17. The deliveries named were all the way from spot to June. Consumers were quite active in their purchases of spot and distant deliveries, while dealers took the intermediate positions, including November and December. Yesterday the market was again active, with consumers taking about 500 tons, and today buying has been fairly liberal, with 400 to 500 tons changing hands. The announcement of the price of tin plate has been one cause of the greater activity on the part of consumers, it usually being their custom to buy after this matter

is settled. Spot Straits tin today was quoted at 51.12½c., New York, and London prices were about £2 per ton higher than a week ago, with spot standard quoted £231 17s. 6d., future standard at £227 15s. and spot Straits £232. The Singapore price today was £230 10s. Arrivals thus far this month have been 2550 tons with 6040 tons afloat.

Lead.—Producers report a good volume of sales, particularly in the West where prices are a little easier. Yesterday lead changed hands at 6.15c., St. Louis, but today the market is firmer at 6.17½c. December delivery is principally involved. Large interest centers in the formation last week of the Lead Industries Institute and the effect this may have on steadying the market.

Zinc.—This market is featureless with buying reported as moderately

Non-Ferrous Rolled Products

Mill prices on lead full sheets, having remained at one level since May 29, were advanced ¼c. per lb. on Nov. 15, and are now quoted at 10.25c. to 10.50c., base. Prices on brass and copper products and zinc sheets have not changed.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	20.50c.

active the past week or so. Quotations continue remarkably firm at 6.25c., East St. Louis, or 6.60c., New York, for prime Western for delivery into January and possibly into the first quarter. The price of ore at Joplin was unchanged Saturday at \$40 per ton and statistically the market has slightly improved. For the third successive week the output was 11,000 tons and shipments were larger at over 12,800 tons.

Antimony.—Chinese metal in a very quiet market is quoted today at 10.25c., duty paid, New York, for all positions.

Nickel.—Wholesale lots of ingot nickel are quoted unchanged at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99

per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 20.—Spot sales of tin are in good volume and purchases of copper are active. Prices for tin are higher. The old metal market is steady and sales are moderately active.

Prices, per lb., in carload lots: Lake copper, 16.75c.; tin, 51.12½c.; lead, 6.25c.; zinc, 6.35c.; in less-than-carload lots; antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c. aluminum, 12c., all being dealers' prices for less-than-carload lots.

World Trade Passes Pre-War Volume

Exports of 82 Countries Expanding at One-Half Ante-Bellum Rate

EUROPE has increased its foreign trade more rapidly than any other quarter of the world during the last two years and has now made up all but 10 per cent of the volume of export trade it carried on in 1913. Export growth throughout the world, according to the National Foreign Trade Council, represents a resumption of progress at a little more than half the pre-war rate of increase.

Exports in 1927 for 82 nations conducting 95 per cent of the world's trade, the council states, amounted to \$22,664,000,000 at the 1913 value of the dollar. This figure is about half of what the world's trade would have amounted to had its normal growth been uninterrupted by the war. Between 1900 and 1913 these nations made an annual average growth in exports of 6½ per cent, which would have made their exports last year in normal circumstances a little more than \$44,000,000,000 at the 1913 dollar valuation. The accumulated sum by which the world's exports have, during the past 14 years, fallen short of this normal progress is estimated at about \$145,000,000,000 in 1913 dollars, or more than \$200,000,000,000 today. This total, more than 10 times the debt of the United States, is the cost to world trade of the economic dislocation that accompanied and followed the Great War.

Two years ago the council called attention to the fact that in 1925 for the first time since the war international trade, as measured in exports, had surpassed its volume for 1913. The combined nations, other than the United States, had then made a gain of about 4 per cent, while the United States had made an advance of over 31 per cent.

The figures for 82 nations now disclose an even more satisfactory picture for 1927. They show a real growth of 11 per cent in exports over 1913 for the rest of the world and a

gain of 38 per cent for the United States.

As was inevitable, the recovery of the European nations, now in full swing, has stimulated their exports at a more rapid rate than our own during the last two years. The 27 nations of Europe gained 10 per cent in exports during this interval and have practically attained again the momentum of their pre-war growth. The United States gained about 5 per cent between 1925 and 1927. The significant fact is, however, that the world as a whole, with a real export increase of 6 per cent during the two years, definitely embarked on a new growth in international trade at about half the rate of progress it made before the war.

New Weirton Open-Hearth Ready for Operation

The Weirton Steel Co. has completed and is drying out its No. 12 open-hearth furnace, a 300-ton unit, which will be started early next month. The addition of this furnace will give the company an annual ingot capacity of 1,250,000 tons.

Fabricated Plate Orders Unusually High

WASHINGTON, Nov. 20.—Aggregating 60,482 tons, or 75.7 per cent of the monthly capacity of the 51 concerns reporting to the Department of Commerce, orders for fabricated steel plate in October were the highest since March, 1923, when they amounted to 72,509 tons, or 89.3 per cent of capacity, the highest on record since the Department of Commerce has been receiving the figures. The next highest total was in January, 1923, with orders for 62,892 tons, or 77.5 per cent of capacity.

Of the October orders, 23,960 tons

was for oil storage tanks; 3527 tons for refinery materials and equipment; 1804 tons for tank cars; 1861 tons for gas holders; 2435 tons for blast furnaces, and 26,895 tons for stacks and miscellaneous purposes.

Orders in September totaled 40,281 tons. For the 10 months ended with October bookings were 444,339 tons, or 55.9 per cent of capacity, against 434,708 tons, or 54 per cent of capacity, for the corresponding period of last year.

Freight Rate Decisions

WASHINGTON, Nov. 20.—Rates on iron and steel sheets and plates, in carloads, from Middletown, Ohio, to destinations in Missouri, Oklahoma, Arkansas and Louisiana are not unreasonable or unduly prejudicial, according to a decision made public last Saturday by the Interstate Commerce Commission, which ordered dismissal of a complaint by the American Rolling Mill Co. Present rates from Middletown are from 3c. to 6.5c. per 100 lb. higher than those applicable from Cincinnati, while the rates prescribed in the Southwestern cases are from 4c. to 5c. higher.

The rate on pig iron, in carloads, from Duluth, West Duluth, Minn., and Superior and Ashland, Wis., to Lincoln, Neb., was reduced to \$5.27 per gross ton, minimum 60,000 lb. per carload, from \$5.71, minimum 49,280 lb., in a decision of the Interstate Commerce Commission, made public last Saturday. Reparation was also awarded to the complainant, the Cushman Motor Works, Lincoln. The new rate is to become effective Jan. 10.

Mackintosh-Hemphill Will Build Plant in Ohio

The Mackintosh-Hemphill Co., Pittsburgh, has placed a contract with the Hughes-Foulkrod Co., Pittsburgh, for the construction of a new plant at Wooster, Ohio. When completed, it will house the heavy equipment formerly located in the Pittsburgh plant on Twelfth Street, which was sold a few months ago to the Pennsylvania Railroad for increased terminal facilities. The new building will be of steel frame construction and will require approximately 400 tons of structural steel.

As a final step in the consolidation of the Bucyrus Co., South Milwaukee, with the Erie Steam Shovel Co., Erie, Pa., under the title of Bucyrus-Erie Co., it is announced that the sales offices of the Erie division are being transferred to South Milwaukee, where the executive offices were consolidated some time ago. It is stated by G. A. Morison, secretary of the Bucyrus-Erie Co., that there is no intention of stopping or reducing production at the Erie works, which will be continued as the eastern manufacturing unit.

PERSONAL

W. M. GARRIGUES, for the past seven years assistant general manager of sales for the Central Alloy Steel Corporation, Massillon, Ohio, and its predecessor, has been appointed general sales manager of the company. M. H. SCHMID, for two years assistant sales manager alloy division, has

W. M. GARRIGUES

been made sales manager bar and billet division, and J. S. ANDREWS, formerly assistant district sales manager at Detroit, has been named assistant sales manager sheet and strip division, with headquarters at Massillon.

JOHN A. FITZGERALD, for a number of years associated with Remington-Rand, Inc., Iliion, N. Y., has resigned to become sales manager of the Federal Cash Register Co., Kansas City, Mo.

H. W. KNAPP, St. Louis district sales manager for the McQuay-Norris Mfg. Co., maker of piston rings, has been appointed general sales representative for the entire country, and will continue to maintain his headquarters at the company's general offices in St. Louis. He has been identified with the organization since 1915.

ALFRED C. HOWELL, who some months ago resigned the presidency of the Ames Shovel & Tool Co., Boston, to become associated with the Guaranty Trust Co., New York, has been appointed a vice-president of that company. He began his business career with the Carnegie Steel Co. at Pittsburgh and Cincinnati and later became manager of the steel department of the W. Bingham Co., Cleveland. Subsequently he became a sales manager of the Midvale Steel & Ordnance Co., Philadelphia, and when that company became a part of the Bethlehem Steel Corporation he remained as sales manager of the plate department.

J. H. CHUBB has been appointed manager service bureau, Pennsylvania-Dixie Cement Corporation, with headquarters at 131 East Forty-sixth Street, New York. Mr. Chubb, who is a member of the Western Society of Engineers, the American Concrete Institute and the American Society for Testing Materials, has been active in the work of the committee on technical problems of the Portland Cement Association.

LUCIEN EATON, superintendent of the Ishpeming, Mich., district of the Cleveland-Cliffs Iron Co., Cleveland, has been appointed chairman of the metal mining branch, standardization division, American Mining Congress.

A. W. KOEHLER, who has recently served as executive secretary of the safety council of the Rochester, N. Y., Chamber of Commerce, has been appointed secretary of the National Conference on Street and Highway Safety. Mr. Koehler was graduated from Purdue University in 1916 and was for several years identified with accident prevention and industrial relations work for the Commonwealth Steel Co., Granite City, Ill., and the Atlantic Steel Co., Atlanta, Ga.

R. M. SANDBERG, for 16 years associated with the Columbia Tool Steel Co., Chicago Heights, Ill., has been appointed general manager of that company. In recent years he has been active in the work of the American Society for Steel Treating.

A. J. GATES has been appointed chief sales executive of the Baker-Raulang Co., Cleveland, and will have charge of the distribution of the company's industrial tractors, trucks and cranes. He has been associated with the company for the last 10 years, having had charge of the Ohio and Michigan territory. Mr. Gates was graduated from Purdue University in 1908, and before joining the Cleveland company he was connected with the General Electric Co.

FRANK J. BAUMIS has resigned as president Shaw Crane-Putnam Machine Co., Inc., and as vice-president and director of Manning, Maxwell & Moore, Inc., New York, to become associated on Dec. 1 with the Ingersoll-Rand Co., New York. In his new capacity Mr. Baumis will be identified with the development of the oil-electric locomotive.

PHILIP DRESSLER has been elected president of the American Dressler Tunnel Kilns, Inc., Cleveland, succeeding the late E. H. SWINDELL. He is a son of CONRAD DRESSLER, inventor of the Dressler muffle kiln, and has been actively identified with the American branch of the company

since its inception. PAUL A. MEEHAN, vice-president in charge of engineering for the company, has been elected treasurer but will continue to hold his old position. L. A. VINCENT, associated with the company for eight years, has been named vice-president in charge of sales.

HERBERT W. STONE, vice-president and general manager of the United States Hoffman Machinery Corporation, Syracuse, N. Y., has been elected president of that company, succeeding the late EUGENE D. STOCKER.

DAVID C. PARK has been made president and treasurer of Smith & Caffrey, Inc., Syracuse, N. Y., structural steel fabricator, GEORGE G. HEIDLAUF, vice-president, and FRANK B. FLOYD, secretary. The men were directors of the company prior to the death this year of William Blackwood Smith and James A. Caffrey and all have been associated with the firm for many years. Mr. Park went to work as an office boy with Smith & Caffrey, Inc., 31 years ago, and Mr. Heidlauf began work in its foundry department 34 years ago, having been in charge of ornamental iron production for the last 20 years. Mr. Floyd, who is a structural engineer, went with the company 17 years ago and was previously associated with the McClintic-Marshall Co., Pottstown, Pa., and the American Bridge Co., Elmira, N. Y.

L. S. SHAFFER, recently general manager Byers Machine Co., Ravenna, Ohio, has become associated with the C. O. Bartlett & Snow Co., Cleveland, and will be in charge of the sale and development of a truck body, for the transportation of pre-mixed cement, which the company is now building. The sale of this body will be handled outside the regular Bartlett & Snow sales organization, the present plan being to distribute the product through dealers in contractors' equipment and motor truck manufacturers.

B. J. STEELMAN, for a number of years associated with the Wanner Malleable Castings Co., Hammond, Ind., has been made manager of the Kalamazoo, Mich., branch of the Wanner Malleable Iron Co., Decatur, Ill.

ROBERT P. KING, since 1916 works engineer at the Springfield, Mass., plant of the Westinghouse Electric & Mfg. Co., will become associated with the engineering department of the Dupont Rayon Co., Buffalo, N. Y., on Dec. 1. Mr. King is a member of the Cornell Society of Engineers, a director and chairman of the finance committee of the Engineering Society of Western Massachusetts and a past-president of the Springfield section of the American Institute of Electrical Engineers. He was graduated from Cornell University in 1912.

THEODORE C. WILSON, recently associated with E. Arthur Tutein, Inc., Boston, and previously with F. O. Henshaw, Boston, has been made pig

iron representative of the Donner Steel Co., Inc., Buffalo, in the New England territory.

H. S. DURANT, for a number of years manager of the cold-rolled strip and spring department, American Steel & Wire Co., Chicago, has resigned. He has been succeeded by A. J. HESS, who has been acting as assistant manager of that department.

T. E. DAVIS has been elected president of the Caldbeck Tool & Mfg. Co.,

Des Moines, Iowa, succeeding the late WENDELL H. CALDBECK. R. J. BENNETT has been named vice-president and general manager; EDITH CALDBECK, treasurer, and K. H. PETERSON, secretary.

JOHN A. MARR, for 10 years superintendent of the Nugent Steel Casting Co., Chicago, has been appointed works manager of the Chicago Steel Foundry Co., Kedzie Avenue and Thirty-seventh Street, Chicago.

associated with a sewing machine manufacturer, working up to sales manager of the New England territory. In 1892 he became affiliated with a shoe machinery maker, and was instrumental in the formation of the United Shoe Machinery Corporation. EDWARD P. BROWN, his son, is president of that company.

HARRY G. O'BRIEN, for 50 years an active figure in the iron and steel industry in the Pittsburgh district, died at the home of his daughter in Pittsburgh Nov. 14. He was born in that city 70 years ago, and as a boy went to work in the mills of Clark Sons & Co., which later became the Clark mills of the Carnegie Steel Co. He became superintendent of that plant but left that position to become manager of the Fort Pitt Malleable Iron Co., McKees Rocks, Pa. Later he was with the American Steel Co. and the Seaman-Sleeth Co. in sales capacities and then returned to operating work as superintendent of the mills of the Superior Steel Corporation. He joined the Trumbull Steel Co., Warren, Ohio, as superintendent of the strip mill when that company entered that branch of the business. Later he served as general manager of its special products division. For the past few months he had been in the sales department of the Pittsburgh Rolls Corporation.

WALTON HARVEY MEAGLEY, assistant sales manager of the Corbin Screw Co., New Britain, Conn., died suddenly, Nov. 11, at his home in Berlin, Conn. He was born at Binghamton, N. Y., 50 years ago, and had been associated with the New Britain company for more than 25 years.

SIDNEY JOHNSTON JENNINGS, vice-president United States Smelting, Refining & Mining Co., New York, and a past-president of the American Institute of Mining and Metallurgical Engineers, died on Nov. 17, at his home in New York. He was born at Hawsville, Ky., in 1863, and was graduated from Harvard University in 1885. After serving as a surveyor and engineer for the Anaconda Copper Co. in Montana, he went to South Africa, where he was active in a number of large mining projects. In 1907 he became associated with the United States company, serving it until the time of his death. As president of the Mining Engineers during the World War he took an active part in the working out of Government engineering projects and the manufacture of war supplies. In 1922-23 he served as president of the American Mining Congress. At the time of his death he was also president of the Hanover Bessemer Iron & Copper Co. and a director of Cia. de Real del Monte y Pachuca.

JOHN G. WAY, for 20 years general manager of the New Process Stove Co., Cleveland, and a director of the American Stove Co., died suddenly Nov. 18, as the result of a heart attack. He was 55 years of age and had been connected with the company 33 years.

OBITUARY

FREDERICK KENT COPELAND, president Sullivan Machinery Co., Chicago, whose sudden death at Claremont, N. H., on Nov. 10, was mentioned in THE IRON AGE last week, was stricken while visiting the company's plant in

F. K. COPELAND

the latter city. The founder in 1884 of the Diamond Prospecting Co., which at that time was engaged in contracting work in the West with diamond core drills made by the Sullivan Machine Co. at Claremont, he was instrumental in bringing the two companies together in 1892 and had served as president of the combined corporation since that time. During his long and active business and engineering career Mr. Copeland had built up a wide reputation for leadership and vision.

J. W. OLIVER, first vice-president and chairman of the executive committee of the Standard Sanitary Mfg. Co., Pittsburgh, died at his home in Sewickley Heights, Pa., Nov. 13. In 1903 he entered the employ of Ahrens & Ott Mfg. Co., Louisville, Ky., the plant of which is now the Louisville works of the Standard company. In 1911 he was made assistant manager and two years later manager of this plant. In 1918 he was advanced to general manager of the Ahrens & Ott division of the company and the following year was elected secretary-treasurer, with headquarters in Pittsburgh. He held that position until

early in 1924, when he was elected to the offices he held at the time of his death. Mr. Oliver was born in Elmira, Ill., 56 years ago, and was graduated from Iowa State College in 1895. He also completed a course in the Chicago College of Law and was admitted to the bar in the State of Illinois, but followed the legal profession for only a brief period. While a resident of Louisville Mr. Oliver served two terms as president of the Louisville Board of Trade. He was chairman of the Louisville War Industries Commission during the World War, and was a director of the Louisville Million Dollar Industrial Foundation.

CHARLES BRUCE WHITE, Chicago representative of the Cochrane Corporation, Philadelphia, manufacturer of steam power plant equipment, and vice-president and general manager of the Cochrane Engineering Co., Chicago, died at his home in the latter city on Oct. 16. He was born at Black Rock, Nova Scotia, in 1864, and received his early technical training at Boston, later becoming identified with the Thomson-Houston Electric Co., West Lynn, Mass. In this capacity he had charge of the building of some of the first electric railroads in the South. In 1898 he went to Chicago as chief electrician of the Calumet Street Railway Co. and later became associated in a sales capacity with the Western Electric Co. In 1900 he became St. Louis branch manager for the Sprague Electric Co., and the following year became identified with A. Sorge, Jr., & Co., then representatives in Chicago for the Harrison Safety Boiler Works, predecessor of the Cochrane Corporation. At the death of Mr. Sorge seven years ago he became vice-president and general manager of the Cochrane Engineering Co., which succeeded the Sorge company.

GEORGE W. BROWN, vice-president of the United Shoe Machinery Corporation, Boston, and for many years purchasing agent, died in Newton, Mass., on Nov. 16. He was born at Northfield, Vt., Aug. 30, 1841, and at the age of 18 became connected with a railroad company. Later he went into the grocery business and subsequently into hardware. He was then

Machinery Markets and News of the Works

Business Is Less Active

November and December Are Usually Months of Declining Orders, Says Machine Tool Association

ALTHOUGH machine tool business in November probably will not equal that of October, the volume has not dropped off materially and the prospects are promising for a better-than-average demand for tools during the remainder of the year. The monthly review by the National Machine Tool Builders' Association says "there is generally some seasonal recession in the last two months of each year," but the association does not expect any considerable falling off this year.

The index of machine tool orders indicates a larger business in October than in September. The October figure was 263.5, compared with 236.8 in September, 100 representing the average for 1922, 1923 and 1924.

With unfilled orders increasing on the books of machine tool builders, the supply of skilled labor becomes an important factor in the ability to make deliveries. Many shops are working overtime to meet the demand.

A favorable factor is that inquiries have not fallen off greatly. Some of the current inquiries are believed to be predicated on plans of industrial companies for next year. Purchases are frequently held down prior to the annual inventory period, but are resumed when this operation has been completed.

Chicago continues to report an active demand from manufacturers of tractors and other farm machinery. The J. I. Case Threshing Machine Co., Racine, Wis., has ordered \$50,000 worth of tools and the Allis-Chalmers Mfg. Co. has bought for its Springfield, Ill., tractor plant. The International Harvester Co. is buying against a list for its Fort Wayne, Ind., plant.

The Pratt & Whitney Co. has received orders for two lists of tools, one of 18 items and the other of 14.

Quotations are being received by the Fox Brothers International Corporation, New York, on a list of tools for shipment to Colombia.

two 13-in., four 16-in. and one 20-in. lathes, No. 2 jig boring machine, four die sinking machines, bench lathe, drill and milling machine. Sales reported during the week by Niles-Bement-Pond Co. included six high-speed tappers, No. 110 Ransom grinder, 24-in. Aurora drill, 4½-ft. Morris radial drill, 18-in. x 8-ft. Boye & Emmes lathe, 1½-in. Acme forging machine, extra heavy 42-in. rotary planer, four-spindle heavy mud ring drill and a No. 7 carbox boring machine.

Tide Water Oil Co., 11 Broadway, New York, has plans for addition to storage and distributing plant at Nyack, N. Y., to cost about \$35,000 with equipment.

Garford Motor Truck Co., Thirteenth Avenue and William Street, Long Island City, with main plant at Lima, Ohio, has plans for a two-story addition to local branch for service and repairs, 100 x 215 ft., to cost over \$100,000 with equipment. Frank S. Parker, 119 West Fifty-seventh Street, New York, is architect and engineer.

Department of Plant and Structures, Municipal Building, New York, has filed plans for two-story automobile service, repair and garage building for motor

trucks and cars, 110 x 150 ft., on West Farms Road, Bronx, to cost about \$110,000 with equipment.

Rizzuto Motor Co., Peekskill, N. Y., has awarded general contract to L. Keill Co., 22 Croton Avenue, Ossining, N. Y., for one-story service, repair and garage building, to cost about \$100,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., is architect and engineer.

Genfire Steel Co., Youngstown, Ohio, manufacturer of steel windows and other steel building products, has concluded merger with Fireproof Products Co., Inc., 536 East 133rd Street, New York, manufacturer and distributor of kindred specialties. Latter company will operate in future as New York factory branch of Genfire company, and will expand facilities.

Francis O. Blackwell, president Vlele. Blackwell & Buck, 49 Wall Street, New York, consulting engineers; William M. Flook, president American-Brown Boveri Electric Corporation, 420 Lexington Avenue; Thomas W. Streeter, chairman of board Simms Petroleum Co., 120 Broadway, and associates have organized American Cirrus Engines, Inc., to acquire manufacturing, sales and distributing rights of Cirrus aircraft engines in this country, now being produced abroad. New company plans establishment of plant for parts manufacture and assembling.

Independent Cork Co., Inc., Jefferson Crossing, Whippany, N. J., is considering rebuilding main plant unit, 60 x 200 ft., destroyed by fire Nov. 12.

Kolster Radio Corporation, 200 Mount Pleasant Avenue, Newark, has plans for new three-story addition, to cost over \$30,000 with equipment. Company has also acquired existing building near plant for establishment of a radio research and development works, to cost over \$25,000.

Newark Transformer Co., 17 Frelinghuysen Avenue, Newark, manufacturer of electrical transformers, parts, etc., has plans for an addition at 62 Sherman Avenue, to cost about \$35,000 with equipment. J. Kennedy, 44 Grove Street, Kearny, N. J., is architect.

F. J. Mullaney Iron Works, Inc., 574 Twelfth Street, West New York, N. J., is completing plans for new two-story plant, 200 x 200 ft., at North Bergen, N. J., to cost over \$75,000 with equipment. Charles G. Eichholz, Jr., 960 Bergenline Avenue, West New York, is architect.

George B. Steel Co., 370 Coit Street, Irvington, N. J., iron and steel products, has filed plans for one-story storage and distributing plant, 75 x 100 ft., to cost over \$20,000 with equipment.

Borough Council, Highlands, N. J., is asking bids until Nov. 26 for three complete pumping plants and sewage treating plant to cost \$300,000. Remington & Vosbury, 509 Cooper Street, Camden, N. J., are engineers.

Empire State Ice Co., Ninth Avenue

New York

NEW YORK, Nov. 20.—Machine-tool buying and new inquiry continue on a slightly smaller scale, but the railroads and some industrial users of machine tools are beginning to ask for estimating prices to be used in preparing budgets for next year. Among recent inquiries is a list of tools for export to Colombia, asked for by the Fox Brothers International Corporation, New York. The Curtiss Aeroplane & Motor Co., Buffalo, continues as a buyer of machine tools. The General Electric Co., Schenectady, N. Y., has closed on five machines in the past week.

Two sizable lists of machine tools have been placed recently with Pratt & Whitney Co. One list consisted of five 13-in., two 16-in. and one 20-in. engine lathes, bench lathe, No. 2 jig boring machine, 12-in. thread milling machine, two 6-in. and one 12-in. vertical shapers, hob and cutter grinder, two centering machines and a 14-in. vertical surface grinder. Another list consisted of a No. 12 profiler,

The Crane Market

SEVERAL overhead crane lists are still pending award and one was placed last week. New inquiry is fair, but not expected by most sellers to show much improvement before the end of the year. Moores & Dunford, engineers, New York, inquiring for a list of four 5-ton gantry cranes for the Waterfront Service Corporation, Brooklyn, N. Y., are expected to award the business within the next fortnight. Moderate interest is being shown in locomotive cranes by some

large users, but actual inquiry will probably be early next year.

Among recent purchases are.

United States War Department, Washington, 3-ton, 52-ft. span hand-power crane for shipment to Philippine Islands, from New Jersey Foundry & Machine Co.

Erie Railroad, New York, two 25-ton locomotive cranes from Industrial-Brown-hoist Corporation.

Hiler Engineering Co., Brooklyn, six

bucket handling cranes for Brooklyn Ash Removal Co., from a Western builder.

Following recent installations of Cleveland tramrail are reported by Leeds, Tozzer & Co., Inc., 75 West Street, New York, agents: Imperial Laundry Co., Newark, N. J., Elcon Co., Brooklyn, Consolidated Telegraph & Electrical Subway Co., New York, Canada Dry Ginger Ale Co., Hudson, Otis Elevator Co., Yonkers, American Car & Foundry Co., New York, and Palace Laundry Co., Washington.

and 219th Street, New York, is having plans drawn for an addition, to cost more than \$200,000 with equipment. Wigton-Abbott Corporation, 552 West Twenty-third Street, is engineer.

Petty & Wherry, Inc., 50 Church Street, New York, has been appointed distributor in metropolitan district for Buckwall Engineering Co., Brooklyn, manufacturer of Buckwall sprocket wheel.

American Brass Co., Waterbury, Conn., is rebuilding its electrical cable plant at Hastings-on-Hudson, N. Y., preparatory to production of high quality power cable. Insulating machinery and drying and impregnating apparatus will be installed. A testing laboratory for high tension cable work and examination of insulating oils, paper and cable sheath is also planned. Hastings plant was formerly operated by National Conduit & Cable Co. and its annual capacity of non-ferrous products is approximately 100,000,000 lb.

Although plant and general offices of De La Vergne Machine Co. have moved from New York to Philadelphia, company still maintains an office at 100 Broadway, New York.

American Electric Switch Corporation, Minerva, Ohio, has discontinued connection with Holland & Monaghan and now has direct factory representative in metropolitan district with office and warehouse at 430 East Fifty-third Street in charge of G. N. Lindstrom.

New England

BOSTON, Nov. 19.—Although sales in most cases involved only single items, in general, business again was good the past week. It included a variety of new as well as of used machinery for prompt delivery. Most of the buying is for increasing output or for reducing costs rather than for plant extensions. The Atlantic Works, East Boston, has bought wood-working and pipe shop equipment and will, it is expected, close on machine shop requirements this week.

New inquiries for single high-production tools are in fairly satisfactory volume and it is the belief in the local machine-tool trade that New England industries will require much equipment early next year.

Leading manufacturers are increasing production in an effort to keep up with bookings. General Electric Co., Pittsfield, now has 6500 workers on its payroll, an increase of 200 since Nov. 1, and of 600 within a year. Textile machinery makers are employing many more than three months ago. It is possible Draper

Corporation, Hopedale, Mass., will establish an assembling plant in the South early in 1929. Machine tool manufacturers, especially those in Worcester and Hartford, are adding night shifts as fast as skilled workmen are available. Makers of paper, sugar and rubber machinery, and of heaters and coal and gas ranges, are doing a better business than in several months, and the outlook for 1929 is encouraging.

Charles H. Lockwood, 171 Westminster Street, Providence, architect, has completed plans for a two-story addition, 40 x 49 ft., and 30 x 30 ft. for a jewelry manufacturer, owner's name withheld.

Milton Bradley Co., Springfield, Mass., has purchased from Nilco Lamp Works, Inc., Emporium, Pa., two four-story and two two-story manufacturing units on Wilbraham and Waltham Roads, Springfield, to manufacture toys.

Construction has been begun by Abertshaw Co., Boston, on new feldspar grinding plant for American Mineral Products Co., Inc., at Cold Village, town of Walpole, N. H. Plant will include three connected units, about 60 x 230 ft.

Contract has been let by Brown & Sharpe Mfg. Co., Providence, to Central Engineering & Construction Co., 20 Bond Street, Holyoke, Mass., for one-story foundry addition, to cost about \$45,000 with equipment. Jenks & Ballou, Grosvenor Building, are engineers.

Linstrom Sign Co., 115 First Street, Cambridge, Mass., has removed to a new location on Western Avenue, formerly occupied by Federal Iron Works, and will expand operations.

Berenson & Moses, Hartford, Conn., architects, have plans under way for three-story and basement automobile service, repair and garage building, 70 x 140 ft., to cost over \$100,000 with equipment.

Uncas Mfg. Co., 85 Sprague Street, Providence, manufacturer of jewelry, has filed plans for a two-story addition, to cost over \$40,000 with equipment.

Moore Drop Forge Co., Springfield, Mass., has awarded general contract to Adams & Ruston Construction Co., 1387 Main Street, for two-story addition, to cost more than \$45,000 with equipment.

Container Corporation of America, 111 West Washington Street, Chicago, has purchased plant and business of Corrugated Paper Mills Co., Natick, Mass., and will operate as branch mill. Company is also starting a new mill at Bridgeport, Conn.

Johnson Steel & Wire Co., Inc., Worcester, is erecting a one-story addition, 60 x 233 ft., which will more than double present capacity. New building will house additional equipment for drawing high-carbon steel wire, including tire, rope and music wires.

National Foundry & Machine Co.

Worcester, manufacturer of wire-drawing dies, is erecting a building, 40 x 80 ft., to take care of increasing business.

Precision Casting Co., Syracuse, N. Y., has acquired controlling interest in P. & R. Tool Co., Inc., 100 Lamartine Street, Worcester, Mass., and will move business to Cleveland, where a building is being erected for branch plant. P. & R. Co. builds Lester die-casting machine and dies. Nathan Lester, manager, will be connected with Cleveland plant.

M. C. Wright Co., Worcester, Mass., manufacturer of vacuum cleaners, has been reorganized under management of Dwight C. Daniels, who has resigned as production manager of machine division of Norton Co. Directors include F. Harold Daniels, president and general manager Riley Stoker Corporation. Officers are: President, Henry H. Wright; treasurer, E. Stanley Wright; secretary, Clifford L. Wright, and vice-president and assistant treasurer, Clayton M. Wright.

Philadelphia

PHILADELPHIA, Nov. 19.—Plans have been filed by International Harvester Co., 2905 North Sixteenth Street, Philadelphia, for two-story service, repair and sales building, 110 x 225 ft., for motor truck division, on site lately purchased, to cost \$140,000 with equipment. Headquarters are at Chicago.

Nathan and Harry Alterman, 3115 West Cumberland Street, Philadelphia, have organized Paramount Iron Works to establish a local plant for steel fabricating and iron working, including production of ornamental iron and bronze products, and plan to begin manufacture soon.

Department of City Transit, City Hall Annex, Philadelphia, C. E. Myers, director, will receive bids until Nov. 28 for car, track and electrical equipment, and for a battery charging unit, as per specifications on file.

Sun Oil Co., Finance Building, Philadelphia, has acquired 164 acres in Twin Oaks section, near its refinery at Marcus Hook, Pa., and is said to be planning construction of additional units to cost more than \$500,000.

Standard Wire & Iron Works Co., 1512 North Thirteenth Street, Philadelphia, has purchased two-story factory on Hancock Street, about 8,000 sq. ft. floor space, for expansion.

Ford Motor Co., Detroit, has plans for expansion at its assembling and distributing plant at Chester, Pa., including construction of new units and additional equipment. Works will be developed for a main branch for export business; loading and mechanical handling facilities will be provided at company docks; a

mill will be built for manufacture of wire-bound crates, box materials, etc. Project is reported to cost more than \$500,000.

Central Airport, Inc., care of C. Townsend Ludington, president Ludington Philadelphia Flying Service, Inc., Island Road and Tinicum Avenue, Philadelphia, recently organized by Mr. Ludington and associates, has engaged Black & Bigelow, Inc., 551 Fifth Avenue, New York, aero engineer, to prepare plans for air port at Camden, N. J., with shops and other units, to cost more than \$1,000,000 with equipment.

Automotive Rim & Stamping Co., Williamsport, Pa., recently organized by Edwin Wilkinson, 769 West Fourth Street, and associates, with capital of \$100,000, plans early operation of local metal stamping plant and machine shop. George E. Sands, 520 Pine Street, is also interested in company.

Barnard Tractor & Equipment Co., Harrisburg, Pa., has been organized by W. F. Barnard, Camp Hill, Pa., and associates as eastern factory branch and distributing representative for Caterpillar Tractor Co., Peoria, Ill. Company has leased space in building of Oliver Chilled Plow Works, Fifteenth and Mayflower Streets. E. P. Townsend will be manager of new company.

Milwaukee

MILWAUKEE, Nov. 19.—The machine-tool market is somewhat quieter. A good volume of business, however, continues to develop, sources of orders covering virtually all metal-working lines. Automotive industries, while still in the market, appear to have satisfied their present requirements, many awaiting deliveries before placing new specifications. Local output of tools continues at a high rate, with numerous shops still far behind on deliveries.

Ladish Drop Forge Co., Packard Avenue, Cudahy, Wis., is enlarging its plant for increase in capacity of drop and steam hammer products. Contracts have been placed for a new steel storage building and an extension of steam generating house. Present steel storage area is being converted into shop space. Work is under direction of Battey & Kipp, Inc., consulting engineer, 231 South LaSalle Street, Chicago.

Allis-Chalmers Mfg. Co., Milwaukee, is closing bids for a one-story shop addition, 200 x 600 ft., to its tractor division at main works in West Allis. Plans also are being completed for additions to Monarch tractor division works at Springfield, Ill.

Kwik-Mix Concrete Mixer Co., Port Washington, Wis., manufacturer of small-batch devices, contemplates erection of a new office and warehouse and conversion of space now used for these purposes into manufacturing area.

Rundle Mfg. Co., 1025 Cleveland Avenue, Milwaukee, manufacturer of enameled sanitary ware, has engaged Charles A. Cahill & Sons, consulting engineers, 214 Mason Street, local, to design alterations in its millroom, new equipment to include a rotary drier, one smelter, air preheater, etc.

Zenith Mfg. Co., Racine, Wis., manufacturer of super-power cylinder replacement heads for light cars and other automotive accessories, has purchased plant of Vogue Auto Painting Co. at 326

Thirty-seventh Street, in North Milwaukee, and will not erect a new plant as previously reported. Present shop, 40 x 60 ft., will be enlarged to 60 x 100 ft.

Lakeside Railway Signal Co., Freeport, Ill., has purchased site at Beloit, Wis., and will make an investment of approximately \$200,000 in a one-story shop, 60 x 300 ft., with considerable new equipment. Work is to begin Jan. 1. J. H. Shunk is president.

Wesley Steel Treating Co., 651 South Pierce Street, Milwaukee, engaged in commercial steel treating, has opened branch office at 308 South Fifth Street, Racine, Wis., with J. G. Barr as representative.

South Atlantic

BALTIMORE, Nov. 19.—Bids will soon be asked by Edward Katzinger Co., 1949 North Cicero Avenue, Chicago, manufacturer of bakers' machinery and tools, for two-story plant at Baltimore, to cost more than \$250,000 with equipment. Lockwood, Greene & Co., 400 North Michigan Avenue, Chicago, are architects and engineers.

American Oil Co., American Building, Baltimore, has awarded general contract to Consolidated Engineering Co., 20 East Franklin Street, for three-story addition to plant in Curtis Bay district, for storage and distribution, to cost \$100,000 with equipment.

Western Electric Co., 195 Broadway, New York, is said to have engaged H. K. Ferguson Co., Cleveland, to prepare plans for initial units of new plant in River View Park section, Baltimore, to cost more than \$5,000,000.

Tudor Ice & Cold Storage Co., Danville, Va., plans new six-story ice-manufacturing and cold storage plant, 120 x 120 ft., to cost over \$115,000 with machinery.

Hydro-Electric Corporation, care of M. E. Marcus, Mutual Building, Richmond, Va., president, is completing plans for hydroelectric generating plant on James River, near Snowden, Va., with initial capacity of 10,000 hp., to cost over \$200,000 with transmission system.

E. R. Taylor Motor Co., LaGrange, Ga., has plans for one-story and basement automobile service, repair and garage building, 100 x 150 ft., to include machine and parts department. Lockwood & Pondstone, Forsyth Building, Atlanta, Ga., are architects.

Chesapeake Paperboard Co., Key Highway and Baltimore & Ohio Railroad, Baltimore, has awarded general contract to Fred Wright Co., 217 North Calvert Street, for two additions, 85 x 178 ft., and 86 x 116 ft., including extensions in machine department, to cost about \$100,000 with equipment.

Sears, Roebuck & Co., Arthington and Homan Avenues, Chicago, have acquired about 20 acres at Alexandria, Va., and are said to be planning new multi-story factory branch and distributing plant, to cost more than \$400,000 with equipment.

South Atlantic Ice Co., Savannah, Ga., recently organized to take over and expand South Atlantic Packing & Provision Co., has plans for three new ice-manufacturing plants in different parts of city, to cost more than \$200,000 with equipment.

John E. Lock & Sons, Lawrence, Mass., manufacturers of bobbins and other textile mill equipment, are arranging to lease

building at Charlotte, N. C., for new branch factory. It is purposed to build a new plant later.

Chicago

CHICAGO, Nov. 19.—In contrast with recent weeks, the machine-tool business is showing rather an uneven tendency. Sales bulk large but are not well distributed. Fresh inquiry continues in satisfactory volume.

J. I. Case Threshing Machine Co., Racine, Wis., has placed orders aggregating over \$30,000, and Allis-Chalmers Mfg. Co. has made purchases for its Springfield, Ill., tractor plant. The list issued for Fort Wayne, Ind., by International Harvester Co. is being closed. The Missouri Pacific has purchased a few items at St. Louis, otherwise railroads are showing little interest in the machine tool market. One of the most active sections is Milwaukee and surrounding territory. Demand for used tools is lighter than at the beginning of the month.

Roesch Enamel Range Co., Belleville, Ill., has purchased property, 100 x 150 ft., and will erect a one-story factory to cost \$40,000.

Pines Winterfront Co., Chicago, has purchased property, 425 x 447 ft., at Cicero and Division Streets, and contemplates erection of an automobile parts manufacturing plant.

Dryden Rubber Co., 1014-22 South Kil-dare Avenue, Chicago, has begun construction of an addition to mechanical rubber goods plant, 85 x 125 ft., to cost more than \$125,000 with equipment.

Nachman-Springfield Co., 2241 South Halsted Street, Chicago, manufacturer of springs, has purchased plants and businesses of National Wire Spring Co. and Marshall Spring Co., Chicago, and will consolidate. All units will be continued in service and expansion developed. Automobile spring manufacture will be concentrated in future at National and Marshall plants, while Nachman-Springfield factory will be used for manufacture of furniture, airplane springs, etc.

Sanitary District of Chicago, 910 South Michigan Avenue, T. J. Crowe, president, will receive bids until Dec. 13 for pumping machinery and auxiliary equipment for Racine Avenue sewage pumping plant, including three motor-driven, vertical shaft centrifugal pumping units, each with output of 300 cu. ft. per sec., and six similar units, capacity 600 cu. ft. per sec.

Russell Grader Mfg. Co., 2037 University Avenue, S. E., Minneapolis, Minn., manufacturer of road-building machinery, has taken bids on general contract for an addition, 75 x 330 ft., to cost about \$60,000 with equipment. Sund & Dunham, Essex Building, are architects.

Albertson & Co., 3100 Floyd Avenue, Sioux City, Iowa, manufacturers of valve tools and kindred products, have begun superstructure for a four-story and basement addition, 40 x 150 ft., to cost more than \$80,000 with equipment. K. E. Westerland, War Eagle Building, is architect.

Stark Co., Marshalltown, Iowa, manufacturer of iron castings, etc., has asked bids on general contract for one-story addition, to cost about \$40,000 with equipment. H. E. Reimer, Kibbey Building, is architect.

City Council, Evanston, Ill., is planning installation of municipal electric light and power plant, to cost more than \$50,000

with equipment. City engineer is in charge.

General Motors Truck Co., Detroit, has leased building to be erected at St. Paul, Minn., for new factory branch, service and repair departments, to cost \$100,000 with equipment. Buechner & Orth, Schubert Building, St. Paul, architects, will take bids on general contract this month.

Material Service Corporation, 111 West Washington Street, Chicago, operating crushed stone plants, sand and gravel properties, etc., has disposed of bond issue of \$1,000,000, a portion of proceeds to be used for expansion, including completion of new sand and gravel plant at Lockport, Ill.

American Coil Spring Co., 1455 West Thirty-seventh Street, Chicago, which is building a new plant at Muskegon, Mich., informs THE IRON AGE that Muskegon project is to be a branch plant and main plant will remain at Chicago.

Independent Pneumatic Tool Co., 600 West Jackson Boulevard, Chicago, manufacturer of Thor pneumatic, electric and contractors' tools, will shortly begin erection of an addition to its factory at Aurora, Ill., which will increase present capacity 36,000 sq. ft.

Gulf States

BIRMINGHAM, Nov. 19.—Plans are being arranged by W. D. Haden Co., American National Insurance Building, Galveston, Tex., for new one-story mill, 45 x 350 ft., at Houston, Tex., for production of lime products, using oyster shells as raw material, to cost over \$130,000 with machinery. W. A. Brunet, Houston, is construction engineer, in charge.

Lamson & Sessions Bolt Co., operated by Lamson & Sessions Co., 2188 Scranton Road, Cleveland, for production in Southern territory, has awarded contract to Tennessee Coal, Iron & Railroad Co., Birmingham, for structural steel framing for new plant on 8-acre tract recently secured at North Birmingham, adjoining mill of Birmingham Stove & Range Co. It will cost about \$400,000 with equipment, ultimate project to cost more than \$650,000.

A power house and machine shop will be built by Alabama Braid Co., Gadsden, Ala., in connection with new local textile mill, to cost about \$85,000. Sidney M. Edelstein, 55 West Forty-second Street, New York, and Union, S. C., is architect and engineer.

Morris Lewis, head of Lewis Grocery Co., Lexington, Miss., is at head of project to construct a cold storage plant at Durant, Miss., to cost about \$100,000 with machinery.

Westex Engineering Co., Aaraan, Tex., has arranged for a change of name to Westex Machine & Tool Co., and increase in capital. Expansion will be carried out.

Ohio Oil Co., Findlay, Ohio, is reported planning construction of oil refinery near Del Rio, Tex., to cost more than \$200,000 with machinery.

Atlantic Pipe Line Co., subsidiary of Atlantic Refining Co., 260 South Broad Street, Philadelphia, has begun construction of new pipe line from Midland to Port Arthur, Tex., to cost more than \$1,000,000 with booster stations and other operating facilities.

Alabama Power Co., Birmingham, is said to be planning construction of new steam-operated electric generating plant near Mobile, Ala., for service at new mill of International Paper Co., now in course

of building, to cost more than \$500,000 with equipment and transmission lines.

Florida Portland Cement Co., Tampa, Fla., with limestone quarries at Brooksville, contemplates an addition to double present output, to cost more than \$300,000 with kiln and auxiliary machinery.

In connection with extensions of line from Port Arthur to Grayburg, Bragg and vicinity, by way of Beaumont, Tex., Waco, Beaumont, Trinity & Sabine Railway Co., Trinity, Tex., is planning construction of new engine house and locomotive repair shops at Beaumont, to cost over \$100,000 with equipment. Company will issue \$3,000,000 in bonds and \$901,500 in stock, part of fund to be used for expansion.

Swift & Co., Union Stock Yards, Chicago, meat packers, have awarded general contract to Smallman Construction Co., 1109 South Fifth Avenue, Birmingham, for new three-story produce and packing plant at West Point, Miss., 75 x 127 ft., with cold storage and refrigerating department, and isolated steam power plant, 18 x 159 ft.

Cleveland

CLEVELAND, Nov. 19.—Business with machine-tool dealers is fair, but not quite up to last month. However, there has been no falling off in inquiry, which is very good. Tool-room equipment is more active than production machinery. The bulk of business is coming directly or indirectly from the automotive industry. A local manufacturer of turret lathes reports that its November sales have exceeded those during the corresponding period in October. This company has increased production to such an extent that it can make slightly better deliveries than a month ago.

Cleveland Planer Co. reports recent sales of open side planers to Hutto Engineering Co., Detroit; Federal Machine & Welder Co., Warren, Ohio; R. H. Frietag Machine Co., Akron, Ohio, and to a Cleveland steel plant.

Following recent acquisition of aircraft plant of Glenn L. Martin Co., Cleveland, by Great Lakes Aircraft Corporation, purchasing company has arranged for sale of 200,000 shares of stock, portion of proceeds to be used for property purchase and facilities for production of commercial airplanes, including those for mail, express and passenger service. Plant heretofore has been devoted to aircraft for military and naval use. William R. Wilson is president.

Chevrolet Motor Co., West Grand Boulevard, Detroit, has work under way on enlargements in plant at Toledo, Ohio, devoted primarily to production of transmissions and kindred parts, to cost more than \$100,000 with equipment.

Ducket Window Platform, Inc., Toledo, recently formed by Henry C. Ducket and Edward J. Burman, Toledo, to manufacture patented window equipment and affiliated building products, has opened office at 110 Michigan Street, and is considering early construction of local plant.

Falcon Motors Corporation, Elyria, Ohio, affiliated with Willys-Overland Co., Toledo, Ohio, has begun an expansion and improvement program. Considerable part of remodeled plant will be given over to manufacture of coupé bodies for Willys-Knight and Overland cars; another part will be used for light motor truck manufacture.

Hercules Motors Corporation, Canton, Ohio, manufacturer of gas and oil engines, parts, etc., has awarded general contract to A. F. Wendling Co., Massillon, Ohio, for one-story addition, 90 x 100 ft., to be used primarily for testing, to cost about \$85,000 with equipment.

Buffalo

BUFFALO, Nov. 19.—Buffalo, Rochester & Pittsburgh Railroad Co., Rochester, N. Y., is planning for new steel car repair shop, with initial equipment and facilities for annual maintenance of 10,000 cars. Sites are being considered at Lackawanna, N. Y., near shops on Rochester belt line, and in vicinity of Pittsburgh. Plant will cost about \$400,000 with equipment.

Sun Oil Co., Finance Building, Philadelphia, has awarded general contract to A. W. Hopeman & Sons, 569 Lyell Avenue, Rochester, N. Y., for rebuilding part of storage and distributing plant at Syracuse, N. Y., destroyed by fire recently.

Ellicottville Furniture Corporation, Randolph, N. Y., O. S. McLarney, president, will soon take bids on general contract for one-story plant at Ellicottville, to cost about \$45,000 with equipment.

Nicholson Universal Steamship Co., Coe Terminal Building, Detroit, is said to be planning new two-story terminal warehouse and distributing plant at Buffalo, with installation of mechanical handling equipment, estimated to cost \$1,000,000. A. P. Evans is company engineer.

Cunningham-Hall Aircraft Corporation, Rochester, N. Y., has been organized to manufacture airplanes and has leased space in factory of James Cunningham, Son & Co., 13 Canal Street, manufacturer of automobiles. Through arrangement with latter company complete facilities of factory will be available to Aircraft corporation.

St. Louis

ST. LOUIS, Nov. 19.—Plans are being considered by Wagner Electric Corporation, 6400 Plymouth Avenue, St. Louis, for one-story addition, 120 x 300 ft., to cost over \$125,000 with equipment.

Blackmore Mfg. Co., 2100 Cass Street, St. Louis, manufacturer of furniture, is planning new factory at De Soto, Mo., to cost about \$40,000 with equipment.

Common Council, McAlester, Okla., is planning establishment of municipal airport, including shops and other units. A fund of \$50,000 is being arranged.

United Power & Light Corporation, Abilene, Kan., is disposing of a bond issue of \$1,000,000, part of proceeds to be used for expansion, including transmission lines, power substations, etc.

Kansas Electric Power Co., Massachusetts Avenue, Lawrence, Kan., is said to be planning a new steam-operated electric power plant near Leavenworth, Kan., to cost more than \$100,000 with equipment.

Universal Car Loading & Distributing Co., Wyoming Street, Kansas City, Kan., is planning new one-story storage and distributing plant, 75 x 225 ft., to cost about \$90,000 with equipment. Latter will include a crane and other mechanical-handling apparatus.

Meginnis & Schaumberg, Federal Trust Building, Lincoln, Neb., architects, have

begun superstructure for a three-story automobile service, repair and garage building, 50 x 140 ft., to cost about \$90,000 with equipment.

Board of Education, Moberly, Mo., is said to be planning installation of manual training department in new two and three-story junior college to cost about \$300,000, for which plans will be drawn by Ludwig Abt, 114 North William Street, architect.

Pittsburgh

PITTSBURGH, Nov. 19.—In point of inquiry the machine-tool market is active, but the more common experience of dealers is that sales are not in proportion to the requests for bids. The Westinghouse Electric & Mfg. Co. has issued a special list which includes two lathes, a radial and a sensitive drill, a shaper and two milling machines. There is also an inquiry for six tools for the Duquesne works of the Carnegie Steel Co. Tools for a new machine shop for the A. M. Byers Co., at its new plant at Harmony, Pa., will be placed through H. A. Brassert, Chicago, who is the consulting engineer.

O. A. and J. C. L. Brown, Tidioute, Pa., have organized Penn Cutlery & Tool Co., with capital of \$15,000, and will operate local plant to manufacture cutlery and small tools. Charles F. Maitland, 1500 Fifth Street, N. E., Canton, Ohio, is also interested in new organization.

Parkersburg Corrugated Box Co., Depot Street, Parkersburg, W. Va., has awarded a general contract to Plate Construction Co., Jeannette Street, for one-story mill unit, 50 x 290 ft., to cost about \$100,000 with machinery.

Pittsburgh Foundry & Machine Co., foot of Thirty-sixth Street, Pittsburgh, is having plans drawn for one-story foundry addition, for which bids will soon be asked on general contract. A. M. Tapp, Jenkins Arcade, is architect.

Mott Core Drilling Co., R. & P. Building, Huntington, W. Va., has approved plans for a two-story machine shop, to be used in part for storage and distributing service, to cost about \$26,000 with equipment.

Cincinnati

CINCINNATI, Nov. 19.—Pure Oil Co., York and McLean Streets, Cincinnati, Moore Oil Refining Division, has plans for new storage and distributing plant, to cost more than \$350,000 with tanks and equipment. Present works will be removed to new location.

Board of Public Service, Columbus, Ohio, plans extensions and improvements in municipal electric light and power plant to cost about \$100,000, including installation of boilers, stokers and other equipment. A new turbine unit is contemplated later.

Texas Corporation, Texas Building, Houston, Tex., is said to be planning to rebuild part of oil refinery at Pryse, Ky., recently destroyed by fire.

Continental Lumber & Mfg. Co., Jeffersontown, Ky., M. B. Patton, president, is planning construction of one-story hardwood mill, 100 x 150 ft., for manufacture of automobile and carriage products, to cost more than \$75,000 with machinery. Company will soon purchase boring machine, band saw ripping ma-

chine, cross-cutting tools, cut-off saws, saw tables, and other equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until Nov. 26 for milling cutters, reamers, twist drills, countersinks, etc., circular 182.

Henry Vogt Machine Co., 1002 West Ormsby Avenue, Louisville, manufacturer of ice-making and refrigerating machinery, has awarded general contract to H. A. Doll Construction Co., Lexington Road, for one-story machine shop, to cost \$65,000 with equipment. D. X. Murphy & Brother, Louisville Trust Building, are architects.

Following recent acquisition of Mercury Electric Sign Co., 1717 Magazine Street, Louisville, by Rainbow Light, Inc., Long Island City, N. Y., manufacturer of electric tube luminous lighting units, purchasing company has begun remodeling factory at 432 East Broadway for local branch. Later it is proposed to build entirely new plant unit to cost more than \$200,000.

Detroit

DETROIT, Nov. 19.—Brown-McLaren Mfg. Co., 5853 West Fort Street, Detroit, manufacturer of screw machine products, adjustable reamers, etc., has purchased six acres at Melvindale, Mich., for new plant, initial unit to be one-story, totaling about 50,000 sq. ft. floor space, to cost over \$100,000 with equipment. Present works will be removed to new location and additional machinery provided for larger output. R. C. Brown is president.

Crane Co., 836 South Michigan Avenue, Chicago, has awarded general contract to Cooper-Little Co., 5057 Woodward Avenue, Detroit, for one-story factory branch and distributing plant at Detroit, with pipe and pipe-fitting department, to cost over \$50,000. H. J. Clarke is company architect.

Cardboard Cutting & Supply Co., 1571 Wellington Street, Detroit, has awarded general contract to Myles Standish, 8100 East Jefferson Street, for an addition to cost about \$40,000 with machinery.

Federal Mogul Corporation, 11031 Shoemaker Avenue, Detroit, manufacturer of metal bearings and kindred products for automotive service, has engaged Pollmar & Ropes, Hoffman Building, architects, to prepare plans for one-story addition, 120 x 175 ft., to cost close to \$70,000 with equipment.

Officials of Central Development Co., Chatham, Ont., headed by R. L. Pattinson and J. V. Howard, operating pipe line properties, have organized Muskegon Pipe Line Co., Muskegon, Mich., to construct a 10-mile pipe line to Muskegon and vicinity for natural gas supply. Line will be extended later. Project will cost more than \$100,000.

Hudson Motor Car Co., 12601 Jefferson Avenue, Detroit, has awarded general contract to Otto Misch Co., 159 East Columbia Street, for two-story addition, 80 x 350 ft., to cost more than \$125,000 with equipment.

Wolverine Screw Products Co., Detroit, has awarded general contract to W. J. C. Kaufmann, 10610 Shoemaker Street, for one-story plant unit to cost over \$35,000 with equipment.

Cadillac Machinery Co., 414 Fisher Building, Detroit, has been appointed agent in Detroit territory for Boye & Emmes Machine Tool Co., Cincinnati.

Indiana

INDIANAPOLIS, Nov. 19.—Indianapolis Drop Forging Co., 1300 Madison Avenue, Indianapolis, is said to be considering a one-story addition, to cost in excess of \$30,000 with equipment.

Northern Indiana Public Service Co., Hammond, Ind., has plans for new steam-operated electric generating plant at Michigan City, to cost about \$10,000,000 with transmission lines. Holabird & Root, 333 North Michigan Avenue, Chicago, are architects; Sargent & Lundy, 72 West Adams Street, Chicago, are engineers.

Following recent organization of National Equipment Co., Milwaukee, to take over and consolidate Koehring Co. and T. L. Smith Co., both with local plants for manufacture of concrete mixers, gasoline cranes, road machinery, etc., consolidated company has arranged for acquisition of Insley Mfg. Co., 801 North Olney Street, Indianapolis, manufacturer of contractors' machinery and equipment, and Parsons Co., Newton, Iowa, manufacturer of power trench excavators, etc., and will merge with organization, making total assets of about \$9,000,000. Present plants will be continued and expansion is under consideration. Phil A. Koehring is president of new company.

North American Car Corporation, North Judson, Ind., manufacturer of tank cars, etc., plans rebuilding of local plant destroyed by fire Nov. 12. Headquarters are at 327 South La Salle Street, Chicago.

Board of Waterworks, City Hall, Evansville, will receive bids until Nov. 26 for two steel tanks, each 100,000-gal. capacity, on steel towers.

Tri-State Engineering Co., Zanesville, Ohio, has removed shop to Fort Wayne, Ind., and changed name to Woodard Engineering Co.

Pacific Coast

SAN FRANCISCO, Nov. 15.—Contract has been let by Neilson Steel Aircraft Corporation, Second and Camelia Streets, Berkeley, Cal., to A. Kirby, 2315 Twenty-fourth Avenue, for first unit of new airplane manufacturing plant on 3-acre tract, to cost about \$35,000 with equipment. Other units will be built later, entire project to cost more than \$100,000. Thomas S. Neilson is head.

Board of Education, Pomona, Cal., has approved plans for one-story vocational shop, 50 x 160 ft., at new high school group, to cost \$300,000, for which bids are being asked on general contract until Dec. 11. T. C. Kistner & Co., Architects Building, Los Angeles, are architects.

Buttress Mfg. Co., 507 Shatto Place, Los Angeles, manufacturer of wallboard, has filed plans for two-story plant 117 x 165 ft., to cost about \$70,000 with equipment. Moran Co., 740 South Broadway, is architect.

William Harris and Frank J. Solt, San Bernardino, Cal., have organized company to manufacture airplanes, and have awarded contract for initial unit, 80 x 200 ft., to cost about \$40,000 with equipment. It will be used for parts and assembling. J. Paxton Perrine, Lincoln Building, Los Angeles, is architect.

Shell Oil Co., 200 Bush Street, San Francisco, is considering new storage and distributing plant at Oakland, Cal., to cost about \$300,000 with equipment. Engi-

neering department of company is in charge.

City Council, Santa Monica, Cal., has plans for municipal airport at Clover Field, including shops and other units, to cost about \$50,000 with equipment. City engineer is in charge.

Washington Pulp & Paper Corporation, Port Angeles, Wash., is planning construction of new one-story chipping mill for pulp wood supply and power plant at Neah Bay, to cost over \$85,000 with equipment.

Coast Union High School District, San Luis Obispo, Cal., has approved plans for one-story manual arts building at high school at Cambria. Symmes & Cullimore, Bakersfield, Cal., are architects.

Racor-Pacific Frog & Switch Co., recently organized with capital of \$1,000,000 by officials of Ramapo-Ajax Corporation, Hillburn, N. Y., as a subsidiary, has awarded general contract to Austin Co., at Seattle, for new plant at last noted city, to manufacture railroad frogs and switches, for Pacific Coast trade, to cost about \$250,000 with equipment.

Canada

TORONTO, Nov. 19—Although machine tool sales fell off slightly the past week, inquiries carried over from the first of this month and those now appearing indicate that November business will not fall much below the earlier months this year. Sales were confined to units of one or two, but several lists have recently appeared for a half-dozen tools. Dealers and builders look for a continuation of demand for tools for some time and indications are that this year will set a new high record for peace years.

Riley Engineering & Supply Co., 360 Dufferin Street, Toronto, manufacturer of condensers, coal pulverizers, oil filters, etc., will start work soon on a manufacturing plant and office building to cost \$75,000, in Fairbank District, York Township, Ont.

Hull Implement Co., formerly Mississippi Iron Works, Almonte, Ont., has purchased a site at Hull, Que., for erection of a plant. New tools and machinery will be required.

Former plant of Maritime Bridge Co., Ltd., New Glasgow, N. S., which ceased operations in 1917 after being partially destroyed by fire, has been purchased from liquidator by W. A. McNeil, one of original owners of property. New machinery and equipment will be required.

Grinnell Co. of Canada, Ltd., 2440 Dundas Street, West, Toronto, has acquired control of Ontario Malleable Iron Co., Ltd., Oshawa, Ont., for approximately \$1,000,000. The two plants will be operated separately, and Ontario Malleable company will retain its name. No extensions are contemplated at present. Russell Grinnell will be president of reorganized companies; C. G. Sherman, vice-president; L. W. Jones, treasurer, and E. W. Shaw secretary. Directors include W. L. Horn, F. W. Cowan and John Dyer.

Canadian Cannery Co., St. Isidore de Laprairie, Que., will call for tenders in December for erection of plant at St. Hyacinthe, Que., to cost \$100,000.

Regent Knitting Mills, Ltd., 4060 St. Lawrence Boulevard, Montreal, is considering construction of a power plant on

North River at St. Jerome, Que., to cost \$65,000.

Stuart Construction Co., Art Building, Sherbrooke, Que., has been awarded contract for one-story factory, 100 x 200 ft., for Bates Valve & Bag Co., Ltd., Cap de la Madeleine, Que., to cost \$50,000.

Exide Batteries of Canada, Ltd., 153 Dufferin Street, Toronto, will start work soon on erection of an addition to cost \$27,500.

Western Canada

Dominion Department of Public Works, Ottawa, Ont., has retained C. D. Howe & Co., engineers, Port Arthur, Ont., to prepare plans for a 1,000,000 bu. grain elevator at Fort Churchill, Man.

Winnipeg Electric Co., Winnipeg, will soon call for bids for construction of a \$250,000 power house, to be built on completion of railroad from Whitemouth, Man. This is part of \$15,000,000 power development at Seven Sisters Falls, Man.

Foreign

A COMPANY at Sao Paulo, Brazil, is completing plans for early construction of nitrogen fixation plant requiring large investment for machinery, and has awarded general contract to a local company. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Brazil No. 200891.

Itabira Iron Ore Co., Ltd., Rio de Janeiro, Brazil, has secured approval of Brazilian Government of contract and concession obtained from State of Minas Geraes, covering development of iron ore and manganese properties. Plans are under way for erection of plant, with distributing facilities for raw product.

State Railways, Bangkok, Siam, will receive bids until Jan. 15 for 300 low-side steel wagons, as per specifications on file.

New Trade Publications

Overhead Conveyors.—Cleveland Electric Tramrail, Wickliffe, Ohio. Four-page folder TR-602 is concerned with the ease of pushing heavy loads suspended from an overhead tramrail accurately lined up.

Steam Boilers.—Erie City Iron Works, Erie, Pa. Two booklets describing and illustrating respectively return tubular boilers and the "economic" boiler. Both are horizontal units set in brick or similar casings and fired externally. They may be used with stokers, pulverized coal or oil fuels. Dimensions for the different sizes are given in tabular form. Each pamphlet is of 16 pages.

Oil Engines.—Walter A. Zelnicker Supply Co., St. Louis. Bulletin 373 listing used and rebuilt oil engines now offered by company. List includes marine Diesel engines, oil engine generators and other miscellaneous products.

Meters.—Connersville Blower Co., Connersville, Ind. Bulletin 4D dealing with company's different types of meters. Various features are described in detail with illustrations and charts, and sections are devoted to P. V. T. T. recorders, tandem meters for measurement over wide range of capacity and demand meters recording maximum consumption at hourly or half-hourly intervals.

Henry Ford and associated interests in Ford Motor Co., Detroit, have organized a new European subsidiary to be known as Ford Motor Co., Ltd., capitalized at £7,000,000 (about \$32,800,000), with headquarters in London. New company will take over all Ford interests in Europe, including plants and distributing branches. Work will proceed on main plant at Dagenham, England, where site was secured several months ago. Property has been purchased on Regent Street, London, for display and distributing center, with service and repair facilities and executive offices. Company will expand branch factory at Cork, Ireland, for production of Fordson tractors. Plant at Manchester will be extended. Sir Percival Perry, who introduced first Ford car in England, will be chairman of board of new company.

Plans are under way for a consolidation of Dorman Long & Co., Ltd., known as Clarence Iron & Steel Works, Port Clarence, Durham England, capitalized at \$60,000,000, specializing in production of steel ship plates and kindred iron and steel products, and Bolckow, Vaughn & Co., Ltd., operating Grangetown Iron Works, Bessemer Iron Works and Clay Lane Iron Works, at South Bank, York, and Middlesbrough Iron Works, Middlesbrough, with capital of \$40,000,000. New company will consolidate certain plants and plans expansion in output.

Soviet Radio Trust of Soviet Russian Government, Petrograd, has awarded contract to Radio Corporation of America, Woolworth Building, New York, for radio equipment and apparatus to an amount of 1,200,000 rubles (about \$600,000). Broadcasting and receiving stations will be built at different points in Russia, and accessory apparatus, including power equipment, acquired. Amtorg Trading Corporation, 165 Broadway, New York, is official buying agency for Soviet Government.

Handling Equipment.—Steubing Cowan Co., Cincinnati. Pamphlet devoted to use of lift truck platform systems by railroad and other carriers. Numerous illustrations are provided to show handling of materials in storehouse and machine shops. Emphasis is placed on economies to be achieved by consolidating less-than-carload shipments of freight on skid platforms.

Centrifugal Pumps.—Dayton-Dowd Co., Quincy, Ill. Bulletin 267 describing types CS and CSLH double-suction, single-stage centrifugal pumps. Type CS is designed for medium and high head service, type CSLH for low head service, and large capacity pumps, also dealt with, are provided for use in water works, filtration plants and drainage and irrigation projects.

Concrete Products.—Celite Products Co., Los Angeles, Bulletin 340, illustrated, dealing with methods by which relative degree of workability of concrete mixes can be measured. Effects of workability on strength, uniformity, water resistance and appearance of finished concrete are also discussed.

Electric Motors.—Wagner Electric Corporation, 6400 Plymouth Avenue, St. Louis. Bulletin 157 describing large RA single-phase repulsion-induction motors. Complete construction details are provided by means of illustrations, charts and text.

THE IRON AGE

New York, November 29, 1928

ESTABLISHED 1855

VOL. 122, No. 22

Increased Flexibility in Steel House

Substitution of Steel for Wood Members Permits Architectural Freedom in Dwelling Construction

STANDARD methods of wood frame construction have been adapted to the building of steel frame dwellings by simply substituting steel members for corresponding wood units in a house now being completed at Mount Lebanon, Pa., a Pittsburgh suburb. The frame of the dwelling, which was fabricated and erected by the Steel Frame House Co., Pittsburgh, a subsidiary of the McClintic-Marshall Co., was planned to give architects full leeway in their design and to allow builders to construct the building in the manner to which they are accustomed with wood frames. At the same time the owner was allowed to choose the type of house he desired with practically any floor plan and architectural treatment and was given the advantages of fireproof, non-shrinkable and rigid construction.

The house was designed by Lyon & Taylor, New York architects, and is being built by the L. O. Maines Construction Co., Pittsburgh, under the general supervision of L. Brandt, Pittsburgh housing engineer.

Architectural Standardization Avoided

The steel frame in the Mount Lebanon house takes the place of ordinary wood framing in every detail from the sill to the rafters, including all interior partitions and the framing of all openings, dormers and windows. The foundation is identical with that used for a wood frame. The architects were able to carry out the owner's plan and space requirements and to design the architectural features with the same speed and facility to which they have been accustomed in designing masonry or wood frame houses. Heretofore attempts to adapt steel framing to domestic construction have been centered largely around the idea of standardized units and designs in order to achieve the necessary economy in fabrication. In this instance, dimensions which the architect required within a maximum difference of 2 in. were met by the Steel Frame House Co. system, and with

slight extra care exact dimensions can be satisfied to a fraction of an inch where special details make it necessary.

The complete frame for this house was fabricated at the mill and delivered at the job site ready to erect with the use of ordinary tools, a wrench taking the place of hammer and saw. No cutting and fitting, welding or riveting was required at the job and the frame was erected in a relatively short time, particularly in view of the fact that all partitions, doors, window frames and other structural members were completed at the same time. Other standard materials employed in fireproof construction were used in conjunction with the steel frame with no more difficulty and at no greater cost than when they are employed with solid masonry walls or a wood frame. Mechanics wholly unfamiliar with the new system of construction completed the house without preliminary training and with only the normal amount of supervision after the special methods which had been developed were once demonstrated by the supervising engineer.

Frame of Standard Steel Sections

The frame itself is built up of standard steel sections, employing light steel angles for studs, corner posts, lintels and around openings. The horizontal members, including sills, girts and plates, are built up of standard channels. The floor joists are light steel I-beams, Junior beams of the Jones & Laughlin Steel Corporation having been used in this instance, and the roof rafters are channels. With the exception of the floor joists, all of the members are perforated along the flanges with 7/16-in. holes on 2-in. centers. This perforation is the heart of the system, for it permits assembly within a maximum dimensional limitation of 2 in. in any direction.

In a house of this type, when the architect's plan is received at the mill, an engineer prepares a framing plan

(Above) The brick veneer is applied next to the steel reinforcing fabric over a heavy waterproof backing.

(Right) The completed steel frame ready for the exterior walls. (Below) The concrete floors are laid on heavy reinforcing steel fabric over a waterproof backing, without the use of forms

and bill of materials in the ordinary manner. All of the principal structural units are taken from stock and the few special units are quickly fabricated from elements in stock that simply require cutting to length and the attachment of end clips or connections.

The degree to which these units have been developed is responsible for the simplicity with which the framing can be fabricated rapidly while meeting the special requirements of each individual building. The assembled structural units are then properly marked and delivered to the job, where they are put together in the normal sequence of operations employed for wood framing, merely substituting bolts for nails. This system, it is emphasized, reduces the amount of labor required for fabrication by substituting machine methods, permits carrying standard structural units in stock, gives the architect full freedom in design and enables the builder to follow erection methods that have already become familiar to him through the use of wood framing.

As the frame of a dwelling represents only 10 to 20 per cent of the cost of the completed house, importance is attached to the methods of employing standard building materials in conjunction with the structural steel framework. In this house the exterior walls are of brick veneer, of a new type of reinforced veneer construction. Over the exterior surface of the framing members a welded mesh reinforcing fabric, made by the National Steel Fabric Co., a subsidiary of the Pittsburgh Steel Co., with a heavy waterproof backing, is applied by means of clips, which are in turn attached to the studs and corner posts through the perforations in these members. The galvanized steel fabric is of the type used for stucco construction. When the stucco is applied, the waterproof backing is pressed away from the reinforcing wires, which become embedded in the stucco and serve in the same way as steel in ordinary concrete structures.

Outside of this fabric a 4-in. brick veneer facing is

laid and the cement mortar is run down in back of the brick against the reinforcing fabric with which it forms a bond. The waterproof backing protects the interior of the structure from dampness and is counted on to add an insulating membrane. For additional security, wire wall ties are embedded in the horizontal joints of the brick work and clipped to the reinforcing wires of the fabric. The roof deck consists of wood purlins bolted to the rafters, which in turn carry a plank roof deck and a slate roof.

The floors in the house are of concrete, which is laid without the use of forms. For this purpose a wire fabric with waterproof backing similar to that used on the walls, but of heavier weight, is stretched across the steel floor joists and clipped thereto with special wire clips of simple design. A 2-in. concrete slab is poured directly on the fabric, the waterproof backing of which acts as a form. Here again the weight of the concrete presses the backing away from the reinforcing wires, which thus become enmeshed in the slab. Wood sleepers are embedded in the floor in the areas where wood top floor is used, while in some rooms the slab itself is finished to a level surface to receive tile or a resilient flooring material.

The interior walls and ceilings are plastered on a third type of reinforcing fabric with waterproof backing which is slightly lighter in weight than that on the exterior walls. In this case the reinforcing wires are embedded in the plaster, forming a mechanical reinforcement for the plaster and serving to assure a sturdy type of wall.

Special provision is made in the steel frame for pipe chases, the smaller pipes being carried within the stud space and the larger ones, such as soil pipes, which cannot go in normal 4-in. partitions, being carried in special enclosures in the manner ordinarily employed in wood frame construction. Electric conduits, either of the pipe or flexible armor type, are carried through the walls in the usual manner and may run between the floor slab and the ceiling beneath as required. Before plastering is started ordinary wood grounds are attached to the steel frame to receive picture moldings, baseboards, door and window trim and other finishing details.

Fireproof Features Emphasized

The resulting house may be rightfully called a fireproof home, for its floors, walls and roof are of incombustible materials and, with the exception of decorative trim and occasional wood floor surfaces, no wood is employed at

any point in the construction. Even this use of wood can be eliminated by employing hollow metal or Kalamein doors and trim, a concrete or other fireproof roof deck and various types of incombustible finished flooring materials. While the "exposed" steel and specially light steel members in the frame would lose their strength under high temperatures, all of the members in this construction are inclosed behind surfaces of reinforced plaster or masonry. A plaster wall on metal lath or this new type of reinforcing fabric is considered an effective fire retardant.

Plaster Cracks Will Be Avoided

This type of rigid steel construction, it is held, will help to eliminate the cracking of plaster due to vibration, wind stresses and other strains. As steel expands and contracts so little under temperature changes, plaster cracks or other defects developing within the structure seem unlikely on this account. All of the steel received a heavy coating of non-corrosive paint besides being protected on both sides by a waterproof membrane and by masonry surfaces calculated to prevent moisture from having access to the framing members and shortening the life of the steel. The steel frame is advanced as vermin and lightning proof.

The builders of the Mount Lebanon house present an interesting argument in favor of steel frame house construction by stating that the fireproof, rigid and permanent character suggest the use of quality materials wherever practicable. When a steel frame house of this type is constructed the building material merchant sells the same products that he has been selling heretofore with the exception of rough lumber and wood lath and he also is likely to sell higher quality materials with a consequent larger volume of business and margin of profit.

Local Stocks of Steel Members

It is suggested that, while practical considerations at present will probably make it necessary for the manufacturers of the steel frame to handle their business direct or through agencies, the situation may ultimately change and the stock of steel frame units may be carried in local warehouses and by dealers. Thus there is nothing to disturb the materials dealer in the development of the steel frame house, and his cooperation is urgently needed if the wide market opened to steel in this type of construction is to be fully developed.

Alloyed Cast Iron Rolls

IN an article on rolls for rolling mills, F. C. Biggert, Jr., of the United Engineering & Foundry Co., Pittsburgh, in a periodical published for its employees, has the following to say:

Alloyed cast iron rolls are made both in chilled and grain qualities. The grain roll, so called because of its somewhat mottled or grained structure, corresponds to the ordinary sand roll.

In the chilled quality they may be made much harder than ordinary chilled rolls; they have a very high wear resistance and are considerably stronger. Particularly they are valuable on account of their resistance to spalling.

Spalling is the technical term for surface flaking, and is the cause of much trouble to the user of chilled rolls. An ordinary chilled roll is easily bruised. For instance, a sharp blow on the chilled surface with a hand hammer, while it may not cause a visible mark, will have bruised the metal so that a short period of rolling will cause a piece to drop out.

The new alloyed chilled rolls, for which, by the way, our company holds patents, will stand very severe usage without spalling, and in rolling some products, this quality has

practically meant the difference between failure and success.

The new alloyed grain rolls correspond, in a sense, to sand rolls, but are so hard and close grained that in many places they have been substituted for ordinary chilled rolls. Their wearing qualities are almost phenomenal, and combined with very good strength, give them a wide field of usefulness.

Still another type of roll recently developed is so hard that no tool has been able to turn it, and all shaping must be done by grinding. This type is now being used for cold rolling, where it has replaced hardened steel rolls, and to some extent, in hot rolling of flat material.

Chemical Solvent for Metal Cleaning

The chemical solvent trichlorethylene is being used for degreasing metal parts in some European shops. This substance has the chemical formula C_2HCl_3 , boils at 190 deg. Fahr., smells like chloroform, and will not burn or explode. Cleaning is done in three trays, one heated, the intermediate and final for rinsing. The heated tray has a water cooled cover, for condensing the rising vapors. Dirty liquid is regenerated in a simple distillation apparatus.

Self-Rule of Industry a Delusion

Sanction of Regulated Competition Leads to Extremes in Governmental Control—Better Banking Policy Offers Chief Hope of Balancing Consumption with Production

BY VIRGIL JORDAN*

WHEN the records are all in at the end of this year, I think it will be clear that 1928 will go down as the biggest year in our history from the point of view of industrial and trade activity.

Yet I do not believe there has been any year since the war, or even in our pre-war history, in which that over-worked word "prosperity" has had less real and definite meaning or has been more uncertain and questionable than it is today. I do not believe that there has been any time in our experience, outside extraordinary periods of war, of which it could be said that our situation has been marked by greater danger or about which more serious questions could be raised than that which we face now. When we have passed through it, successfully or unsuccessfully, I feel that 1928 will go down as a crucial year in our economic life, for in it we have come face to face with certain new, fundamental and unsolved problems of economic control and adjustment, and the future depends upon how clearly and generally we recognize these problems and how earnestly we attempt to deal with them in the next few years.

Economic Situation Out of Balance

The changes in production, distribution, consumption and finance that have created our "prosperity complex" have resulted in an extraordinarily unbalanced situation, marked by contradictory and inconsistent indications in respect to the trend of wages, prices, employment and profits. High wages in protected trades and occupations have not percolated down to the rank and file, or benefited workers in industries that have been left high and dry by the shifting tide of consumer wants. The high wage levels in some fields have availed the workers little in face of the declining opportunities for employment in these industries and have entailed wide shifts of the working population into new fields, the permanence of which is in turn uncertain.

Falling prices of raw commodities and basic materials in the face of continued high wages have perhaps benefited the lines in which these materials have been elaborated for the consumer's use, but the producer of these goods has had to face increasing pressure upon his profit margins, and there is little evidence that in most lines the consumer has had the benefit of lower prices. In fact, there is clear evidence that, while the prices of basic commodities have not shown signs of inflation, the general level of prices of the goods and services which constitute the general high standard of living in this country have steadily risen since the war and are nearly as high as during the period of war inflation. This in spite of intense competition and increased productive efficiency which have held prices in the basic industries at levels in some cases near the pre-war.

I need not repeat here the now familiar fact that in the last three years of prosperity the proportion of corpora-

tions reporting deficits in all lines of trade together was 41 per cent in 1925, 43 per cent in 1926 and, according to the statistics of income just released, rose to 45 per cent in 1927. The fact that among this continuing group of business concerns operating without profit or at a loss there are found the smaller concerns in industry and trade is admitted as a fact and is used to account for the large proportion of corporate business that is not conducted on a profitable basis.

Not only do these contrasts show themselves so strongly within each field of business enterprise, but more fundamental and serious still is the contrast which has been emphasized in recent years among the various major branches of our industrial structure. Everywhere it is the industries catering directly to the new wants and consumption habits of the population, providing the luxury goods and services that make for the high standard of living about which we talk, that have been most strongly stimulated and have enjoyed the greatest prosperity. This prosperity has been achieved in part at the expense of the older industries furnishing the basic materials and the fundamental services. The prices of these goods and services have tended to remain low or to fall throughout the world, while the goods and services that have been elaborated out of them and into which direct labor and distribution costs have been pyramided have tended to remain high or rise.

And among the nations as among the various industries the same contrasts have been emphasized in the years since the war.

We ought, I feel, to take stock earnestly of the situation and bring what knowledge we have to bear upon these questions. They all, in my opinion, resolve themselves into the question whether the relations that have heretofore existed between wages, prices and capital returns have or have not been permanently altered and whether or not we have entered into a period in which business is to be governed by a wholly new set of economic laws that will involve a fundamental reorganization of business in respect of competition and Government control and a fundamental change in financial structure and policies in respect of the control and distribution of credit.

Why Control of Production and Prices Is Urged

Of this central question there are two fundamentally opposing points of view which go to the root of economic thought about the present situation. One is that the maladjustment between wages, prices and capital returns, which has grown out of apparent overproduction and is the apparent cause of the difficulties and contrasts in many lines of industry and trade, must be met by a fundamental reorganization of the business structure. The anti-trust laws and Government policy toward business in general, it is declared, must be modified so as to permit a greater freedom of action in trade associations and combinations to control production, restrict competition and regulate prices.

*Chief economist National Industrial Conference Board, New York. From an address before the National Founders Association at New York, Nov. 21.

In this way it is anticipated that a sounder relationship can be established between wages and prices, from the point of view of capital returns, as a result of the increasing pressure upon employment that would flow from the closer integration and improved efficiency of industrial processes. Capital charges or normal profits would be made a fixed charge upon industry, through control of production and prices, instead of wages being a fixed charge and capital return a contingent charge, as is now the case. On this principle an effort would be made and the possibility created to make production follow demand instead of, as now, trying to raise demand to meet production. On this plan the equities of the small independent business enterprises would be in large part preserved, whereas now they are being steadily and rapidly wiped out through the relentless process of competition and overproduction.

With this line of thought I fundamentally disagree. I recognize that this process has taken and is taking place, rapidly here and abroad under the pressure of conditions that I have described, and I would admit there is a large and proper field for such reorganization of the business structure for improvement in conditions even without any revision of Governmental policy toward business. But I am convinced that in the long run it is fundamentally fallacious and dangerous to believe that the essential economic problem which we face is going to be solved in this way. That fundamental problem is the expansion and diffusion of consumer purchasing power at home and abroad in proportion to the expansion of our production and productive capacity. We cannot meet this problem in a sound economic way by restricting production or controlling prices in order to meet any fixed overhead charges necessary to preserve the existing capital equities in business enterprise, for this results inevitably in a more than proportionate restriction of consumer purchasing power.

The difficulty today is that production is more rapidly and fully financed than consumption, and you cannot meet this difficulty by any further financing or reorganization of production which increases the purchasing power of the investor's dollar and decreases that of the consumer. In the long run such an effort must defeat itself not only because a restriction of production involves a restriction of consumer purchasing power, but because the relatively high and protected returns to capital under such a system are bound to invite over-investment and increased competition, leading in turn to excessive production and falling prices under which the whole system will break down unless the Government or some outside authority steps in to control.

Regulation of Competition Leads to State Socialism

Such a principle is not only fallacious but dangerous, first because it is bound to stimulate increasing class conflict as between wage earners and investors, which we cannot assume will be materially mitigated by the kind of popular investment in corporate securities that has developed in recent years; and what is far more important it must lead inevitably to Government intervention much more far-reaching than that with which business has now to contend under the existing anti-trust laws. It seems to me obvious that business cannot ask of Government a free hand in the control of production and competition and the regulation of prices without finding itself forced to lean upon Govern-

mental authority to support and sanction the arrangements made and without thereby inviting Government to take an active part in the control of production and prices.

It is of ominous significance to me that in every instance in which, for special considerations, the Government in this or any other country has granted special privileges and exemptions under the anti-trust laws to particular fields of business activity, such as railroad, transportation, shipping, banking, agriculture and labor, it has found itself naturally compelled to set up special bureaucratic agencies of supervision and control in the form of Interstate Commerce Commission, Shipping Board, Federal Trade Commission and the Federal Reserve Board, part of whose functions it is to supervise and control the exercise of these privileges in the public interest. Nowhere can we hope to escape this quid pro quo if we enter into a bargain with Government in this matter. You perhaps do not realize that, in the McNary-Haugen and similar legislation that has been pressed almost to the point of success for the relief of the millions of farmers who find themselves in the same position as that of the small independent business enterprises everywhere, we have presented to us the logical extreme to which this line of policy leads. The fundamental danger that lies in this type of legislation is that, in order to preserve the equities of the six and one-half million individual farm enterprises by raising and controlling the prices of farm products to the domestic consumer, the Government is forced to set up an agency with vast machinery not only to care for the surplus but ultimately itself to control production by regulating the number of farm enterprises, the acreage planted and the output of individual farms—a task that is not only of inconceivable difficulty but means

essentially that the Government, to all intents and purposes, will have taken over the operation of a gigantic industry, and embarked upon a policy of state socialism on the largest scale.

Solution Lies in Financial Policy

In recognition of the dangers that lie in this direction there is a slowly growing realization that the solution of the problem balancing production and consumption can be most hopefully sought, not in any general reorganization and limitation of production, but in the field of financial and banking policy, which is the fundamental and universal factor underlying the whole economic situation because of its profound influence on the expansion, contraction and distribution of consumer purchasing power. In other words, from this point of view the evils of overproduction are essentially evils of under-consumption and they must be attacked not on the side of production so much as on the side of consumption. We are coming more clearly to realize that, contrary to the views of traditional economic theory, general over-production as well as over-production in special fields is not only possible but is inevitable so long as our banking credit and monetary policies do not permit us to utilize our credit resources to finance consumer purchasing power as rapidly as we finance our productive power.

We used to believe that production automatically finances consumption. The fact that consumption does not grow with production has been forced upon us in the last ten years of enormous increase in productive equipment

VIRGIL JORDAN

and efficiency, which have left almost every industry with a tremendous excess of capacity, and we now know that in the financing of production and distribution enormous reserves of credit purchasing power are tied up and utilized several times over to increase the output of goods and services before they flow back into the hands of consumers to enable them to purchase these goods and services. Our traditional banking theory has been that the only legitimate uses of credit are to draw out production which will automatically provide its own purchasing power, and we have failed to realize that the function of credit is not fully performed, and that any advances against future production cannot be extinguished or liquidated, until the entire process is completed in the ultimate consumer's use of the product or service.

Consumption Must Be Dovetailed with Production

It is clear that the entire circle of production and consumption upon which economic progress must proceed cannot be made complete and cannot revolve smoothly until we find some way of controlling and distributing consumer purchasing power domestically and internationally in relation to productive power, and this can be done only through our national and international banking systems, whose fundamental function is the accumulation and distribution of credit resources.

The difficulty is that the realization of these things is so recent and new and involves such a fundamental revision in our banking theory and practice that we are not as yet prepared for the changes in policy which are involved. What is more serious is the fact that our financial system in its present form has developed so rapidly and so recently that we do not know how to proceed, even if we were ready to do so, to control the power which resides in it for the purpose we have in view. We recognize the tremendous power which lies in the hands of our central banking systems in this and other countries; but the principles and technique of central bank operation have had too short a time to be far developed, and there is as yet no fundamental agreement concerning them.

Even though we were to make the stabilization of prices a definite policy at home and abroad we cannot be sure that we are able to or know how to make it effective. We feel that we can exercise more control over credit expansion when the initiative to such expansion comes from industry and trade, but except for the crude and uncertain device of instalment buying, we have found no way effectually to initiate wider use of credit, especially in the direction of increasing consumer purchasing power, when the rate of production is exceeding that of consumption.

Federal Reserve System Facing Crucial Test

In this country at the present time we are in the midst of a profound evolution in financial methods and policies the outcome of which is impossible to foresee. The striking contrast between financial activity reflected in the course of security prices and business activity reflected in commodity prices, volume of production and trade is but an extreme expression of the problem of credit control and distribution with which our banking system is faced. Though it is officially minimized and disclaimed, the so-called struggle between the Federal Reserve System and the stock market is a real and significant aspect of this problem of credit control.

The powers and policies of the Federal Reserve System to exercise a critical control over the distribution of credit power and consumer purchasing power are entering a crucial period of trial the full meaning of which is little realized. Though still limited in its scope and functions by traditional theories of banking policy which were embodied in its legal basis, the Reserve System has made enormous progress in its short history toward a realization of its constructive possibilities in the administration and control

of credit resources. It has developed probably the best measures of production, trade and consumption that have been devised; it has found means of keeping the closest watch upon the expansion of credit and the pulse of business opinion. More significant still is the fact that under the leadership of the late Benjamin Strong it has been able to function perhaps more effectively and creatively in the international distribution of credit than in its domestic control, and laid the foundations for international cooperation among the central banks of the world, which is an indispensable factor in preserving economic stability and promoting economic development at home and abroad.

But because of the limitations and deficiencies in its structure and authority it has so far been unable to exercise that control over the distribution of purchasing power internally which is fundamentally necessary for balanced economic development in this country. The initiative in the expansion of credit and in the utilization of individual and corporate savings has been taken out of its hands, and an enormous expansion of productive capacity has been financed out of bank credit far in excess of savings, without regard to the proportionate expansion of consumer purchasing power that is necessary to sustain this enormous superstructure of productive investment of bank credit. The consequence is that commodity prices have remained relatively low while the prices or values of capital equities have been inflated far beyond the limit of possible earnings on the basis of existing consumer purchasing power.

What is more striking is that an enormous volume of direct consumer purchasing power in the hands of persons of small income is tied up in commitments for the speculative purchase of these capital equities, and thus is actually withdrawn from the market for consumers' goods. How the equilibrium between productive capacity and consumer purchasing power will be restored no one can say positively at this moment. The enormous investment of bank credit in capital expansion may have to be spent and written off without return or with much lower returns than the investors anticipated. Wages may have to undergo a further inflation without a corresponding inflation in commodity prices in order to bring the level of consumer purchasing power higher. The readjustment may have to come through a collapse in commodity prices far below their present levels, to stimulate consumption proportionate to the increased productive capacity.

Must Prevent Unwise Distribution of Credit

Under our present financial organization there is only one way by which additional consumer purchasing power can be called into existence by the use of credit in sufficient volume to help sustain our enormously increased productive investment. The Federal, State and local governments, through their expenditures for public improvements and public services, together constitute the largest factor in the control of consumer purchasing power. They are the only agencies that are able to draw upon credit resources in any considerable amount for purposes of direct consumption. It may therefore be necessary in the event of a general depression for the Governmental agencies in this country to embark upon tremendous projects of public improvement and construction in order to sustain the general consumer purchasing power sufficiently to utilize our industrial capacity. The dangers that lie in this direction I need not enlarge upon but it is a grave question whether even such an influence would be adequate and permanent enough to meet the requirements.

Our main problem for the future is to develop such banking policies and methods as may prevent undue utilization of our credit resources through speculation, for the expansion of our productive capacity and increase of our overhead capital charges to stabilize the general level of prices, and to keep consumer purchasing power in step with production.

Automatic Seamless Pipe Mill

Avoidance of Straight-Line Flow to Achieve
Flexibility—Two Piercers Used to
Avoid Punishing Steel

BY SIDNEY G. KOON*

TWO independent automatic seamless pipe mills have been placed in the Aliquippa plant of the Jones & Laughlin Steel Corporation, Pittsburgh. The first of these, which is capable of making pipe from 6½ to 14½-in. outside diameter, has been in operation for some time. The second mill was more recently completed, and is now in operation. This mill makes pipe from 2½ to 6½ in. outside diameter.

There are six hot working machines in the larger mill and there are five in the smaller, besides two reducing mills. The six include a piercer, an expander, a plug mill, two reelers and a sizing machine. These are not set in a straight or continuous line, but are staggered, with short transfer tables between them, which gives a certain flexibility not possessed by a straight-line flow.

After leaving the sizing machine the pipe traverses a set of cooling-racks, which again, for purposes of convenience, do not form a straight line, but are in two sections with transfer between them. When sufficiently cooled the pipe goes through a straightening machine, and then is delivered to the finishing department, where it is cut off to length, has the ends chamfered and threaded, receives a hydrostatic test and is passed into the shipping sheds.

Inspection is exceedingly rigid, beginning with the blooms in the bloom yard. These are heavy, ranging from 8 x 8 to 14 x 14 in. in section and about 10 ft. long. All blooms are pickled in open-air pickling tanks, then chipped

and carefully inspected after the chipping is done, before going to the heating furnaces serving the round mill.

Passing through either of two continuous furnaces, which they enter endwise at one end and leave endwise at the other end, the blooms are rolled on two-high sets of rolls in two stands, served on both sides by traveling tables. The rounds thus produced form the raw material for the tube mill. Before shipment to that mill, however, they are cut to length by hot-saws and one end of each piece is given a deep center-punch mark in a machine which utilizes both pneumatic and hydraulic pressure, the one for striking the blow, while the other holds the piece in position.

Rounds Are Charged Hot

While still at a bright red heat—a temperature of about 1700 deg. Fahr.—these rounds are transported by standard-gage special railroad car and locomotive to the charging side of the tube mill furnaces. Here they are picked from the car, eight or ten at a lift, by a fork suspended from an overhead traveling crane and are deposited upon the charging skids of one or the other of the two furnaces. As so placed, each blank has its punched end in position (at left in plan of mill) for meeting the centering point on the piercing mill.

It is said that the two furnaces serving the tube mill are the longest continuous furnaces of that type in any plant. They use producer gas for fuel, with occasional by-product gas when it happens to be available. The rounds roll by gravity on the furnace bottom until, on reaching the

***T**HIRTY-IN. Round Mills of Two
Stands, with Traveling Table Showing
at Left. Large blooms are here re-
duced to sizes for making seamless pipe*

exit, they are thoroughly soaked with heat and are at the proper rolling temperature. The fact that they roll on the furnace bottom and do not slide is an advantage in uniformity of heating.

Each blank is pushed from its furnace lengthwise and then rolls sideways over a short section of transfer to enter the piercing machine. This consists of the Mannesmann type of crossed rolls with mandrel, the general operation of which has been described in THE IRON AGE at various times; in particular, see page 473 of Feb. 18, 1926, and page 681 of March 11, 1926. To take the thrust imposed upon the mandrel, there is a thrust bearing with 17 collars

From the expander another sideways movement places the blank in line for the plug mill, through which it passes in a manner similar to the foregoing, but under the action of a totally different type of roll. The relatively thin wall left by the expander is made still thinner in the plug mill, the operation of which is shown in another diagram. The rolls here have parallel axes and operate in the same manner as rolls in most forms of rolling. They leave the piece with a wall thickness approximately the same as that for the finished job. It differs from the finished pipe in several particulars, however. The interior and exterior are still somewhat rough, the pipe is a little under the finished size

LAYOUT of the Two Seamless Tube Mills and the Round Mill Which Supplies Them with Blanks. This article is concerned primarily with No. 2 mill. The arrows show flow of materials; C C, cut-off machines; T T, threading machines

arranged similarly to the propeller thrust bearing on a steamship. With adequate lubrication, this device performs its function without distress.

Operation of Piercing Machine

As the blank enters the piercing machine, the piercing point at the end of the mandrel bar is applied to the centered end of the round blank. As the outside surface of the round is gripped by the angular rolls, they start it rotating and at the same time advancing against the point on the mandrel. The action of the crossed rolls would open a hole through the center of the bar even were no mandrel present. The particular advantage of the mandrel with its point is that it guides the bar and thus makes the hole concentric as well as uniform in section. At the same time, of course, the displacement of metal results in elongating the bar.

Leaving the piercing machine, practically all of the blanks pass through the expander or second piercer. They reach this unit by a second sideways transfer and here receive treatment similar to that in the first piercer, but such that the piece comes out with a much thinner wall and a larger diameter. The diagram showing the successive sections of the pipe produced by the successive units of the mill illustrates this point clearly.

and it is not quite round. It receives two passes through the plug mill, being turned by hand 90 deg. after the first pass.

Stripping rolls are arranged at one side of the plug mill for running the pipe back after the pass has been made. The working rolls are moved away from each other through control of the operator and the stripping rolls then grip the piece and send it back. By this arrangement both sets of rolls are kept continually running without reversing direction, but they rotate in directions opposite to each other.

As the passage through the reelers is slower than that in the three mills already described, two units of this type are provided, to follow the succession of single units. Here again the oblique roll arrangement is used, but with rolls different in shape from the Mannesmann type. The mild expanding action here is of the planishing type, resulting in giving smooth surfaces to both the interior and the exterior.

While the operation in the reeling machines is similar to that of the piercing mills, it is much more gentle. The type and setting of the rolls are similar, but of smaller angle, while the plug over which the pipe passes is slightly larger than the inside diameter of the finished pipe. The rolls give the pipe a forward rotary motion and exert pressure, causing its walls to assume the exact final thickness.

PLUG Mill, for Further Opening Up of the Pierced Blank, and Thinning Its Walls, After It Leaves the Expander or Second Piercer. Two passes are required here, the piece being turned 90 deg. by hand after the first pass

Only one other operation is performed on the pipe while hot. This is to pass it through the sizing rolls, which reduce it from the slightly over-size at which it left the reelers to the exact diameter required for the finished pipe. There is no change in the wall thickness in this operation, while the smooth surfaces inside and outside are maintained. The sizing machine has five pairs of two-high rolls, the axes of each pair at 90 deg. from its predecessor and all at 45

deg. from the floor. Proper regulation of the speed ratios of the rolls in this unit makes the elongation of the pipe compensate exactly for the slight decrease in diameter which it undergoes in passing through.

In addition to making the various mill parts unusually sturdy, measures were taken in the design to guide the round, and later the pipe, closely in obtaining accurate results. The whipping of mandrel bars was thus practically

Successive Sections, from the Round Bar to a Completed Pipe

eliminated. All parts were made readily accessible and were so arranged that the vision from the operators' pulpits would be as unhampered as possible.

It was a departure to use two piercers—the second of which is called the expander—for this work. Many mills have only one piercer; this results in a much more severe action on the steel, and one which the Jones & Laughlin en-

Several operations, accompanied by exceptionally severe inspection, follow the cooling of the pipe after it has been made to size. All the pipe made goes through the straightener, which is of the conventional roller type and takes out any kinks or curves which may be in the pipe as it leaves the cooling racks. The straightening mechanism removes the scale from the surface and gives the pipe a high finish, on which any defects which may exist show up plainly.

Inspection of the pipe after straightening includes the use of a ring-gage for determining proper size and a close inspection of every foot, inside and out, for surface flaws. If flaws are found near the end, a ring may be chalked around there to indicate the point at which the pipe can be cut off to eliminate the area containing flaws. Sometimes a flaw in the center will permit cutting two short lengths of

PIERCER, in Right, Central Foreground, with the Two Heating Furnaces (1 and 2) in Rear. Angularity of the axes of Mannesmann rolls is indicated by shaft entering piercer

gineers believed would be injurious to it. Their experiments and experience indicate that a more nearly perfect pipe is produced by using a small round, piercing a small hole in it, and then expanding the piece through the second piercer, which is now the practice in that plant. For smaller size pipe, however, dimensional limitations of the product make it impossible, or at any rate inexpedient, to use more than one piercer. That accounts for the fact that only one is used in the mill on which the smaller sizes of pipe are produced.

Finishing the Pipe

TWO hours are required for the pipe to pass from the beginning of the cooling rack to the exit end. This rack is much longer than any other yet built. As the end of the two hours the pipe is practically cold. This procedure avoids internal strains in passing through the straightening process and at the same time insures a uniform grain structure throughout its entire mass. The forwarding chains on the cooling rack are fitted with small rollers like casters, which avoids marking the surface of the pipe, as might be done if it were slid on skids.

pipe, one taken from either side of the marked portion.

After passing through the cut-off machines, where the pipe has already been chamfered, it goes to the threaders and has threads cut on both ends. Hence, when it leaves the threaders, it is finished, but has to have a hydrostatic test.

Illustrating the Actions of the First Four Mills Operating on the Blanks and Showing the Mandrels and Plugs Used. Piercer, expander and reeler use "crossed" rolls

FROM the Plug Mill (Left) the Blanks Go to the Two Reelers—Alternately. These are seen just this side of the bridge. At right of plug mill is one of the numerous fans used to keep the men cool

A coupling is screwed on each end of the pipe, which then goes into the hydraulic tester and is subjected to a pre-determined water pressure. A gage on the movable head of the testing machine gives at once the length of the pipe, which is thereupon chalked on it. One of the final inspection acts is to compare the weight of each individual length of pipe with the theoretical weight for the length chalked upon it, as a final check upon the accuracy of manufacture.

By the time the pipe has passed the weighing bench it has had from 10 to 12 separate inspections and is as nearly perfect as pipe can be made. Even the action of the threading machines is not taken for granted, but inspection of the threaded ends is one of the things always carefully done. Each length of pipe as it is shipped or stocked has a

coupling screwed on one end. On the other end, to protect the threads, is a thread protector, which will be removed when the pipe, at its destination, is about to be put into use. The pipe as shipped is covered with a coating to protect its surface from rusting.

Couplings Made from Larger Pipe

Making and inspecting the couplings for the pipe are just as exacting as making the pipe. These couplings are produced from pipe of larger size than that to which they are to be fitted. Such pipe is cut off into proper lengths for couplings, the length being one of the items immediately inspected. Blanks thus formed are run through one of four automatic machines, each of which has two working heads.

SIZING Machine, of Five Pairs of Rolls Set Alternately 90 Deg. Apart and All at 45 Deg. from Floor. This set gives final size to the pipe and completes the hot operations on it

One head bores the taper on the inside of the coupling, while the other taps the surface thus prepared.

Each machine has four chucking stations, 90 deg. apart, for the work. The chucks may be rotated through 180 deg. so that after one end of a coupling is tapered and tapped it may be turned over and have the other end similarly treated. There is ample time while the tools in the heads are doing their work for the operator of the machine to remove a completed coupling from an idle station and insert a blank in its place. The tapering head is automatically withdrawn as soon as its cut has been completed. The tapping head is fitted with a tap which is automatically collapsed, and then withdrawn, when the threads have reached a predetermined point. Every coupling then is inspected by screwing it upon a standard thread-plug and rotating it to make sure that the cut and tapping are truly concentric.

Careful and complete record is kept of all heats of steel

fore the equipment was running with the precision which now characterizes it, but the unusual experience was had of the plant starting off without all the long development incident to cut-and-try methods, as usually is the case.

Stresses in Steel and Magnetic Properties

Iron and steel will sustain certain stationary loads for an indefinite period. If the same load is repeatedly removed and reapplied, however, failure of the loaded member may eventually occur. Failure because of such repeated stresses is termed a fatigue failure, and no certainty exists as to the reasons for its occurrence, according to the United States Bureau of Standards, which has recently made a brief study of the effects of such stresses on the magnetic properties of steel.

In the few samples studied, the magnetic changes ap-

FINISHING Department, with Cut-Off Machines, Threaders and Inspection Racks Filling a Large Area. From the straightener all pipe passes through various stages here to reach the shipping shed

entering the seamless mill. From this the chemical composition can be secured at any time. Physical tests are made from pieces milled out of sections of pipe. A certain proportion of the pipe shipped is subjected to this form of test, which provides enough work to keep one milling machine constantly busy.

All of the machinery is housed in a steel frame building of generous proportions, with a special form of sawtooth roof, giving north light and providing what is for a steel mill an unusually high quality of natural light. The glass surface of the sawtooth is more than 20 ft. from top to bottom in each bay, the bays being about 100 ft. wide. The building housing the No. 2 mill, which is the one here described, measures 600 ft. in length. This building was extended for an additional 725 ft. to accommodate the No. 3 unit and the auxiliary apparatus on the finishing end. There is no wall between the two units. In consequence, the building now measures 1325 ft. long.

Design of the entire plant, which was developed primarily in the Jones & Laughlin engineering department, was based on a long study of various types of equipment and arrangement which were inspected, both in the United States and in Germany.

So careful was this study made and so well were the lessons learned that, contrary to all expectation, the new unit was producing marketable pipe the first day it was operated. Naturally, there had to be many adjustments be-

peared to be due to the relief of stresses initially existing in the material. Such stresses probably have a detrimental effect on the fatigue resistance of the material in which they exist, and certain types of heat treatment may be resorted to in order to bring about their partial relief and a consequent improvement of the material. The magnetic data indicate that repeated stresses, too small to cause failure, may also effect a partial relief of the internal stresses. Some of the beneficial effects of repeated understressing may be due to such stress relief. This subject is discussed in Research Paper No. 26.

Flame Cutting Harmless to Structural Steel

In an effort to learn whether flame cutting is detrimental to the strength of structural steel, the American Bridge Co. sent some typical wind connections from a 44-story building to the Bureau of Standards for test. When pulled in tension these specimens, cut from 24-in. I-beams, broke through rivet holes, and when bent under impact the only cracks appearing were short ones originating in burrs around punched holes. A report in *Engineering News-Record*, Nov. 1, concludes that "there is no evidence from any of the tests that fabrication by flame-cutting injured the material or had any influence on the strength or reliability of the connections."

Melting Practice in the Foundry

Prime Requisites in Getting High-Grade Metal with Minimum Fuel Consumption—Electric Furnace as Cupola Auxiliary

BY HENRY M. LANE*

THE prime requisite of all foundry operation is properly melted metal. In gray iron practice two melting methods have been in general use. These are the cupola and the air furnace. For many years the air furnace was relied upon to give a superior product and much attention was paid to its proper operation and the control of the metal by means of test pieces. This method is still used quite extensively for producing relatively large masses of uniform iron to meet high test requirements and more will be said later about the process in connection with furnace design.

The cupola has been the main dependence of the foundry trade up to the present time. The fuel was originally semi-bituminous coal or anthracite and later coke came into general use.

There have been many improvements in cupola practice and a good cupola operator should have a knowledge of what chemical reactions take place in the cupola. The cupola is probably the most efficient furnace from a fuel standpoint that has been devised by man. The melting is done in direct contact with the fuel, which is usually coke. The descending charge is preheated by the ascending waste gases. The metal and the ash are all melted and run out in liquid form, the ash as a slag. In the case of short heats the slag is sometimes held in the cupola and allowed to flow out when the bottom is dropped at the end of the heat.

In cupola practice it is necessary to introduce the air as a high-pressure blast to overcome the natural resistance of the material in the descending charge. Originally some form of fan was used and the pressure which it could produce was limited and this limited the possible height of the cupola. With the introduction of the positive pressure blower, cupolas grew in height and there was a greater opportunity for preheating the descending charge and the saving of fuel.

The bed charge in a cupola serves simply as a stage to support the balance of the material during the melting operation. The bed, however, must be brought to melting temperature at the beginning of the heat so that it will not have a chilling effect on the metal. When metal is confined in the cupola and subsequently tapped into a ladle it is necessary to have storage capacity in the cupola and this metal must be stored within the coke bed and hence it is in an excellent position to take up sulphur or other impurities from the partially burnt coke of the bed.

The part of the bed below the tuyeres acts as a stage or support throughout the entire heat. The part between the tuyeres and the melting zone is the active melting ingredient of the charge and enough coke must be added to it on each charge to compensate for the coke burned in melting each charge. If recourse is had to a forehearth or receiving ladle the bed can be reduced to a minimum and a decided saving made in coke.

To understand coke consumption and coke savings some knowledge is necessary of the chemistry of combustion. When the air enters the tuyeres, if the blast is properly proportioned, the oxygen present will all be burned to carbon dioxide gas and this reaction will give off 14,500 B.t.u.'s per lb. of carbon burned. This also gives a maximum possible temperature which is around 3000 deg. Fahr., and which makes possible the rapid melting in the melting zone.

Unfortunately above the melting zone the descending carbon in the form of coke becomes red hot and a secondary reaction takes place in which the carbon dioxide takes more carbon and becomes carbon monoxide. When one pound of carbon is burned to carbon monoxide it only gives up 4450 B.t.u.'s or approximately 10,000 B.t.u.'s less than are given up when a perfect combustion takes place. As a consequence the formation of carbon monoxide above the melting zone locks up heat and carries it up through the charge in the form of carbon dioxide. This gas burns at the charge door with a blue flame much to the annoyance of those who must work on the charging platform. Many attempts have been made to reduce the proportion of carbon monoxide.

Nearly 30 years ago the writer and Thomas D. West ran some tests on this in connection with which we wet the coke and by this means we were able to reduce the percentage of carbon monoxide at the charging door very materially and to our surprise we saved coke, but when we came to figure the matter we found that we had simply prevented the waste of coke. The ascending heat was ample to expel the moisture and turn it into super-heated steam. This in turn preheated the descending charge quite as well as would have been done by the dry gases.

In the past it has been quite a common practice to figure that it required 30,000 cu. ft. of air to melt one ton of iron. If you are figuring maximum blower requirements, this is a safe figure to use, but it is a very wasteful figure and is only arrived at in very poor melting practice.

In figuring the amount of air necessary for a cupola it must be remembered that coke is not pure carbon but carries approximately 12 per cent ash and hence at any given melting ratio this must be taken into calculation in figuring the air requirements.

If the formation of carbon monoxide could be entirely avoided we would melt iron with about 22,000 cu. ft. of air per ton, but this figure is very difficult of attainment.

In order to have figures comparable, the bed should be excluded from the calculations and the amount of coke between charges considered as the actual melting ratio. In most fair foundry practice this is taken as a ratio of 1 lb. of coke to 10 lb. of iron.

Fuel Consumption Affected by Type of Metal

THE amount of fuel necessary is also affected by the type of metal being melted. Where steel is added to the charge there are certain chemical reactions going on as the steel descends through the cupola. Steel in the cupola be-

*Foundry engineer, Detroit. A paper read before the convention of the National Founders' Association, New York, Nov. 22

comes heated and undoubtedly takes up considerable carbon first from the carbon dioxide present and second from a solid carbon. This case-hardening action is increasing the carbon content of the steel and at the same time reducing its melting temperature. If the entire charge is made of steel it will pick up so much carbon in passing through the cupola that it is no longer truly steel but a low carbon cast iron. In order to accomplish these results it is necessary to maintain a very high temperature and the result is a lower melting ratio; that is more pounds of coke necessary to melt a ton of iron than are necessary when a soft grade of iron is being melted and the charge consists entirely of scrap and pig iron.

When cupola malleable is being made a still higher temperature is required and all of the carbon must be combined with the iron, and the result is a still lower melting ratio so far as pounds of iron per pound of coke melted are concerned.

With the old fashioned cupola the main savings which could be accomplished resulted from a careful selection of the proper kind of coke and the wetting of the coke.

Engineers have approached the saving problem from several other angles, all of which looked toward the conservation of heat. There was a Frenchman by the name of DeClercy who brought a cupola to this country 20 years ago in connection with which he had an auxiliary wind belt two or three feet below the charging door, from which he drew a certain proportion of the products of combustion and these he combined with additional air in the blower. His object was to dilute the carbon monoxide to such an extent that it would not burn or explode. The result was the preheating of the blast to around 200 deg. Fahr. and the return of a very small proportion of carbon monoxide to be burnt at the tuyeres. His cupolas did show very good savings, but it required a careful operation, and when the writer visited his foundry in Paris a few years ago this cupola was not in use at the home of its inventor.

The next important step was taken by Bradley Stoughton in his attempt to substitute oil for a portion of the fuel in melting. With this arrangement, oil was burned either in the auxiliary chamber, and the product of combustion introduced through the tuyeres with a small excess of oxygen, or was introduced directly into the tuyeres with oxygen sufficient to burn the oil plus a small amount of coke. Theoretically this arrangement was supposed to give a higher temperature in the melting zone and to reduce the amount of coke necessary. With coke fairly high priced and oil at a low price, as it was on the Pacific Coast some years ago, quite a saving can be shown with this style of melting, but the difficulty was to maintain the rate of oil flow and the excess oxygen on the one hand and the amount of coke added to the bed on the other so as to keep the bed at the proper height and avoid the oxidization of the iron. The nicety of the adjustment made it impossible to run this type of cupola with the same grade of labor which operated the ordinary coke-fired cupola, and this factor eliminated some of the plants, while the rising price of oil as compared with the coke eliminated others.

Powdered Coal as a Cupola Fuel

THE Whiting Corporation has recently been carrying on some interesting experiments in the use of powdered coal as a cupola fuel. In this case the coal is burned in auxiliary combustion chambers outside of the cupola and the products of combustion, together with a slight excess of air, are introduced through the tuyeres. As in the oil fired cupola the bed must be built up at a rate proportional to the excess of air introduced.

Both the oil fired cupola and the powdered coal cupola introduce one additional element into cupola practice and that is the presence of hydrogen in the combustible gases due to the presence of hydrocarbons in the auxiliary fuel used. This may not be wholly an unmixed blessing on the

one hand, the resulting components may break down to oxidize the descending charge, while on the other hand the burning of the hydrocarbons certainly will prevent the excess of CO gas in an all-carbon fuel.

Many engineers have looked for some way to utilize the waste heat, and recently there has been put on the market a hot-blast cupola which is turned out by the Griffin Engineering Co. and which was developed in connection with the plants of the Griffin Wheel Co. In this arrangement an auxiliary air belt, similar to the one in the DeClercy cupola, is placed a few feet below the charging door and a certain proportion of the products of combustion are extracted at this point, but unlike the DeClercy arrangement, no attempt is made to return these products of combustion to the cupola. On the contrary, a practice similar to that followed in blast furnaces is resorted to, and the material exhausted is burned with the addition of a small amount of oxygen and used to preheat the blast. The preheating arrangement is known as a stove. The products of combustion from the furnace pass up through pipes about which the incoming blast circulates. It is necessary to have an exhaust fan to take the products of combustion from the stove and blow them into the open.

This arrangement not only returns to the cupola a portion of the sensible heat present in the gases which have been exhausted, but also the heat made available by burning the carbon monoxide gas exhausted. With this arrangement the blast is heated to from 400 to 500 deg. Fahr. before it enters the cupola. This results in a more rapid combustion at the melting zone and in a higher temperature at the melting zone; also, if you attempt to maintain the same temperature, it is necessary to burn less coke to accomplish the results and hence there is a considerable saving in fuel as well as in the assurance of constant conditions in the melting operation.

There is no reason why the hot-blast system above outlined cannot be combined with the General Electric Co.'s control of the ingoing air and this should result in very efficient cupola practice.

Development of Special Furnaces

Many different types of special furnaces have been evolved to try to improve the quality of iron or to cheapen its melting.

In the air furnace group, attempts have been made to put a high chamber at the back end of the furnace, where a large amount of scrap was piled up, so that it could melt down as the heat progressed. In this connection a type of furnace known as the Pittsburgh furnace was developed and usually in charging a furnace of this kind small but heavy scrap was piled in toward the fire box and then the high part, or "kitchen" as it was called, was piled full of heavy scrap, pig and miscellaneous material. Melting always commenced near the bridge wall and progressed back toward the stack, so that the material in the high part of the furnace was melted down last by the heavy flame.

In like manner, air furnaces have been arranged to operate with oil, powdered coal or other fuel and provided with a stack or cupola at the back in which the real melting took place, the hearth being in use for superheating or for any refining.

In connection with the cupola, as has already been mentioned, a forehearth or receiving ladle is of advantage and in recent years this device has been used to reduce the sulphur by adding an alkali to the forehearth. This method is particularly useful where the cupola is used for melting metal for duplexing to electric furnace.

Use of Electric Furnaces in the Foundry

SO far as iron melting is concerned, electric furnaces divide themselves into two classes known as direct arc and indirect arc furnaces. In the direct arc two or more electrodes are usually arranged in a vertical position

and an arc is struck between them and the charge, the current passing through the charge.

In the indirect arc the electrodes are in a more or less horizontal position and the arc is struck directly between the electrodes without any contact with the charge. The indirect arc type of furnace lends itself particularly to a rocking operation, in connection with which the part of the lining heated by radiation from the arc is rocked under the molten bath, serving to superheat the bath.

The first operations in this country in making gray iron in the electric furnace used the direct arc type furnace and experimented with the melting down of an all-scrap charge. Some of the first experiments used a basic lined furnace and a second slag for reducing sulphur. In later operations an acid lining has been used and no attempt made to reduce sulphur in the electric furnace. Where scrap with the possible addition of pig iron is melted from cold metal in the electric furnace there will be no pick-up of sulphur and it is quite easy to control the amount of sulphur in the final castings. Where duplexing involving the melting of the iron in the cupola and the heating of it in the electric furnace is employed sulphur may be reduced in the forehearth of the cupola by treatment with a suitable alkali.

With the direct arc type of furnace the question of whether this process will pay depends upon several factors. On the Pacific Coast the relatively high price of coke, the low price of electric current and the low price of scrap make an electric furnace production of gray iron a very attractive proposition. In the East, at any point where electric current is particularly cheap it may be an attractive proposition.

Scrap Melting by Century Electric Co.

One exceedingly interesting case is that of the Century Electric Co., St. Louis. This company has a large percentage of very low-carbon steel scrap from the laminations of its motors and with this material as a base it has been making a synthetic gray iron. The process consists of having a baling press into which a certain amount of sheet metal was placed; then they put in a bag containing some cast iron borings, some carbon in the form of scrap from the carbon works and the necessary alloys of ferrosilicon and ferromanganese. They then introduce some more steel and press the entire mass into a bale or block which is charged into the electric furnace. With this is also charged the return scrap and sprues from the foundry and a small amount of coarse steel punchings. The entire mass is melted down into a high grade of gray iron. It is found that this metal is of essentially identical chemical composition with the cupola metal used formerly and is 20 to 25 per cent stronger. This additional strength gives a decided reduction in the breakage of delicate castings during machining operations and during shipment.

In the case of the Century Electric Co. the use of the scrap in the same building in which it originated saves transportation charges and the foundry is arranged on such a schedule that the furnace keeps off from the line during the peak load period. The result is a very nice melting arrangement, an improved product of iron and a reduced cost of castings of approximately \$30 a ton.

The company then decided to build a foundry to take care of its entire output, but here it immediately encountered the following factors: The new foundry was to be a continuous pouring unit with a conveyor system. If sufficient electric furnaces were put in to handle the entire output in a single molding shift the electric current charge would be unduly high if the molds were all made in one period, put on the floor and the furnace and shakeout gang worked throughout the 24 hr. there would be a big investment for building and poorer molding economy, which would more than offset electric furnace gain. In the old location the single electric furnace in use formed but a small part of the total load of the factory. In the new location the electric furnace would be a considerable portion and as a

consequence it was decided to use the cupola method for the bulk of the castings.

There are three methods in common use operating electric furnaces of the direct arc type; two of these methods have been in use for some time and the third has recently been put into commercial operation. In the first we have the direct melting of batches of cold metal either of approximately the composition required or the making of synthetic iron by the addition of carbon and alloys. In the second process we have the duplexing in which metal is melted in the cupola and superheated and refined in the electric furnace with or without the addition of alloys. In the third process a fairly large electric furnace is used, say of seven or eight tons capacity. In the morning a full batch is melted. Throughout the day ladles of say 1000 lb. each are taken from the furnace and a corresponding amount of cold material charged immediately. This material will be melted and incorporated in the bath by the time the next 1000 lb. is poured out. This continuous process is now in use and giving excellent results.

Electric Furnace Has Some Advantages Over Cupola

ELECTRIC furnace iron has a few advantages over cupola metal. The superheating of the metal makes possible its better deoxidization, the freeing of it from gases and the better combining of the carbon with the metal, which results in a product that weighs more per cubic inch than cupola cast iron, has a finer grain and will run 25 per cent or more above cupola metal in strength, even though the composition be the same. Also, this hot metal casts with less loss and particularly with fewer blowholes. As a consequence, the loss of castings in the machine shop is greatly reduced, machining qualities of the metal are also more uniform, and in most cases metal of a given composition seems to machine easier, which is probably due to the finely divided state of the carbon.

In the United States there are at present probably no locations east of the Rocky Mountains where electric furnace iron will not cost more than a corresponding cupola product, but one concern which machines its own castings has proved that, while the electric iron costs \$10 a ton more than cupola metal the final figures show that castings in the finished product cost \$21 per ton less for electric furnace product than for the cupola product. The difference is largely made up by the fact that with the electric furnace product there is so much less back charge for machining defective castings.

Electric current in the East will cost from a little less than 1c. per kw. hr. to approximately 1½c. with an average slightly over 1c. Roughly in the direct arc type furnace current can be taken at an average of \$6.83 per ton, electrodes \$1.20 per ton; refractories 50c.; labor \$1.04, or a total of \$9.57. To this must be added a 5 per cent melting loss and overhead.

In one case we can figure a charge made up of 1000 lb. of cast iron borings at \$11.50 a ton; 300 lb. stove plate at \$13 a ton; 200 lb. forging flashings at \$11.50 a ton; 500 lb. No. 1 gray iron scrap at \$19 a ton. Adding this to the above charge would give us a metal cost of \$21.35 per ton for batch melting. If the charge had been made up of 50 per cent pig iron and 50 per cent heavy gray iron scrap the price would have been \$28.47 a ton. Owing to the fact that in duplexing the electric furnace only takes about 100 kw. hr. per ton we have a much lower electric furnace cost in duplexing and counting refractories and labor we can figure on approximately \$2.47 a ton for duplexing. For continuous cold melting in one case the figure amounted to \$21.94 a ton.

Advantages of Indirect Arc Melting of Borings

THE indirect arc furnace is usually of a rocking type and is not so well suited for melting down heavy or chunky material as is the direct arc, but for melting cast

iron borings or fine material it has distinct advantages over the direct arc type and there are today quite a number of plants of this kind in operation. An interesting fact is that by taking the borings from a given grade of cupola iron and dead melting them in an electric furnace you will obtain a metal of far superior quality both from a wearing standpoint, from strength and from machinability. As already explained this is probably due to the better form of the carbon, to the superheating and also to the refining action.

Where the rocking type furnace is used, the charge generally consists of the back sprues and scrap together with borings. Even where borings are badly oxidized they can be cleaned up, the oxide reduced to metal, giving a good high grade product, but of course the reduction of oxide is made at the expense of carbon and to maintain the same percentage of carbon in the mix it is necessary to add carbon in some form. Generally for carbon additions in any electric furnace petroleum coke or some similar relatively pure carbon is better than high ash coke and in many cases old electrodes or scrap from the carbon works may be used for this purpose.

Planning to Utilize Borings

One of the prominent motor companies has run extensive experiments during the past year with this type of electric furnace and is now planning to put in an extensive plant for utilizing its borings. Where borings originate in a given plant, there is a distinct saving in converting them on the same property and turning them out as high-grade electric furnace castings and under suitable conditions this can be done in competition with cupola practice. This is due largely to the saving effected in handling and the improvement in the quality of the product in addition to the low market value of the borings.

If an electric furnace unit is to be worked to maximum output, advantage must be taken of at least a 20-hr. load, simply keeping off from the power lines during the peak period in the evening. This necessitates either molding 20 hr. or storing the molds. It is evident that in the next few years this process of reducing borings will be used very

extensively by some of the large motor car manufacturers.

The Enot Foundry at Wayne, Mich., recently installed several small Detroit electric furnaces and turned out a line of high-grade castings on purchased borings. From a metallurgical standpoint the operations were thoroughly successful, but from a handling standpoint they decided that 800-lb. furnaces would be much better than the 300-lb. furnaces installed and this new installation is now being put in.

High-Grade Castings Made from Purchased Borings

It is perfectly feasible to work with commercial borings purchased in the open market and to work into them a considerable portion of steel borings and turnings, but the metal composition must be watched carefully and necessary corrections made by means of alloys or other metal additions.

A number of firms have adopted a physical test to check the chemical test. In this connection a step bar having various thicknesses ranging from $\frac{1}{8}$ in. or less up to approximately $\frac{3}{4}$ in. can be cast in an ordinary sand mold, cooled and broken and the operator will be able to judge his silicon and carbon balance very closely and this will enable him to make corrections to the bath without waiting for an analysis.

One concern has recently purchased and is now installing one battery of transformers with two electric furnaces. The transformers are arranged so that one of them can be used singly or they can be used in parallel. When used singly they operate a 350-lb. brass melting furnace. When used together they operate a 1000-lb. iron melting furnace. Both these furnaces, of course, can take a considerable overload in capacity. The iron melting furnace will be used for supplying a small continuous molding unit and the brass melting furnace will be used for taking off one or two brass heats at noon, for pouring the work molded in the morning and for taking off one or two heats late in the afternoon for pouring the balance of the work. Such combined units as this will be of great advantage to concerns having a certain amount of high-grade iron that must show special physical properties.

Fatigue Failures of Large Engine Shafts

THE importance of designing for alternating stress so as to avoid "fatigue failure" of steel shafting and other parts is emphasized in a recently issued report by a British accident insurance company. Broken machinery examined during 1927 included the following:

A rolling mill engine shaft, 35 years old, broke after 520,000,000 revolutions. Nominal stress 4000 lb. per square in. and an occasional maximum of 8500 when the rolls would jam. Break was in crank web 8 in. by 14 in., where steel had been overheated and had coarse grained structure.

A gas engine crankshaft, 20 years old, broke after 220,000,000 revolutions, under a calculated stress of 13,000 lb. per sq. in.

Another gas engine crankshaft, 14 years old, broke after 380,000,000 revolutions. It failed at the fillet between web and shaft, where stress was 10,500 lb. per sq. in.

Still another failure in a similar shaft at the same position occurred after only 20,000,000 revolutions at a calculated stress of 15,970 lb. per sq. in.

Several of the fractures recorded were due to bad or indifferent quality, or else to material damaged by improper heat treatment. For instance, a cracked billet was used for one shaft forging. During the forging operation this crack

had opened, but the damage was patched by autogenous welding, which failed, however, to reach the bottom of the crack. Another shaft of an expensive alloy steel containing 0.43 per cent carbon, 1.43 per cent of chromium and 2.83 of nickel, had been damaged by tempering at too low a temperature, so that it was excessively hard and brittle. It failed, in fact, after ten weeks' service in a gas engine, running at 1000 r.p.m.

Several instances are noted of shafts running for considerable lengths of time in a cracked condition. In one, the crack had extended halfway through the shaft before final failure. With the higher speeds now in general use, cracks may spread seriously in relatively short spaces of time, while in the days when engine speeds ranged from 35 to 60 r.p.m., a cracked shaft has been known to run for years.

In chromium plating, the tanks containing the chromium may be ventilated by means of large exhaust fans, which are connected to umbrella-like hoods over the tanks. The fumes are drawn back into a special chamber where the vapor is condensed and run back into the tank.

W. H. Barr Resigns from Presidency

National Founders' Association Elects Col. Thomas S. Hammond,
of Harvey, Ill., to Succeed Him—Convention
Discusses Variety of Subjects

WILLIAM H. BARR, who for 15 years has served the National Founders' Association as its president and who in that time has been one of the acknowledged leaders in the open shop movement in American industry, declined to stand for reelection at the convention of the association at the Hotel Astor, New York, last week, and was succeeded by Col. Thomas S. Hammond, president Whiting Corporation, Harvey, Ill. In recognition of his long service to the association, the members unanimously voted to pay Mr. Barr a bonus of a year's salary.

The affairs of the association were reported to be

in good condition, financially and otherwise, although there has been some loss of membership, due primarily to the tranquility which has prevailed in employer-employee relationships in recent years.

Sessions of the two-day meeting on Nov. 21 and 22 were devoted to such commercial and technical subjects as foundry cost methods, industrial education, business prosperity and foundry melting practice. One of the outstanding features was a paper by Virgin Jordan, chief economist National Industrial Conference Board, Inc., on "Business Prosperity and the Basic Industries," which is reproduced on other pages.

Advantages of Uniform Cost Systems in Groups of Foundries

WHEN a foundry has educated its own organization to figure costs correctly it has done only half of its job, said John L. Carter, general manager Barlow Foundry, Inc., Newark, N. J., in a report on behalf of the association's foundry cost committee. The other half of the job is to educate its competitors.

"One of the conditions that frequently prevents us from getting a fair price for our product," said Mr. Carter, "is that some of our competitors do not know how to figure their costs, or do not figure them at all. Some time ago our Newark association sent out a blueprint to about 20 foundries and asked them to figure their cost on the job. The weight was given and the desired production was given. The estimates varied from 5c. to 15c. per lb. Similar tests have been made by other associations and the same ridiculous variation has been found. Can there be any doubt that some of these foundries did not know how to figure their costs?"

"If we assume that 50 per cent of the business you lose—or say only 25 per cent—is due to ignorance of cost on the part of some foundries, would it not be worth real money to you to teach those foundries how to figure their costs? And, if you and a number of other foundries in your district were all figuring costs by a uniform method, do you not think that a lot of ridiculous prices would be eliminated?"

"If some of your competitors are ignorant of accurate cost methods or sound economic principles, they can disorganize your market and make it impossible for you to earn a fair profit, no matter how efficient you are.

It is your plain duty to yourselves, your stockholders and your industry to try to educate your competitors to use scientific cost methods if any practicable way can be found to do this."

Group Plan for Figuring Costs a Success

Conceding that a uniform cost system on a national scale has not proved successful, although tried out by the American Foundrymen's Association, Mr. Carter said that uniform cost accounting in local groups has worked successfully, and he cited the experience of the Newark cost group to prove this. The Newark group plan has been working for five years; it employs its own cost accountant; the original group of six has grown to 12, and every member of it, Mr. Carter said, admits that it has improved conditions in the Newark district.

After the cost group had been working for two years a test problem was submitted to all members, and the bids on a specific job varied only $\frac{3}{4}$ c. per lb., instead of a spread of from 5c. to 15c., as was the case when a similar experiment was tried prior to the formation of this group.

"Our market has been stabilized," said Mr. Carter. "There is absolutely no price maintenance; we stop at cost. There is still competition among our members, but it is fair, honest, sound competition; it is based on efficiency. If one foundry is more efficient than another, gets more production or has a lower overhead, it will get a lower cost and can quote a lower price. But the guesswork—the wild, foolish

prices—are being gradually eliminated from the field.

Newark Plan Has Reduced Costs

"Another advantage of this local cost group plan has become of great importance. Periodically we get out comparative cost reports which show various items such as melting cost, cleaning cost, indirect labor, overhead percentages. No names are given, but you can compare your own figures with those of other foundries, and if you find your own costs are high on a particular item you know where to concentrate your efforts to bring this item in line with comparative costs of other foundries.

"You know the attitude of the ordinary foundry superintendent. He thinks he is the most efficient operating head in the country. He has all sorts of alibis. He says, 'My cleaning cost is down to rock bottom, and no one could get it down any lower.' But if you can show him that his costs on the comparative report are higher than the average, you can make some impression on him. And if you have a local cost accountant, as we have, who is in close touch with operating conditions in other plants, he will help to convince him. And when you convince him that he is high, he will go after that item of cost and find some way to reduce it.

Large Savings Effectuated

"A great many big savings by members of our group would not have been effected had we not had these comparative cost reports. In our own foundry we have saved about \$5,000 a year on cleaning cost alone. Another foundry found its bench jobbing division was showing a loss. Its di-

rect labor was high. By continued attention and replacing one or two molders, this loss was changed to a profit, a saving of about \$3,000. Another foundry found that its overhead on floor work was out of line. After six months' intensive work on this item, it was able to cut out 10 men, a saving of over \$12,000 per year. Every one of us has saved the cost of this work many times over.

"There are 25 or 30 of these local cost groups operating now in various parts of the country. They are a recent development—their number is growing. The establishment of more cost groups in other localities would greatly improve conditions in our industry. The main purpose of this committee is to promote the formation of such groups in as many foundry centers as possible. If you wish any advice or assistance in starting such a group we shall give it.

"If you wish to start a cost group, the first step is to have a talk with your best friend among the local

foundries. Sell him the idea and then call in three or four more and sell them the idea. Then jointly hire a cost man to install and operate your uniform system. You can either hire a man to give his full time to the work, as we do in Newark, or you may arrange with a consulting accountant to give part of his time to the job.

"You must, of course, agree on some system. We have no pet system to foist upon you. The important thing is not what system you use, but that all members of your group use the same system. If you operate a malleable or steel foundry, we recommend using the system sponsored by the Steel Founders' Society and the Malleable Iron Research Institute. The American Foundrymen's Association has also recommended these two systems. For gray iron foundries, there is no standard system as yet, but we hope to get a description of a system which has proved successful in some of these groups and have this available for your information. We hope

soon to get data on a system for non-ferrous foundries also.

Cooperative Action Will Solve Problems

"The trend of the times is away from individualism and toward cooperative action. The foundryman who insists on running his business with a total disregard of the interests of his industry is out of date. We have learned that we cannot solve all of our problems by ourselves. Some of them require joint action. In the field of employee relations, this became apparent years ago. The National Founders' Association has clearly demonstrated that only by united action can we hope to maintain satisfactory conditions in this field. This committee believes that the adoption of a uniform cost system by a group of foundries in each locality is the most effective and probably the most far-reaching step to improve conditions in each locality and in the foundry industry as a whole."

How Two Large Companies Handle Personnel Work

DISCUSSING foremen training and personnel work, L. A. Hartley, director industrial education National Founders' Association, related some of the high spots in two large plants. Much of his talk, which was illustrated by lantern slides, was based on methods used by the Ohio Brass Co., Mansfield, Ohio, which he pointed to as one of the best systems he has studied, although, he said, there are some others equally good.

The Frigidaire Corporation, Dayton, Ohio, has established six definite rules of conduct for all employees regardless of the nature of their duties. These rules, which affect thousands of workers, have received the test of time, and, in the opinion of Mr. Hartley, the aims of the management have been achieved in that the men become better on their jobs and their home life is happier. The six rules are as follows:

1. Follow instructions willingly.
2. Be clean and orderly.
3. Take good care of property and materials.
4. Work well from whistle to whistle.

5. Work every day you can and tell your foreman when you cannot.
6. Work well with others.

These are called "the six laws of good work." In this large organization every employee is expected to know them and continually to study their application. Group and individual instruction is organized with this objective.

Ohio Brass Co.'s Methods

The Ohio Brass Co. has applied these same rules a little differently, according to Mr. Hartley, having set forth the following seven questions which apply to every worker:

1. Does he do good work?
2. Is he dependable?
3. Is he careful?
4. Is he clean and orderly?
5. Is he punctual and industrious?
6. Does he follow instructions willingly?
7. Is he agreeable?

To stress the interest of the management in the home life of its employees, and also to stimulate the interest of the foremen in the outside activities of their men, the company

files answers to the following questions about each employee:

1. Is he single? Or married?
2. How many dependents?
3. Does he own his home?
4. Is he buying a home?
5. Has he group insurance?
6. Is he in a savings plan?
7. Has he ever made any suggestions for improvements?

Mr. Hartley said that the two plants mentioned have achieved remarkable savings in production, have noteworthy records in maintenance of equipment, their conservation of materials is unusual, their scrap or unusable product is exceedingly low, the plants are kept clean at little extra expenditure, orderliness is apparent, and accident records are very low. In addition, he said there was an unmistakable atmosphere of happiness.

These rules, he said, are the fundamental principles of industrial economy in these nationally known manufacturing institutions. Their intelligent application by and to all employees carries the interest in each other's affairs beyond the plant and does it without paternalism.

Conditions Today Call for New Type of Business Man

"THE New Forces in Business" was the subject discussed by Charles F. Abbott, executive director American Institute of Steel Construction, New York, who said that "the industry which grasps the full meaning of the new form of competition and adapts its policies to meet it will inevitably outstrip those who are unable to recognize the change which confronts them or who fail to place the proper valuation on public opinion as the controlling factor of industrial progress."

As in addresses which he has made to other conventions recently, Mr. Ab-

bott stressed "the sharp competitive struggle" going on today, and the need for more intelligent handling of the problems of distribution and of scientific marketing and selling. "This new day," he said, "calls for a new type of business man, whose ability to create new ideas, new policies and to assume leadership will be an essential qualification."

A modification of the Sherman anti-trust law, with intelligent interpretations, might relieve the situation which today confronts many businesses, said Mr. Abbott, but he added that the Sherman law is not alone

responsible for the new conditions, nor would its repeal remove the principal of present-day problems.

"It is becoming more and more apparent," he declared, "that production in important fields has outgrown the anti-trust laws of 40 years ago. Trade agreements which have for their purpose the conservation of a product for the best interests of the public or the saving of an industry would not necessarily come under the prohibition intended by the framers of the statute."

"Business men must learn how to regulate themselves if they wish to avoid state socialism. A manufac-

turer has as much right to legal protection as the consumer. He should be accorded as much protection from the vicious acts of his competitors as are consumers.

"Mergers, leading as they frequently do to monopolies, offer no solution of our industrial problem. Cooperation and coordination of effort do. Co-operative activity, aimed primarily at better merchandising methods, offers

the one assurance of prosperity under present conditions of industrial and business activity."

Dwelling on the importance of advertising as one means of solving the problems of marketing and distribution, Mr. Abbott said that "the steel industry is the only large and important industry that has failed to seek the benefits of a national advertising campaign to educate the public."

Inveighs Against Anti-Injunction Legislation

JAMES A. EMERY, counsel of the association, discussed the anti-injunction legislation now pending in Congress, known as the Shipstead bill, and another bill which would "substantially abolish the jurisdiction of the discount courts of the United States with respect to suits predicated on diversity of citizenship or cases arising under the Constitution, treaties or laws of the United States, thus leaving to such courts only their admiralty jurisdiction and that over copyrights, patents or suits to which the Government is a party."

Mr. Emery said that this latter

legislation would leave to the State courts all of that vast body of litigation involving the most serious questions of constitutional rights and also litigation between citizens of different States or between citizens and aliens, for which the Federal courts were primarily created.

"The very existence of a written Constitution," he said, "requires for its interpretation and enforcement a national judiciary, qualified by learning, temperament and character to make it effective in every part of the American nation."

John Alden Grimes, representing

the Internal Revenue Bureau, Treasury Department, sought the aid of the National Founders' Association in a program now being carried out by the Treasury Department to fix standard rates of depreciation on equipment and other physical property. The method of procedure followed by the department is to set up these rates on an equitable basis after a conference with an industry. One such agreement has been in force 10 years, he said, and no serious dispute has arisen under it. The need for such agreement on depreciation rates is the various methods employed by single units of the same industry, thereby confusing the Treasury Department in deciding what are proper charges and what are not.

Important technical papers were by Henry M. Lane, foundry engineer, Detroit, on "Melting Practice," and by H. V. Crawford, General Electric Co., on "Automatic Blast Gate Control for Cupolas." The paper by Mr. Lane will be found elsewhere in this issue. That by Mr. Crawford will be reviewed in a later issue of this publication.

Discussion of Open-Hearth Problems

Labor Saving Devices, Characteristics of Bottom-Making Material, Automatic Control of Drafts, Oil Burners, Regenerator Brick— Among Topics at Pittsburgh Meeting

LAST week two of the main subjects taken up at the Pittsburgh Meeting of the Open-Hearth Superintendents' Conference were covered in *THE IRON AGE*, (pages 1294 to 1298). The remaining general topic has to do with the operation of the furnaces, this being reserved for discussion at the third session of the conference. As with the previous sessions, there were no papers read at

this closing technical session of the meeting. Reliance was had, rather, on a free discussion from the floor of the several topics as they came up. The chairman called upon various members for expressions of opinion and, after one topic had been exhausted, went to the next one. In the following paragraphs is a digest of the discussion on operating factors.

Operation of Open-Hearth Furnaces

BOTTOM making and patching, combustion control, nozzles, stoppers and regenerator brick formed the topics for discussion at the third session. There were some progress reports on the use of various devices and a general interchange of opinion on matters affecting the day-by-day operating side of the furnace problem.

Use of Dolomite Machines

Something of a progress report on labor saving by the use of these machines was made by several men, who previously had reported installing such equipment. One man who had been running somewhat short of labor in the shop did not save any men with the machine, but it made the existing force much more readily available when the shop was crowded with bunched heats. He found that the machine cut down the elapsed period between tapping a heat and putting in the next charge by an average of 10 min.

Other men reported taking off one man for each two furnaces, taking off two or three men to the turn on shops with 10 or 11 furnaces, etc. Some time was reported saved between heats. In one case this was 20 min.; the time now occupied being 25 min. against 45 min. previously. It was the general consensus of opinion that the machine prevents playing out the men. To save time with it, however, good crane service is necessary, so that there will be no delay in getting the machine into action at the moment the furnace is ready.

One man reported a saving of dolomite to the extent of 5 lb. for each ton of ingots. Others, however, stated that there was no appreciable saving on this score, as the men were likely to put more material on a patch and thus make a better job of it. Some of the belts were reported as lasting 25 to 30 days, whereas other speakers said they were getting 10 weeks to 3 months life. It was stated that it was necessary to start the machine operating just before the furnace door is raised, to prevent burning the belt

through radiation from the furnace. Some of the short-lived belts, however, were reported as having been abraded and not burned.

In the summer-time, with extremely hard operating conditions, men using these machines do not slack the job of making up banks, as there is no occasion for so doing. Furthermore, it is said that the material can be placed on the banks more accurately by the machine than is possible by hand.

Austrian vs. American Magnesite

This topic has been discussed repeatedly at these open-hearth meetings. Most of the speakers reported an inability to distinguish any particular advantage of either type of refractory as compared with the other. It was said, however, that commercial stocks of Austrian magnesite appear to vary so much in fineness that the generally uniform character, physically, of the American magnesite makes it a material preferable to use. One man reported getting better results and lower costs with Washington magnesite than with Austrian.

Another man, however, who formerly advocated the use of American magnesite, has changed his viewpoint and now uses no magnesite whatever. He previously put a veneer of American magnesite over the surface of the laboratory at week-ends and found that about Thursday or Friday of the next week he would run into trouble through cutting the banks. Now, however, he is using a prepared dolomite which will run a whole week and into the next one before any trouble begins. He uses more of this new material in weight per ton of ingots, but it costs less. Formerly he used about 34 lb. of magnesite for all purposes, representing 68c. on a ton of charge, and 85c. on a ton of product. Now he uses 40 lb. of the new material at a cost of 30c. to the ton of charge, or 37½c. to the ton of product. As a result his delays from this cause have been practically eliminated and he is able to schedule his heats

very closely, to meet the needs of the foundry.

Unburned magnesite brick was reported as having been put into bulkheads with very satisfactory results. One man fitted the bulkhead at one end of a furnace with these brick and used a metal-cased brick at the other end. He had to patch the metal-case end after 210 heats, but did not have to touch the magnesite end, even after a much larger number of heats. This magnesite brick is given a metal-case fitting on three sides of it, as indicated in the sketch on next page.

Some plants buy the brick with the metal case on, while others make the metal shells and put them in place themselves. It was explained by the representative of a refractory company that brick of this type, cased with steel on three sides and patented, are being put out. This brick has a chemical binder to hold the magnesite together. One speaker stated that he used these magnesite brick in making the bottom of a furnace 2½ years ago, and thinks that they must have worked all right because he has never heard from them since.

Automatic Control of Fuel and Air

No automatic control is fitted with the Isley furnace equipment, and one speaker thought that such control would involve a very complicated installation. It would be necessary to house in the fans and to arrange control of the air for each end of the furnace separately. Report was made on one furnace at the Homestead works of the Carnegie Steel Co., which is fitted for automatic control. This has a relay which throws the valves over, instead of ringing a bell as does the Isley control. In this case, however, the control is based upon a differential of temperature between the incoming and outgoing ends of the furnace, instead of being dependent solely upon temperature conditions at the hot end.

Keeping a furnace so well balanced that neither end gets hotter than the other was discussed. A good operator

can run a furnace and keep it balanced, but a great many men do not do it. It is in these cases that the form of control on the Isley and other systems is a distinct aid.

Reference was made to a plate glass furnace near Philadelphia, which has been operating for the past four years on a system of control whereby the low temperature at the ingoing end will operate the alarm as readily as the high temperature at the outgoing end. Resulting from this it is possible to keep the cold end from getting too cold and to reverse the furnace whenever either end reaches a condition calling for it. It is claimed that there has been a saving in this case of 25 per cent on refractory costs. The regenerators on this furnace have not

Illustrating Brick with Metal Casing Applied on Three Sides. As each brick rests on the metal of the one below, it is covered, all four sides, by metal

which he saw at the Krupp works, has a supplementary regenerator. In England the maximum regenerator temperatures encountered run about 1300 deg. C. (2372 deg. Fahr.), while a good many do not go above 1000 deg. C. (1832 deg. Fahr.).

An engineer present referred to the fact that for each ton of steel made about 2½ tons of air, and an equal volume of waste gases, are passed through the system. For this reason it is essential that accurate proportioning must govern the various passages through the furnace, beginning with the laboratory, then the ports, downcomers, checkers, flues, valves and stack.

Discussion of the CO₂ measurement as contrasted with measuring oxygen

520 deg. The air going to the furnace is thus heated up to about 1000 deg. About half of the waste gases go through this heater, while the remainder go directly to the stack. A fan, placed on the low-temperature side, is used for the gases, to overcome the resistance through the preheater. This is large enough to take care of peak loads. Another fan is used for the air, both being on the same shaft and run by the same motor.

It was felt, however, that the two should be run separately, so that the speeds could be varied to suit conditions. It was found necessary in this case to put a damper on the air side to get the temperature up to 1000 deg. in place of the 800 deg. previously obtained. This necessarily absorbed more power.

This plant is to be made the subject of careful study by the open-hearth committee of the Corporation, on the basis of running the furnace two weeks with the preheater, then two weeks without and so alternating throughout the next run of the furnace. Probably it will be found advisable in steady operation to change the preheat temperature given to the air at various times during the progress of an open-hearth heat. Otherwise, if this temperature is maintained, the amount of fuel burned might profitably be changed as conditions warrant.

Nozzles and Stopper Heads

Graphite stopper heads and the nozzle, on low-phosphorus steel of 0.08 to 0.10 per cent carbon, are cut in pouring the steel. The question was raised whether this cutting is greater than when killed or semi-killed steel is being made, or when steel of the same carbon content is rephosphorized. No difference on the rephosphorization was reported.

It was stated, however, that rimming steel cuts the nozzle more rapidly than does killed steel. One speaker qualified this statement by saying that this depends somewhat on the temperature, and killed steel can be tapped at a lower temperature than rimming steel and thus save on nozzle and stopper cutting. Another man thought that the greater cutting on rimming steel was due to the slower teeming of the heat. The chairman remarked that cutting is caused by relative absence of silicon.

Magnesite nozzle brick are not in use by any of the companies represented at the meeting. Nozzles of a combination of clay and graphite, however, were reported by one speaker as giving very good service.

Different Kinds of Regenerator Brick

At a previous meeting several men reported experiments under way on the use of silica brick in the upper courses of regenerator chambers, with fire-clay brick below. The Stevens furnace at Indiana Harbor has the upper nine rows of regenerator brick of the silica type. These were reported as giving just as good service

been rebuilt within the past three years.

If gas conditions in an open-hearth furnace remain constant, then the reversals of the furnace will be at pretty regular intervals. When the furnace is being driven fast, however, reversals may come so close together as to cool off the furnace during the many brief intervals in which the change is being made. This was suggested as being a case in which the regenerators are crowded beyond their proper capacity. One speaker expressed the opinion that reversals of the furnace should come at a time when the checkers have been saturated through and through with heat, center and sides being in the same condition. This in the general case should be at about uniform periods.

A man using the Isley system expressed himself as of the opinion that this probably is not the best method of control which can be worked out. It is being given a fair trial in his plant, however, and much is being learned. He believes that furnaces with inadequate regenerative capacity should be operated on short reversal periods. Longer periods can be taken when there is ample checker brick to absorb the heat.

A visitor from England, Edgar C. Evans, fuel officer of the National Federation of Iron and Steel Manufacturers, made some comments on the Mode furnace, which he had seen in operation in Germany. In this case the regenerators are 30 ft. deep and are made of special brick. The temperature measured near the furnace was reported fairly constant at 1500 deg. C. (2732 deg. Fahr.). Stack temperatures on this furnace were reported also to be constant at about 500 to 550 deg. C. (932 to 1012 deg. Fahr.). Another German furnace,

developed the fact that the measurement is ordinarily made on CO₂ recorders because they are commercially available, whereas no satisfactory oxygen recorder, practicable and workable, is on the market. Two speakers took the point that oxygen is the correct measuring stick for flue gases. The amount in the stack should be less than 2 per cent, and in the down-take less than 1 per cent. However, as both oxygen and CO run pretty nearly parallel with CO₂, it happens that the CO₂ measurement works out pretty well as a general guide.

Combustion Control on Reheating Furnaces

Soaking pits and other types of furnace used in reheating steel for rolling are being gradually adapted to the use of combustion control instruments. One speaker reported the use of a preheater on such furnaces where the regenerator capacity is inadequate. This is applicable also to open-hearth furnaces.

Such a preheater of the regenerative type, but with the air flowing always in one direction and the waste gases in the opposite direction, as in a recuperator, is reported to have been in operation intermittently during the last month of a furnace run. That it did not give what was expected of it is laid to trouble with the measuring instruments. On eight open-hearth heats, however, the average reduction in time of making a heat was from 1 to 1½ hr., when compared with 12 heats made previously on the same furnace but without the preheater.

This installation, which is in one of the plants of the United States Steel Corporation, takes waste gases, leaving the furnace at a temperature of 1400 deg. Fahr. or over, and reduces them to practically a constant 500 to

as the fire clay brick previously used.

In general, the speakers reported that the silica brick keep much cleaner, as the grit will not adhere to their surfaces as in the case of clay brick. One instance of this was shown, where five courses of $10\frac{1}{2} \times 4\frac{1}{2} \times 4\frac{1}{2}$ -in. silica brick occupied the top of the chamber and the furnaces were running from 250 to 300 heats before it was found necessary to blow out the accumulation of dirt. This compared with 190 heats average when clay brick were used throughout. The dirt goes down between the rider walls. There was no recovery on this silica brick when they were taken out after a furnace run of 420 heats.

Another plant makes a practice of using four or five courses of silica brick on top, but takes them out, without recovery, after 125 heats, and puts in a new lot. This gives new life to the furnace and speeds up operations generally. In another plant, however, with producer gas as fuel, the use of eight or nine courses of silica brick at the top of the regenerator was discontinued because the gases were hot enough to cut them away almost to nothing.

Another speaker, who uses a large block brick in the large regenerator chambers, uses 9-in. brick in the small chambers of the same furnace and reports that this new arrangement has put new life into the furnace and speeded up the production of steel.

Improved Types of Oil Burners

Divergent reports were made upon types of oil burners in use. One man spoke of using a patented type for several months, but running one gallon more oil to the ton of steel. Another man using a home-made burner put instruments on the furnace to obtain adequate draft control, and thus made an improvement of as much as 7 gal. to the ton; his consumption is now reported down to 25 gal. The draft is run at about 0.4 in. of water, whereas previously it was 1 to 1.5 in. This results in a certain amount of blowing out of gases around the doors of the furnace, cutting the front walls and jambs, but these furnaces have made runs of 769 and 860 heats respectively since the change was made.

Longer life is given to the checkers, and four-fifths of the brick from the checkers are reclaimed. These furnaces have a charge of $27\frac{1}{2}$ tons and make 27 heats in a week, the first one coming out about 7.30 Monday morning and the last one about 2.20 the next Sunday morning. This figures out about 5 hr. 20 min. to the heat in the 139 hr. involved. The oil pressure was given as 21 lb. to the square inch and steam for atomizing is used at 40 lb.

It was said, however, that much can be done on a 27-ton furnace which will not operate equally well on a furnace of 100 tons. The low draft condition cuts out both front and back walls, according to one speaker, who uses 60 lb. oil pressure and 80 lb. of steam.

Another man said that he is getting 450 heats on low-pressure oil and

steam from an 80-ton furnace, where he was unable to go more than about 275 heats on a run when using higher pressures. The heats are made in about the same time under the two conditions. His change was from 130 lb. pressure of oil to 45 or 50 lb., measured at the burner, and his draft was $\frac{1}{2}$ in. of water. His burner passes less oil to the extent of 50 gal. an hour and on cold metal he makes his heats with the use of 33 gal. to the ton of ingots.

Ladle Cars for Hot Metal

A brief report was made on the operation of three hot-metal ladle cars of the American Rolling Mill Co., which were put into operation June 2 last. These carry pig iron from the blast furnace at Hamilton to the open-hearth department at Middletown. The furnace produces 550 tons of iron a day, tapping every four hours. The ladles can take 150 tons, their light

weight being 145 tons. They are run on 16 wheels, there being four axles at each end. Electric operation on the trunnion is utilized to pour this metal into transfer ladles for the furnace. The ladles are used as a sort of mixer or storage, and iron has been held in some of them as much as 16 hr. without causing trouble.

To line one ladle requires about $6\frac{1}{2}$ turns of 10 hr. each. Only four men can work inside the ladle at one time. The lining of a ladle takes 6000 special brick, equivalent to 13,000 9-in. brick. These ladles have been running about five months, before relining, and carrying 40,000 tons of metal in that period. There is reported to be no skull loss in these ladles and only about $\frac{1}{4}$ per cent in the transfer ladles. Adding $\frac{1}{2}$ per cent of kish makes a total loss of about $\frac{3}{4}$ per cent. This ladle was illustrated in THE IRON AGE of June 21 last, page 1746.

Predicts Further Changes in Industry

William R. Basset, of Spencer Trask & Co., Foresees Reductions in Costs, Simplification of Business, New Methods of Selling

"GREAT as have been the basic changes in business in the past 15 years, I confidently look for greater changes in the next 15 years," said William R. Basset, partner of Spencer Trask & Co., investment bankers, New York, in an address at the recent convention of the Associated Business Publishers, Inc., at the Hotel Roosevelt, New York. Mr. Basset said further: "I do not pretend to be able to forecast just what, in detail, these changes will be. However, in their broader aspects they can be stated:

"1. Great reductions in all kinds of costs will expand markets.

"2. Business will be simplified in many respects. Outworn trade customs of many kinds will be discarded.

"3. Channels of distribution will be cleared of needless obstructions. New methods of selling will be devised. Perhaps the slot machine idea will be highly developed and used in many lines of retailing. Selling costs will be greatly reduced by more intensive use of salespeople and by more effective advertising.

"4. Discoveries in pure science will reduce the present markets for certain goods and open markets for new goods. Consumers will discard many of their present wants and develop new ones.

"5. Art will increasingly enter into goods.

"6. It is even possible that uneconomic costly competition will come to be frowned on instead of encouraged by the law.

"The editor of a business paper is better able to sense such changes than almost anyone else, for while a business man is properly immersed in his own business, the editor can be in in-

timite touch with many businesses in his own and affiliated fields and so be in a position to sense trends before they become generally apparent.

"The speed with which business will progress and general prosperity increase will depend to a large extent upon the ability of the business man to foresee these changes and adapt himself to them."

Slight Recession in Industrial Activity

Productive activity in the United States based upon electric energy consumption in 3600 plants showed a drop from 134.5 in September to 132 in October, according to *Electrical World*. Both figures are far above the 119.9 of October, 1927, and all figures are based upon the average monthly activity of 1923 to 1925 as 100. The average for the first 10 months of 1928 was 122.6, which is 6 per cent higher than the 115.8 average of the first 10 months of 1927.

Metal industries showed an advance in October to 144.6, compared with 143 in September. This advance was participated in by both the steel and the non-ferrous plants. This was offset by a sharp drop in the automobile field, including manufacture of parts, and by lesser drops in some of the other major industries listed.

H. C. Atkins Mfg. Co., St. Louis, has commenced publication of a monthly folder called "Nips," which aims to discourse interestingly about the things to look for in a good pipe nipple.

Locomotive Cylinder Planing and Boring Machine

FOR the continuous machining of locomotive cylinders, the Morton Mfg. Co., Muskegon Heights, Mich., is offering the 72-in. stroke traveling head cylinder planing and boring machine here shown. All the planing, boring and milling operations are done by the one machine, the cylinders being completed except for drilling. The machine includes a piston valve boring unit and has capacity for the largest cylinders. When not required for cylinder work the machine may be used for a variety of planing, boring and milling jobs.

Cylinders to be machined are first placed in the floor chucks and made ready for the boring operations. The piston valve chamber is bored and faced by the piston valve boring unit,

5-in. boring bar, cutter heads and cutter support. The port milling attachment may be attached quickly to the square section of the ram without removing the standard planer head. A

matic horizontal feed is provided and there are six feed changes.

Parallels are provided for setting and leveling the cylinder for the boring operations, and provision is made for binding the cylinder. This unit is driven by a 7½-hp. motor, the drive

the main barrel being bored and faced at the same time by the traveling head unit. When boring is completed the cylinder is mounted in special cylinder chucks for planing and milling. The traveling head moves over to the work and on completion of the planing and milling it moves back into position for boring the main barrel of a new cylinder, which in the meantime has been placed in the floor chucks.

In general design the machine is similar to the company's standard traveling planers. When operating as a planer it has feeds either horizontally on the bed or vertically on the column, the horizontal feed being 18 ft. and the vertical feed 96 in. Automatic feeds for the ram, for boring and milling, are provided, and eight changes of feed in each direction are obtainable through a gear box. Boring and milling feeds are controlled by one lever. Power rapid traverse for all motions.

The floor plate is made in two sections and is approximately 15 by 20 ft. The chucks are of three-jaw universal type, the jaws expanding into the counterbore of the cylinder. The main barrel boring outfit consists of a

10-in. face mill is part of the regular equipment, and a one-piece work table, 30 in. high, 36 in. wide and 8 ft. long, is furnished. The push and pull cut head is threaded to fit either the planer head or the grip ring. The special extension head is designed for planing the upper frame fit of piston valve cylinders.

The machine is driven by a 10-hp. reversing motor, the power being transmitted through miter gears and vertical shaft to the operating mechanism in the vertically moving apron. The reciprocating motion of the ram is controlled entirely by the reversing motor drive. Longer beds and columns can be furnished and two traveling head units can be mounted on one bed, making a double traveling head cylinder planing and boring machine.

The horizontal piston valve boring unit, shown in the separate illustration and at extreme left in the picture of the entire machine, has a 5-in. diameter arbor. The outer bearing for the boring bar has vertical adjustment of 44 in. and horizontal adjustment of 24 in., the adjustments being made by hand. Scales are provided for settings on the column and bed. Auto-

THE Complete Locomotive Cylinder Planing and Boring Machine Is Shown at the Left and the Horizontal Piston Valve Boring Unit Above. All machining, except drilling, may be done continuously, but when needed the machine may be used for other work

being through silent chain, running in oil, to the gear box and friction clutch.

Features of the 13-in. and 16-in. double back geared quick-change screw-cutting engine lathes manufactured by the Porter-McLeod Machine Tool Co., Hatfield, Mass., are described and illustrated in a four-page bulletin issued by the company. The apron is double-walled and all gears run in an oil bath. The spindle is mounted either in bronze or Timken roller bearings. The quick-change gear-box, of unit construction, is bolted to the bed and is of such strength that feed changes, 40 of which are available, may be made while the lathe is under cut.

Easing of automobile manufacturing is continuing in November, according to *Automotive Industries*. Indications are that output for the month will show a decline of approximately 20 per cent from October. Manufacturing changes in a number of large producing factories in preparation for 1929 is in the main responsible for the reduction.

Automobile Axles and Similar Pieces Are Bored, Reamed, Drilled and Tapped

Two-Way Boring and Drilling Machine

FOR heavy-duty boring, reaming, drilling, tapping and other operations on automobile axles and similar pieces, the Defiance Machine Works, Defiance, Ohio, has developed a special two-way opposed, direct motor driven, horizontal boring and reaming machine with Oilgear feed. The machine can be furnished either with single or multiple-spindle heads. The

spindles are of alloy steel and are mounted either in anti-friction or in bronze bearings. Spindle drive gears are of stub tooth form, heat treated, and are inclosed and lubricated continuously either by splash or force feed. The large gears are of the helical type. The machine can be equipped with the Oilgear feed and with mechanical feed having rapid power

approach to work, then rate of feed desired, and with automatic rapid return. The length of the bed height of spindle centers and the fixture are designed to suit particular requirements. Each head of the machine illustrated is driven by a separate 5-hp., 1200-r.p.m. motor and the Oilgear pump by a 3-hp., 900-r.p.m. motor. Floor space is 64 x 228 in., and the weight of the machine is placed at 18,170 lb.

Face Grinder with Hydraulic Table Drive

OILGEAR table drive, permitting wide variation of speed to suit work of different materials and hardness, is employed in the type 74 heavy-duty knife and face grinder here illustrated, which has been added to the line of Bridgeport Safety Emery Wheel Co., Bridgeport, Conn. The machine is also equipped with automatic grinding wheel feed and the company's improved 26-in. sectional type wheel. Tables in 14 different lengths, from 50 to 206 in., can be furnished.

The table, speeds of which range from 0 to 90 ft. per minute, operates on 3½-in. wide flat self-oiling ways that are protected from grit. Thrust from the grinding wheel is taken against the broad flat side of the rear way. The Oilgear pump is piped to a reversible oil motor which drives the table through a short gear train and the work table rack. Reversal of the

table is smooth and uniform even at high speed.

Control of the machine is centralized. From the operating position the wheel may be brought up or back by hand; it may be fed by hand, or the automatic wheel feed may be thrown in or out and the feed set by graduated dial to 0.00025 in. By depressing a foot treadle the operator may reverse the direction of carriage travel at any point or jump the "shipping" dog to bring the table clear of the wheel for unloading and loading the work. The table speed may be changed at any time merely by turning a hand-wheel and the table may be stopped by opening the bypass valve. Quantity and direction of coolant flow may also be controlled from the operating position.

Three driving motors are employed. A 15 or 25-hp. motor drives the grind-

ing wheel through a 5-in. wide silent chain, which is entirely inclosed and runs in oil. The Oilgear oil pump is driven by a 5-hp. motor through a flexible coupling and the coolant pump by a 1-hp. motor. Coolant is pumped from a 50-gal. two-stage settling supply tank which is arranged for convenient cleaning. Two large fully adjustable nozzles are provided at the grinding wheel. Thorough attention has been given to lubrication. Table driving gears and rack are splash lubricated, while the spindle bearings have large reservoirs and the grinding head lead screw is immersed in oil. Zerk high-pressure lubrication is used at other points.

The grinding wheel consists of 12 sections carried in a steel casting chuck. The sections or blocks are 8 in. deep and have 3-in. face, and it is stated that more than 7 in. of the sections can be used with safety. Provision is made for moving the sections

Hydraulic Table Drive Permits Selection of Speed to Meet Particular Requirements. Automatic wheel feed also facilitates operation

forward as they wear away, this being accomplished simply and rapidly. A complete set of alining shoes for obtaining proper alinement in setting up the machine are furnished. Equipment also includes either angle bar or revolving knife bar, and a magnetic angle bar, magnetic knife bar or magnetic chuck are available as extras.

Width of the table is 22 in., and the height 28 in. The total overhang

of the table beyond the bed rails may be one-fifth of the table length. The spindle is mounted in adjustable ball bearings. With sheet on guards at the ends of the table the floor space occupied by the smallest machine is 8 ft. 6 in. by 17 ft. 2 in., and by the largest grinder, 8 ft. 6 in. by 43 ft. 2 in. The weight of these machines, equipped with knife or angle bar, is approximately 9910 lb. and 19,080 lb.

Vertical Milling and Routing Machine

FOR die and tool room work and milling and routing in brass, steel and cast iron, the George Gorton Machine Co., Racine, Wis., is offering a new vertical milling and routing ma-

The Machine Uses Small Cutters at High Speeds. Sliding head is a feature

chine. The machine is designed to use small cutters at high speeds and although primarily for precision work, the machine is of rugged construction.

A feature is the sliding head which carries the spindle and complete driving mechanism. The minimum distance from the spindle to the column is 15 in., and the maximum distance is 30 in., the area of the working surface of the table being 15 x 22 in. at one setting of the work. The machine will swing a plate 60 in. in diameter and 4 in. thick or a cylinder 22 in. in diameter and 15 in. high. The maximum and minimum distance from the spindle nose to the table is 15 in. and 0 in. respectively.

The drive is by a $\frac{3}{4}$ -hp. vertical ball-bearing motor and rubber V-belt. Ten spindle speeds, ranging from 475

to 3000 r.p.m., are obtainable without back gears or without changing pulleys. Higher speeds can be provided for brass routing and for use of diamond tools. The machine is equipped with a foot treadle, a chip blower that is integral with the motor and a forming attachment for cutting curved surfaces. Changing of cutters is facilitated by a spindle pulley brake. Large diameter graduated dials permit accurate adjustment of the feed screws to fractions of a thousandth. All feed screws are covered and ways are protected. Rotating parts are dynamically balanced.

The ball-bearing spindle is entirely inclosed. It is machined from a solid bar of chrome manganese steel, hardened and ground inside and out, and is splined drive. The sleeve, which is hardened and ground inside and out, slides in a hardened and ground steel bushing. The height of the machine, which is designated as the No. 8-D, is 68 in. overall. The weight is 1600 lb.

Industrial Radiator for Heavy-Duty Service

A RADIATOR to be used with engines of 200 to 300 hp. in industrial work is being put out by the Young Radiator Co., Racine, Wis. As the illustration shows, this is a large unit; it is said to be suitable for cooling engines of the power mentioned in tropical plants or under severe

Impressive Size Characterizes This Radiator

conditions in the oil field. It is built in several sizes, depending upon the horsepower required and the conditions, and is furnished either with or without fan equipment. It was designed especially for contracting work in the oil field, and where conditions render the automotive type impractical.

Screw Pump for Low Lifts

A RECENT development in pumping equipment for handling large volumes of water at low head is a self-contained vertical screw pump unit, which has just been announced by Fairbanks, Morse & Co., Chicago. Although this pump unit is designed mainly for irrigation and drainage service, it can be used for any type

This Self-Contained Vertical Screw Pump Unit Will Deliver 7200 Gal. a Min. Against an 8-Ft. Head

of pumping where the head is not over 8 ft. and where a low cost installation is desired.

The pump is a vertical machine consisting of cast iron spiders, carrying a wood screw type impeller and diffuser, and constructed in such a manner that four wooden corner posts are fastened to the spider and the structure boarded up so that it may be placed vertically in a ditch or stream.

Using a wooden box construction for the casing makes it easy to adjust the amount of lift or change the position of openings. The boards on two opposite sides of the box are permanently fastened to the frame posts, but those on the other two sides can be arranged to suit different operating conditions. These boards can be removed from the discharge side if a head of less than 8 ft. is needed.

These boards can be replaced or removed according to requirements, and the pump always operates with a minimum amount of power. This feature, it is emphasized, contributes greatly to the efficiency of the unit.

This pump is manufactured in a 24-in. size. The inside dimensions of the box are 25-in. square by 12-ft. high. When driven by a 720 r.p.m., 25-hp. motor, the pump is rated to deliver 7200 gal. a min. against an 8 ft. head.

The reach of the machine is 48 in. and the lower horn is designed for 8½-in. and larger cylinders. The electrical rating is 150 k.v.a. and the maximum pressure at the die points is 2000 lb. A 1½-hp. driving motor is employed. Speeds of 21, 27, 37 and 51 cycles per min. are provided.

New High-Speed Milling Attachments

THREE vertical-spindle high-speed milling attachments adapted for manufacturing use have been added recently to the Brown & Sharpe Mfg. Co., Providence, line of milling machine equipment. They are designated as the No. 10 vertical spindle, com-

The Compound Vertical-Spindle Milling Attachment Is Above and the Universal Attachment Is Below

pound vertical spindle and universal milling attachments, respectively, and convenience of control, accuracy of performance and facility of application to constant-speed drive machines are features. Anti-friction bearings are employed for the spindle.

The No. 10 high-speed vertical-spindle attachment is for use where it is desirable to raise the spindle to clear the cutter from the work to facilitate loading, or for milling keyways, slots and other work that requires feeding the cutter into the work

by hand before engaging the power feed of the table. The spindle is always in a vertical plane and has a hand adjustment of 2½ in. Adjustable stops regulate the movement of the spindle when milling duplicate pieces.

The high-speed compound vertical spindle attachment, which, except for the high spindle speed, is similar to the company's previous compound attachments, is for milling angular strips, tableways, etc., in which the spindle is set at right angles to the table. With the spindle in this position the full length of the table travel is available and an end mill can be used instead of an angular cutter for milling the angle.

Full universal movement, adapting the device for such work as drilling, milling angular slots and surfaces, cutting racks, milling dies, molds and other intricate tool work, is the feature of the high-speed universal attachment. This attachment is also provided with a hand-feed adjustment of 1½ in. which adapts it for angular boring or setting end mills into the work. All of the attachments are held securely in position by means of rugged clamps.

Introduces Deep-Throat Spot Welder

A NEW heavy-duty power-driven spot welder, designated as the No. 75-PA-48, has been added to the line of the Thomson Electric Welding Co., Lynn, Mass. Features of the new welder include unusual depth of throat and special construction of the lower horn, which adapts the machine for welding cylinders or tubes of small diameter.

Unusual Depth of Throat and Special Lower Horn Adapt Machine for Welding Small Cylinders and Tubes

Flexible Industrial Track

A FORM of industrial track including flexible units is being made by the Illinois Power Shovel Co., Nashville, Ill. Known as the Clarkson flexible rail, this device was designed to permit a machine mounted on a track to handle materials over a wide space where only a single track is available. The rail shown in the illustration is composed of small cast steel

Rail Which Can Be Bent as Required in Service

sections with stop ears attached. These rest in chairs mounted on cross-ties. Upon shifting this track into the form of a curve, as shown, the inside sections contract, while those on the outside let out, forming a curve of sufficient uniformity for practical purposes.

How Business Is Now Regulating Itself

Rules Adopted at Trade Practice Conferences with Federal Commission—Extent of Enforceability Not Defined

WASHINGTON, Nov. 27.—The trend of American business is toward self-regulation. One of the latest industrial groups to move in that direction is the Association of Manufacturers of Woodworking Machinery. This organization has proposed a tentative list of rules, which will be discussed with M. Markham Flannery, director of trade practice conferences, Federal Trade Commission, at a meeting in Chicago about the middle of December.

"Never in the history of American business has there been a time when self-regulation has received more intensive consideration," Mr. Flannery told a staff representative of THE IRON AGE. "By self-regulation I mean workable rules prescribed by an industry for its own business conduct, with due regard for the public interest. If an industry is capable of self-regulation the trade practice conference procedure of the Federal Trade Commission affords the most effective method yet devised to accomplish this end."

Self-regulation, Mr. Flannery pointed out, is not an innovation. It has been attempted with varying success for many years, it was explained, the degree of success attained in any industry being readily measured by existing competitive conditions therein. In the event that these conditions are all that can be reasonably desired the success attained is complete, but if practices still exist that result in unfairness or are otherwise bad, self-regulation has failed.

Self-Regulation Demands Means of Enforcement

"Trade associations, 'institutes,' the Chamber of Commerce of the United States and business organized in other forms have done and are doing excellent work," Mr. Flannery continued. "Competitive conditions in many industries are being studied and intelligently analyzed, codes are being adopted, much money is being expended in educating industry for the work of self-regulation. But when the faults are discovered and rules adopted for their correction, it remains for the trade practice conference to supply, in a measure at least, an element that heretofore has been completely lacking—namely, enforcement."

Self-regulation without rules would be impossible, Mr. Flannery said, and rules without some power of enforcement make self-regulation in some instances a mere expensive gesture. The fact that some power rests, as it does, in an impartial, disinterested

governmental body obviates the necessity for its frequent use, he said. To support this statement, Mr. Flannery cited the fact that of more than 300 rules adopted by industries in trade practice conferences, the power of the Federal Trade Commission has not been invoked with reference to a dozen of these. A complete study of the effect of past conferences, now being made by the division of trade practice conferences, may change these figures or disclose some additional reasons, but regardless of the showing on final analysis, Mr. Flannery said, the fact remains that the mere probability that any rule may be enforced adds materially to its general observance.

It was explained that in formal complaints issued by the commission against one who has violated a rule, the charge is based on violation of the statute, not on violation of the rule. Before considering the extent to which trade practice conference rules may be enforceable, Mr. Flannery dealt with the underlying principles and nature of the trade practice conference procedure.

Industry Entitled to Fair Competitive Conditions

It was pointed out that the primary interest of the commission naturally is the interest of the public, which is entitled to the benefits that flow from competition, while competitors are entitled to fair competition. Thus the legitimate interests of business are in harmony with the true interests of the public. Trade practice conferences, it was stated, afford a common ground upon which representatives of business or industry may meet and frankly discuss and agree to abandon any practices or methods which, in their common opinion, are unfair, harmful or against the public interest. This procedure deals with an industry as a unit and is concerned solely with practices and methods. It regards the industry as occupying a position comparable with that of "friend of the court" and not that of the accused. It bans, on a given date, all unfair methods condemned at the conference and thus places all persons engaged in the affected industry on an equally fair competitive basis. It performs the same function as a formal complaint without bringing charges, prosecuting trials or employing any compulsory process. Also it multiplies results by as many times as there are members of the industry who formerly practiced the methods condemned and voluntarily abandoned them.

Representatives of a given industry assemble in conference over which a commissioner of the Federal Trade Commission presides, looking after the interests of the public. The industry proposes, discusses and adopts resolutions defining and denouncing such practices as, in the opinion of the conferees, should be abandoned for the good of the industry. These resolutions, with a report, are submitted to the commission as a whole. Following consideration, the commission may approve, accept or reject the resolutions, in whole or in part. Resolutions approved or accepted by the commission are regarded as rules of business conduct for the government of the industry on the subjects covered. These are usually grouped according to the nature of the practices that they condemn.

Rules Adopted Fall into Two Classes

Group I rules are those that the commission affirmatively approves, thereby stating in effect that those who carry on practices condemned by such rules may be named as respondents in formal complaint. Group II rules condemn practices regarding whose illegality the commission expresses no opinion, but which it accepts as unfair methods of competition as interpreted by the trade. The rules in this group cover a wide range. They deal with practices whose illegality is uncertain, as well as those that may be regarded merely as bad business methods. The only statutory guide to the nature of practices that the commission by Section 5 of the Federal Trade Commission act is empowered to prevent is found in the declaration that "unfair methods of competition in commerce are . . . declared unlawful." Mr. Flannery cited the decision of the United States Supreme Court in the so-called Gratz case which stated that the words "unfair methods of competition" are not defined by the statute and that their meaning is in dispute. The opinion said that it is for the courts, not for the commission, ultimately to determine as a matter of law what they include. It was held that the words are "clearly inapplicable to practices never heretofore regarded as opposed to good morals because characterized by deception, bad faith, fraud or oppression, or as against public policy because of their dangerous tendency unduly to hinder competition or to create monopoly. The act was not intended to fetter free and fair competition, as commonly practiced by honorable opponents in trade."

Mr. Flannery said that the adoption of rules of business conduct at a trade practice conference by the majority of an industry, if free from collusion or fraud, determines the competitive practices that constitute "fair competition as commonly understood and practised by honorable opponents" in their particular trade. Any who violate their self-imposed obligation to abide by these rules, the adoption of which was based upon mutual consideration, and the good faith of all, it was declared, would appear to be guilty of "bad faith."

Enforceability of Group II Rules Still in Doubt

The policy of the commission, as officially announced with reference to this question, was stated as follows: "It is a matter of public impor-

tance that the question of the enforceability of Group II rules be judicially determined. To expedite such determination, the commission has taken the position that the clandestine violation of any Group II resolutions by one who has subscribed thereto in consideration of the like subscription by others in the industry is in and of itself an unfair method of competition calling for action by the commission, even though the practice condemned by such rule has not heretofore been held violative of the act by the commission or any court."

Commissioners Humphrey and Ferguson did not concur in the position taken by the commission. They believe that such enforcement is beyond the power of the commission.

As to the minority members of an

industry who refuse to subscribe to Group II rules, Mr. Flannery said, it is not now apparent how there could be enforcement against them unless the commission in considering a specific complaint should conclude that a proceeding could be sustained under the act, regardless of the rule. The public interest, it was declared, dictates that no rule should be received by the commission that would work an undue hardship on the public or on one who has agreed to abide thereby. Such a rule, if not rejected by the commission in the first instance, would be disapproved when its true character became known. Group II rules are usually observed and have resulted in the abandonment of many bad business practices, Mr. Flannery said, to the lasting good and financial benefit of industry.

Copper Industry's Progress Since the War

New Consumption Record This Year and Condition Now Better Than Ever

A COMPREHENSIVE discussion of the past, present and future of the copper industry was presented by William G. Schneider of the Copper and Brass Research Association, New York, at a meeting of the New York section of the American Institute of Mining and Metallurgical Engineers at the Machinery Club, Thursday evening, Nov. 22. His subject was "The Copper Industry; Its Progress Since the War."

The campaign of the industry to regain its normal status, lost as an outcome of the war, was discussed in the first part of the address, followed by an enumeration of the agencies by which recovery was brought about, Copper Exporters, Inc., the Copper Institute and the research association itself. The concluding part of the address covered the results which have been achieved and what they mean for the future of the industry. From this part of the address has been taken the following:

World Production Must Be Increased

World production of copper from 1913 and including 1928 is shown in the illustration. It is estimated that for 1928 this will amount to about 1,840,000 tons. This is an increase of about 165,000 tons over 1927. The chart also shows the stocks of refined copper at the end of each year. It is believed that such refined stocks by Jan. 1, 1929, will be slightly above 40,000 tons, taking into consideration advance sales, and if it is at all possible to prevent it, in no event will they go below this level. Export shipments for 1928 also will show an increase and will probably total about 700,000 tons.

It is plain that the world produc-

tion of copper must be increased. It is estimated that by 1934 this must be about 2,240,000 tons, as compared to 1,840,000 tons for 1928. This means that the world will demand all the copper North and South America can produce from present mines, and will,

menace to the entire United States industry, but will be needed in the years to come to augment some of our own production. During the next few years a greater production of copper is absolutely essential, from the Southwest, far West and South Amer-

World Output of Copper and American Consumption and Stocks Over a Period of 15 Years

in addition, be able to absorb all the copper which Africa can produce by that time.

African Copper Not a Serious Menace

There is no question but Africa is a potential field, capable of producing large quantities of copper. At the present time African copper fields lack capital for the proper opening, on a sufficiently large scale, of known large deposits. There are also transportation difficulties, and I am sure that there will eventually be some difficulty in obtaining sufficient labor at the right price if many properties start producing. In my opinion, African copper is not such a serious

ican properties. It certainly will be needed, other conditions remaining normal.

New Record This Year in American Consumption

Estimated United States consumption is also charted. It is believed that during 1928 the country will have consumed close to 1,000,000 tons of copper, which is an increase of 160,000 tons over 1927 and 100,000 tons over 1926, and the largest ever consumed by this country in any one year. This consumption is sure to keep increasing unless the proper steps toward finding new markets or holding old ones are neglected.

I feel that for a long time to come

the copper industry will remember the past seven years and will not again let things "go by the board." The continuance of active sales promotion activities through its various associations is recognized by the leaders of the industry as absolutely essential and will be continued for many years to come. The foregoing data are based on figures compiled by the American Bureau of Metal Statistics, covering the first ten months of 1928.

There are markets for copper at any price, irrespective of whether it is selling at 12, 13, 16, 18, 20c. per lb., or even higher. An increase in price does not necessarily mean that curtailment of use must follow. There are needs which only copper can supply and here it will have to be used irrespective of price. There is also today a wider recognition of the merits of the metal, and it is hardly to be supposed that, because the price advances, the demand for it will fall off.

Higher Prices Will Not Affect Use

If one were to consider the use of copper in any finished commodity, I am certain it will be found that the value of the metal figured say at 16c. or higher, will have but a small influence on the retail selling price of the article in question. For instance, in an automobile selling around \$1,500, an increase in the price of copper of 5c. per lb. should only add about \$3 to the cost of manufacture. In an adding machine, selling for \$250, the added cost would amount to about 15c.; in an alarm clock, selling at \$4, it would add about 10c.; and in a \$15,000 house, possibly \$10. The sales value of copper and its alloys is firmly established for many purposes and the purchasing public looks for the metal as an indication of quality and that value is being received. It is hardly to be supposed, therefore, that a few cents difference in the price of the finished article or commodity will deter a prospective purchaser.

From this look into "copper's book" one can see how the industry has progressed for the last seven years. In 1921 there were large stocks of metal, no production because it was unprofitable, outlets for the metal had been closed because of the use of substitutes, no new markets were in sight and in fact the entire industry was demoralized. In 1928, after seven years of applying the methods and practices previously mentioned, we find that stocks of metal have been reduced to the point where the situation is, if anything, acute; production is 100 per cent of capacity at the end of 1928; many markets that turned to the use of substitutes are now again using copper; many new markets have been developed or are in the process of development. In fact at this time there is no single cloud in sight that would indicate that there was anything but prosperity in store for the copper industry for some time to come. The very agencies which brought about this prosperity will, if kept going, assure its continuance.

Pittsburgh Chapter Formed by Scrap Institute

The sixth chapter of the Institute of Scrap Iron and Steel was organized at a meeting held at the William Penn Hotel, Pittsburgh, Wednesday evening, Nov. 21, at which 55 scrap iron and steel merchants and brokers, representing at least 40 firms engaged in the business in Portsmouth, Steubenville, Canton, Massillon, Cleveland and Youngstown, Ohio, Detroit, Erie, Pittsburgh and Johnstown, Pa., were present. The new section was started with 30 subscribing firms and is to be known as the Pittsburgh chapter, but as one of the primary purposes of the institute is to foster cordial relations among the membership through monthly meetings of the chapters, it was realized at the organization meeting that the enrollment is so widely scattered that frequent meetings were not likely to be feasible. Accordingly, it is probable that additional chapters will be formed out of the Pittsburgh chapter, with the latter to embrace only the members within the Pittsburgh district. Chapters were suggested at Detroit, at Youngstown, to take in members engaged in the business in that city, Canton and Massillon and at Cleveland.

Charles Dreifus, president Charles Dreifus Co., Pittsburgh, was elected president of the Pittsburgh chapter; H. N. Trimble, Pittsburgh, chairman of the executive committee; M. B. Speer, Rotter & Speer Co., Cleveland, first vice-president; Isaac Wilkoff, Wilkoff Co., Youngstown, second vice-president; E. H. Schwartzenberg, Cleveland, third vice-president; I. W.

Solomon, Pittsburgh, secretary; Fred Wimmer, Hausman & Wimmer Co., Pittsburgh, treasurer, and H. Tuch, United Iron & Metal Co., Pittsburgh; Jay G. Stephens, Jay G. Stephens Corporation, Pittsburgh; J. E. Jacobson, Luria Brothers Co., Pittsburgh; Hugh Ruffner, Wellsville Iron & Metal Co., Steubenville, Ohio, and Harry Cohn, A. H. Cohn & Co., Butler, Pa., directors.

Benjamin Schwartz, director general of the institute, who presided at the meeting, explained the aims and purposes of the new organization, and pointed out many of the evils that had crept into the business, which called for elimination if the industry is to take its proper place as an important adjunct to the iron, steel and metal industries. He expressed the belief that the scrap industry had not adjusted itself to the hand-to-mouth systems now generally observed in not only the iron and steel business, but in the business world at large. He mentioned a number of problems immediately confronting the trade, emphasizing the tendency toward amalgamation among both producers and consumers of scrap and the growing disposition of consumers to buy scrap direct from producers. An organized effort on the part of the institute to secure more equitable freight rates on scrap; the setting up of a code of business ethics; education of the dealers in the needs of the consumers; clarification of specifications; an arbitration committee to settle disputes between dealers without recourse to the courts and credit service were among the activities Mr. Schwartz believed the new body might properly engage in.

Vertical Casting 16 Ft. High

WATER condenser connection made by Caldwell Foundry & Machine Co., Birmingham, for the Alabama Power Co. It was cast vertically, all metal being poured at one time. It is 16 ft. 2 in. in length and weighs 36,410 lb. Both ends are faced and drilled. The outside measurements are 8 ft. 8¼ in. at the large end and 6 ft. 8 in. at the small end. Inside it measures 7 ft. 4 in. at the large end and 5 ft. 6 in. at the small end.

Business Analysis and Forecast

Business Volume Tends to Taper Off

Downward Movement of P-V Line Indicates Approaching Recession — Too Much Speculation for Health of Industrial Structure

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

WHILE the net balance of the fundamental factors and the more significant indexes is somewhat less favorable than it was a month ago, probably the most notable change is the setback in retail trade. Also, the underlying trend of building permits and contemplated new construction continues to be downward. We are getting used to the higher money rates, but the fact remains that new bond issues are much curtailed; the cost of funds is so high in comparison with yields on invested capital that the result must be a tendency toward restricted investment. If we add to these factors the decline in commodity prices, the drop in farm purchasing power below a year ago and the fearful development of speculation in stocks, it should become obvious that business factors are not all favorable. It is fairly clear that supplies of commodities have on the average gained on the demand.

But these less favorable conditions are still offset by the prevalence of optimistic sentiment and the evidence of expansion in several of the key industries. Thanks to a large volume of public works and utility construction, building contracts ran high in October. The automobile and steel industries show great activity, in spite of a seasonal decline. Merchandise exports made a record in October, and the importation of some \$50,000,000 in gold, along with a decrease in member bank borrowing at the Reserve banks, has eased the credit situation. The outcome of the national election seems to assure stability of political conditions.

The less favorable trend of the P-V line barometer is not expected to be reflected in business developments for at least three or four months.

Thus the outlook for general business indicates a condition that will on the average amount to stability. The

outlook for earnings continues to be fair to good. A satisfactory level of purchasing power exists. Some recovery is indicated among those industries that have been backward during recent years. These conditions should counteract a little recession in some of the more active lines, which seems likely to show up in the November and December figures. The outlook in general is favorable for the remainder of the year and for the first month or two in 1929.

Barometer Says Decline Is Impending

OUR P-V line (a ratio of commodity prices to the physical volume of trade) took a definite downturn in October. The decline was not sharp, but it makes a forecast of some recession in general business within from four to six months from October. The same remark

Factors in the General Business Outlook

Favorable Factors

- (1) Construction contracts awarded increased more than usual in October.
- (2) October factory employment made a good gain.
- (3) Railroad freight traffic showed a more than seasonal increase.
- (4) Merchandise exports increased last month and were large.
- (5) Demand for steel and copper is well sustained; unfilled orders of the Steel Corporation increased a little.
- (6) Sizable gold imports have tended to ease credit.
- (7) Republicans win the election.

Unfavorable Factors

- (1) The P-V line turns downward.
- (2) Retail trade made a less than seasonal gain; department store sales lower.
- (3) Trend of building plans and permits is downward; bookings of structural steel drop sharply.
- (4) Farm income below a year ago, and purchasing power of the farm dollar lower.
- (5) Speculation is excessive.
- (6) Brokers' loans more and more excessive; banks sell securities and see their deposits decline, as funds flow into speculation.
- (7) Money rates high, restricting security issues.
- (8) October business failures numerous.
- (9) Commodity prices lower; steel scrap declines.

Downward Movement of P-V Line Indicates Approach to a Decline in Business and Industrial Volume. Steel production (adjusted) continues high

Retail Trade Shows a Tendency to Fall Off. Wholesale trade remains slow, while industrial production is progressing at a high level, though somewhat below a normal ratio with final sales

Both Building Activity and Automobile Output Show High Activity. But indications now are that tapering off is to be expected

Unfilled Orders, While Downward, Are Moving Narrowly About the Axis; Stock Prices Are Making New High Records and Scrap Prices Are Again Lower

applies to steel ingot production. Indications based on this barometer are that no considerable further expansion will be shown in the adjusted curve of steel production, and that a moderate setback will appear in the not distant future. Whether it will be a short dip, as in 1926, or a longer decline, as in the first half of 1925, it is yet too early to say.

Apparently the estimated value of the industrial output of the country is rounding off for a year-end decline such as occurred in 1926 and again in 1927. Any such decline this year would be partly due to the lower commodity prices, and partly to a recession in the automobile and steel industries that is somewhat greater than usual for the season. It would be in accord with the trend of the P-V line.

General Trading Less Favorable

RETAIL trade showed a clearly downward trend in October. October this year was a long month, having 4 per cent more working time than a year ago. Naturally, comparisons with September are especially favorable, as that month was a short one. Even so, department store sales decreased from September and the increase over a year ago was less than 4 per cent. Other retail trade figures are affected by the constant opening of new stores. We can only say that they made less than the usual seasonal gain in October. The general trend, therefore, was downward.

Wholesale trade slumped in September, the latest month for which we have figures. The only lines that increased in sales volume were meats and furniture.

While the value of the industrial output in September was high in comparison with wholesale sales, it is still low when compared with the retail trade curve, as shown in the second chart. As already indicated, however, the retail index is so affected by new stores that it is not satisfactory. In comparison with the level of department store sales, the industrial production value curve appears to be a little above the average relationship. The situation is thus less favorable than last month, but there is no such maladjustment as existed in 1923 and again in 1925.

Satisfactory Volume in Automobiles and Building

AUTOMOBILE production, at about 398,000 cars and trucks in October, showed a more than seasonal decline (from the statistical viewpoint). Building contracts awarded, however, increased more than usual for the sea-

son. The average of the two indexes is about on the line of normal trend, which is a fairly satisfactory showing. The significance of the trends for the month is not clear in either case, but it seems doubtful if building has established an upward trend, since building permits and contemplated new work both declined more than usual. The gain in contracts, moreover, was due chiefly to a large volume of public works and utility construction in the New York section.

Less Buoyancy in Steel Indicators

OUR steel barometers this month are slightly unfavorable. The average price of heavy melting steel scrap at Pittsburgh was lower in November than in October. The October increase in the unfilled orders of the Steel Corporation was a little less than usual for the month, causing a decline in the adjusted figure and bringing the rate-of-change curve in the chart below the base line. The average price of a representative group of steel stocks, however, rose a little higher in October than in September. The average for the month was 178, against 173 in September and 152 a year ago.

We conclude that the abnormal speculative situation has carried steel stocks up, though they have advanced less than the average of the more speculative stocks. This movement appears to be contrary to the trend of the barometer lines and largely due to the effects of the general bull market. How long it can continue no one can say. When the inevitable readjustment in the market comes, the steels will doubtless participate in the decline.

Refractories Production Decreased in 1927

WASHINGTON, Nov. 27.—Non-clay refractories to the value of \$22,645,633 were produced in 1927, a decrease of 7.6 per cent under 1926 when the value was \$24,505,519, according to the Bureau of Census. Silica brick production was valued at \$12,756,994 in 1927 as against \$13,614,033 in 1926; magnesite and chrome brick production, \$3,874,176 as against \$4,762,645; refractory cement (magnesite, etc.), \$1,184,121 as against \$1,045,468 and other refractories, including silicon carbide and bauxite brick, \$4,830,342 as against \$5,083,373.

Fire brick production in 1927 was valued at \$37,750,230, a decrease of 11.6 per cent under 1926 with a value of \$42,706,932. The value of fire brick, block, tile, boiler, etc. in 1927

was \$33,866,153 as against \$40,013,394 in 1926; high alumina, \$1,187,096 as against \$978,624 and special shapes, \$2,696,981 as against \$1,714,914.

Railroad Expenditures Less This Year

Capital expenditures for improved railroad plant in 1928 are estimated by the American Railway Association at \$650,000,000. This is the smallest amount so utilized since 1922. It compares with \$771,552,000 last year and \$885,086,000 in 1926. The maximum post-war expenditure was in 1923, at \$1,059,149,000, which is the only post-war year exceeding the expenditures of 1926. For the nine years ending Dec. 31, next, expenditures are placed at \$6,628,296,000, or an annual average of about \$736,000,000.

During the first nine months of 1928, capital expenditures for new equipment were \$165,967,000, a decrease of 19 per cent from the \$204,992,000 for the corresponding period last year. Roadway and structures aggregated \$334,200,000, a reduction of 8½ per cent from the \$365,223,000 in 1927. Additional track cost \$91,241,000, a reduction of 16 per cent from the \$108,002,000 last year. Heavier rail took about the same amount each year, with \$34,891,000 in the first nine months of 1928.

Sub-division of the new equipment expenditures for the first nine months shows \$37,121,000 for locomotives, a drop of 30 per cent from the \$53,721,000 last year. Freight cars cost \$89,920,000, or 13 per cent less than the \$104,565,000 of 1927. Passenger cars at \$27,187,000 showed a drop of 13 per cent from the \$31,383,000 of last year. Other equipment accounted for \$11,739,000, compared with \$15,323,000 in the nine months of 1927.

Expects 20 Per Cent Increase in Advertising

An average increase of 20 per cent in the advertising appropriations of many leading industrial and business concerns was forecast in the address of William A. Hart, retiring president of the Association of National Advertisers, at the annual convention at Atlantic City. Mr. Hart, who is advertising director of E. I. du Pont de Nemours & Co., Wilmington, Del., said that over 50 per cent of the membership favored him with a reply to his questionnaire. Less than 6 per cent anticipate any decrease in their advertising programs. Twenty-nine per cent believe their advertising to be about the same, while 65 per cent forecast increased effort.

Schedule of the next instalment of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Dec. 20—Position of Iron and Steel Producers.

Lower Concrete Bar Duty Upheld

Refunds to Be Made on Protested Shipments—Decision Will Not Affect Bar-Sized Shape Classification

THE decision of Justice I. F. Fischer of the United States Customs Court, Second Division, given on Jan. 31, this year, that deformed bars are structural material, as such are dutiable under Paragraph 312 instead of Paragraph 304 of the tariff act, has been upheld by the United States Court of Customs Appeals, Justice Graham presiding.

In rendering its decision upholding Justice Fischer, the Court of Appeals points out that corrugated bars have upon their surfaces ridges and protuberances so placed and spaced as to make them suitable for holding when embedded in concrete construction. "The principal use of this material, as shown by the testimony, was for reinforcement for concrete. A minor use of the same is shown by the record for making ornamental grill and other iron work, but it is not contended that this is a major, or even an important, use of the product. It is not used for forging or machine work, because of its deformations. It is also disclosed by the evidence that this material is used in conjunction with concrete in making floors, conduits, bridges, walls and, in fact, practically every structure where concrete is used.

"The testimony further discloses that, where used in a building, the plans and specifications prepared by the engineer or architect specify the location, size and strength of such reinforcing material, and that, when so used, the ends of the bars are usually bent in such a form that they can be anchored by means of stirrups, or otherwise, to the wall columns or laterals of the building, and, after having been so placed, are surrounded with concrete and become a permanent part of the building, and cannot be removed without endangering the stability and strength thereof.

"It is further shown that these are used in all buildings of steel construction, wherever concrete work is needed, and are also used as reinforcements in concrete buildings or structures where no steel framework is used. The bending of the ends for attachment to the other members of the building is done by workmen, usually in the progress of construction; when this material is imported it is straight, without any such finishing. When a structure in which such material is used is completed, the said material assists in carrying both the dead and live loads of the building, has the capacity to resist great tension and compression, contributes to the stability of the structure and becomes an integral part of the skeleton of the same. The imported material has not been assembled, manufactured or advanced beyond hammering, rolling or casting.

"The only question for our decision is whether the court below erred in holding, under this proof, that said

material constitutes 'structural shapes' of steel. We incline to the view there was no error in so holding."

The court then cites the case of the United States vs. Frank and the case of Simon, Buhler & Baumann vs. the United States in deciding that the lower court was correct in considering the reinforcing bars in question as structural shapes.

The court then says: "In conclusion, it is argued that if the deformed bars in issue here are to be treated as structural shapes of steel, then all steel which goes into a structure and becomes a part thereof must be so treated. This does not follow, and this opinion should not be taken as so holding. The classification of such steel will, in each case, depend upon its designation, character and use, whether it ought, properly, to be considered as material or structural shapes and forms."

Importers of steel, who have brought into the country some substantial quantities of reinforcing bars, on all of which they have paid the full duty of 30c. per 100 lb. specified in Paragraph 304, at the same time entering protest, will be entitled to refunds, as Paragraph 312, the new classification, exacts a duty of 20c. per 100 lb.

It is suggested by importers that the final paragraph of the decision, pointing out that it does not follow that all steel that goes into a structure must be treated as structural material, removes this case as a precedent that might be cited should a hearing be called on the question of classification of bar-sized shapes. That product was recently placed by the Treasury Department under the bar paragraph instead of the structural, thereby increasing the duty.

Pig Iron Anti-Dumping Order Revoked

WASHINGTON, Nov. 27.—Revocation of the anti-dumping order against imports of pig iron from Germany, announced last Thursday by Secretary of the Treasury Mellon, was a formality that had been expected. Imports of pig iron from Germany since the order went into effect Jan. 29, 1927, have been small. During all of 1927 they were 9211 gross tons, while for the 10 months ended with October of the present year they amounted only to 395 tons, the latest movement having been 300 tons which arrived last July.

The anti-dumping penalty is considered to have been less of an influence than the rising cost of production in curbing imports of pig iron from Germany. It is stated that costs of making pig iron in Germany are now as high as they are in the United States, and a prominent Ger-

man producer recently declared that pig iron is produced more cheaply in Alabama district than in Germany.

The anti-dumping order followed protests from Eastern merchant furnace operators against heavy shipments from Germany at prices which it was contended were lower than the German home market levels. Application was made for an anti-dumping order. It was granted. There also was pending an application before the Tariff Commission for a 50 per cent increase in the pig iron duty. This increase was proclaimed by President Coolidge, but it is considered doubtful that this higher duty has had much effect in checking pig iron imports. The duty increase of 37.5c. per ton is declared to have been small when measured against rising costs of production.

In revoking the order concerning German pig iron imports, Secretary Mellon instructed customs officers to maintain a continued scrutiny so as to guard against renewal of the practices which brought about issuance of the order.

More Stable Employment in Iron and Steel Plants

Studies made by the United States Bureau of Labor Statistics show that 32 identical plants in the iron and steel industry have had an average of about 94 per cent full-time employment from the beginning of 1926 through August, 1928. For the calendar year 1926 this was 94.3 per cent; it was 93.6 per cent in 1927, and for the first eight months of this year has been 94.2 per cent. The 32 plants reporting employ, collectively, about 40 per cent of all the workers in the industry. These figures compare with 91.2 per cent in 1925; 88.3 per cent in 1924, and 88.9 per cent in 1923—the latter for 30 companies only.

During the first eight months of 1928 two of the companies showed more than 98 per cent full-time employment. Two others were over 97 per cent, and 10 more exceeded 96 per cent. Less than 10 per cent of the total in the past three years has been below 90 per cent. Consistent improvement has been shown by many of the plants since the earlier years covered in the survey.

Oakite Products, Inc., Holds Annual Sales Conference

Completing 20 years of industrial cleaning service, the technical staff, field service men and executives comprising the organization of Oakite Products, Inc., met in the general offices in New York, Nov. 14 to 17, for their annual sales conference. District managers and representatives from 33 States and Canada came together in daily discussion, subjects of which ranged from the cleaning of watch crystals to ocean liners and silk stockings to 80,000-bbl. oil storage tanks. There were 19 papers discussed.

Automotive Meeting Well Attended

Production Executives Discuss Costs, Materials Handling, Time Study and Other Shop Problems

HELD at the center of automobile manufacturing activity and offering a program of high caliber, the annual production meeting of the Society of Automotive Engineers, at the Book-Cadillac Hotel, Detroit, Nov. 22 and 23, attracted an unusually large attendance. Twelve papers and six committee reports were presented at the five technical sessions and the production dinner featured an address by K. T. Keller, vice-president in charge of manufacturing, Chrysler Corporation, Detroit.

First of the technical papers read was, "How the Ford Motor Co. Gets Its Low Production Costs," by John Younger, professor of industrial engineering at Ohio State University. He began by citing the 15 basic laws of manufacturing management as codified by L. P. Alford, in 1926, and claimed that the Ford company has been using them for years. The rest of his paper outlined methods in various Ford plants, and spirited discussion followed Mr. Younger's presentation.

The second paper of the morning session was by L. A. Baron, "Accounting for Depreciation as a Production Cost." Mr. Baron, who is Comptroller of the Stutz Motor Car Co., began by quoting a statement made by the Chamber of Commerce of the United States, to the effect that the business man who does not charge depreciation at all is fooling himself. This paper was well received and also provoked active discussion.

An outstanding paper of the afternoon session was "Integral-Contact Gearing," by A. B. Cox, consulting engineer, Wilkensburg, Pa. The paper dealt with problems of gear-tooth breakage, wear and noise. Integral-contact gearing, it was held, is the solution of most of the baffling problems of gear-tooth fatigue and breakage, wear and pitting and vibration and noise. Mr. Cox illustrated his paper with a large number of stereopticon slides, showing tooth contact in stub-tooth and other types of gears.

The production dinner held under the auspices of the Detroit section of the S. A. E. in the main ballroom of the Book-Cadillac Hotel, was attended by 670 members and guests. This number so far exceeded the provisions made for the dinner that tables had to be laid on the balconies and even out in the foyer of the ball room. At the speakers' table were E. P. Blanchard, Bullard Machine Tool Co., Bridgeport, Conn.; B. J. Lemon, United States Rubber Co., chairman of the Detroit section; G. W. Wall, consulting engineer, Indianapolis, president of the S. A. E.; W. R. Strickland, of the Cadillac Motor Car Co., president-elect of the S. A. E.; Coker F. Clarkson, general manager of the S. A. E.; J. M. Crawford of the

Chevrolet Motor Co., chairman of the meetings committee of the Detroit section; E. P. Warner, Assistant Secretary of the Navy for Aeronautics; F. E. Moskovics, president of the Stutz Motor Car Co. of America; S. P. Thacher, second vice-president of the United States Rubber Co.; K. T. Keller, vice-president in charge of manufacturing, Chrysler Corporation; H. M. Crane, chairman of the technical committee, General Motors Corporation; L. Clayton Hill, Murray Corporation of America; V. P. Rumely, Hudson Motor Car Co.; J. H. Hunt, Chevrolet Motor Co., past-president of the S. A. E., and L. L. Roberts, Packard Motor Car Co.

A number of those at the speakers' table made short speeches. In his address on "Production—Men, Methods and Machines," K. T. Keller, speaker of the evening, pointed out that in the rapid development of the automobile industry a new type of engineer has been developed who is as much an integral part of the industry as the mechanical engineers who design the cars. He predicted that production engineers would soon be fully as important and numerous as the mechanical engineers.

Session Devoted to Materials Handling

In addition to three papers, the comprehensive report of the materials handling subcommittee provided much interesting data at the opening session, Nov. 23. New conditions in the transportation, storing and fabrication of materials in the automotive industry were outlined in the report of the subcommittee, which is headed by V. P. Rumely, Hudson Motor Car Co., Detroit.

"Today the universal desire to operate with a minimum inventory in all plants creates a greater need for more rapid movement of stock," states the report. "This requires more mobile equipment than heretofore. Larger production schedules involve greater volume of materials, which in turn justify larger and faster units for handling. It is not uncommon today to find a plant manager operating the factory with few if any stockrooms. Materials are taken from freight cars and trucks in suitable containers directly to the manufacturing department and placed into production with no rehandling."

Some of the important developments in material handling equipment and methods, including the handling of sheet steel, are outlined in the committee's report. The papers at this session were: "Assembly Plant Layout for Material Handling," by N. H. Preble, Mechanical Handling Systems, Inc.; "Selection of Conveyor Power Units," by C. E. Broome, Gears & Forgings, Inc.; and "Possibilities and

Limitations of Conveyor-Chain Curvature," by J. B. Webb, J. B. Webb Co.

"Power Transmission Engineering as Affecting Production and Cost," by W. W. Nichols, D. P. Brown & Co., was an outstanding contribution to the power transmission session, which followed the materials handling meeting.

Outlines Characteristics of Carboloy Tool Material

The last session of the meeting, under the chairmanship of Guy Hubbard, National-Acme Co., Cleveland, had a generous program. In addition to a paper on the "Interpretation of Production Records," by Paul Geyser, General Motors Truck Co., and another on "The Relation of Time Study to Manufacturing," by L. W. Haskell, Dodge Brothers, Inc., G. N. Sieger, sales manager, Carboloy Co., 350 Madison Avenue, New York, spoke briefly on the "Development and Uses of Carboloy."

The full possibilities of this new tungsten carbide tool material, described in THE IRON AGE of Oct. 18, were said to be as yet unknown.

"Carboloy has outstanding characteristics," said Mr. Sieger. "It is extremely hard but its outstanding weakness is that it is not very tough. It will scratch a sapphire, yet it is not a complete substitute for the diamond. It is being used successfully in drawing dies, and even in diamond tools. The turning of Hatfield manganese steel, until now practically unmachinable, yields readily to Carboloy."

Elkonite, advertised as unmachinable and only to be finished by grinding, was said to be turned at a rate of 130 ft. a minute by Carboloy tools. Mr. Sieger gave figures on a number of jobs where Carboloy had been remarkably successful, including its use in machining aluminum bronze. He said that his company does not believe that Carboloy is going to revolutionize the industry or even replace any of the popular cutting steels of today, but that they believe it has a definite place in production methods.

In the discussion following Mr. Sieger's paper, C. R. Burt, general manager of Pratt & Whitney Co., Hartford, Conn., spoke briefly on the new Widia alloy, another tungsten carbide material, developed by the Krupp Steel Works, Essen, Germany, and described in THE IRON AGE of Sept. 27. Speaking of a demonstration he had witnessed in Germany, Mr. Burt said: "In one instance there was a test made on a bar of 8-in. steel, making a cut of about ½-in. in depth with a fine feed, which is necessary, I am informed, in using that alloy, the feed being about 0.020 in. The first demonstration was at a speed of about 300 ft. a min., and it was not a short cut. Two points surprised me; one was: after taking this high-speed cut there was practically no heat in the steel. The heat seemed to have been carried away with the chips, and it was also surprising to

note the very fine finish that it left, partly due, I suppose, to the fine feed.

"I brought back from Germany about 15 or 18 of the Widia alloy tools for experimental purposes. Some of them were finished tools and others were tips which we intend to braze on. We ran into some difficulties simply because we did not understand how to use them. The way the tool is ground is very important. After the grinding operation it is also advisable to give the tool a high finish by buffing. The higher the finish, the better durability you get from the cutting tool.

"I understand that several factories have increased their production 4 to 1 with these tools. They also found the tools would last, in many cases, for one week between grindings, while previously it was frequently necessary that the same tools be ground every day."

"The Widia tools are similar to the Carboloy in that they are extremely brittle," said Mr. Burt in another

part. "They have to be handled with care, and the grinding of the tools, I believe, is one of the most important factors in getting good results. The different shapes have a great deal to do with it. I think, from what I learned over there, one would not always use the same shape that we now use with high-speed steel. It is necessary to reduce the cut materially. It is a mistake to try to put this alloy in with a heavy cut and a heavy feed. You simply will not get the result."

Mr. Burt spoke of a test of this material he had witnessed in England on a high-speed planer, a new machine which was being demonstrated at the Olympia Show. "It was quite a revelation to me for speed," he said. "The table of the planer was traveling on the cutting side at a speed of 280 ft. a minute, with a cut $\frac{3}{4}$ in. deep and about 1/60 in. wide. As the table traveled 280 ft. a minute peeling off the cast iron chips, it gave one the impression that the machine was merely cutting wood."

United States Consumes Half of World's Tin

Consumption of tin in the United States is so large that the annual imports amount to about one-half of the world's production of that metal, according to the United States Bureau of Mines. As the result of a canvass made to ascertain the amount of tin consumed for different purposes in the United States during 1927, the bureau found that 24,527 gross tons of primary or virgin tin was used in the manufacture of tin and terne plate, accounting for 35.65 per cent of the total consumption of primary tin in the United States in that year. Next in order of magnitude as a consuming factor is solder, which required 13,734 tons, or 19.96 per cent of the total. The manufacture of babbitt required 8705 tons, and foil and collapsible tubes consumed 6903 tons. The results of the bureau's inquiry, wherein effort was made to eliminate figures relating to secondary tin, account for 68,797 tons of primary tin, a quantity equivalent to 96.7 per cent of the imports in 1927. The results of this canvass, based on reports from 1050 companies, are tabulated in Information Circular 6084, "Consumption of Primary or Virgin Tin in the United States," by J. B. Umhau, copies of which may be obtained from the bureau.

Warns Against Mania for Mergers

Consolidations Have Disadvantages That May More Than Offset Economies Effectuated

WARNING against the "mania for mergers" was sounded recently by James O. McKinsey, professor of business administration of the University of Chicago, in an address before the Illinois Manufacturers' Costs Association at Chicago.

"The investment bankers," he said, "who largely work out these mergers, may not be particularly interested in your own particular problems. I have a record of 35 mergers each of not less than five companies whose promoters predicted a 45 per cent increase in profits within five years. As a matter of fact, the profits over a 10-year period have been 18 per cent less than they would have been had the companies operated independently."

Some of the disadvantages of mergers as pointed out by Professor McKinsey were:

"While large organizations may have their advantages, especially in banking mergers, some of the customers may feel that they do not receive so distinctive a service. The tendency in large organizations is toward routine and standardization, and lack of flexibility. They cannot make exceptions in policy to meet the needs of a customer.

"One way to overcome this is to maintain the intimate personal contact with old customers by retaining as many as possible of the old executive staffs. This, however, does not decrease the overhead. Frequently, in the case of mergers of companies with competing products, each with a valuable trademark, the company will lose

business in trying to win customers over to one of the two products.

"A company that acquires other manufacturing companies making supplementary products in a measure finds that it loses the business that it formerly enjoyed as a result of concentrating on some specific product. I have in mind a commercial textbook company which undertook to produce every other type of book used in a high school. It was a mistake—an overburdened salesman trying to handle a large variety of products will not do so well as one who specializes in a single product.

"The usual accompaniment of a merger is to undertake the reduction of an over-supply of executives and employees. It is an advantage to eliminate deadwood. It is difficult to secure executives to handle all the larger problems of an expanded business resulting from a merger. A president or sales manager who is doing a business of \$5,000,000 a year frequently cannot efficiently handle a \$25,000,000 a year business although he may grow to it in time if he possesses the necessary intelligence and force.

"In the case of a merger there is frequently jealousy between the former and the more recent group of employees, and it takes diplomacy and care to bring about effective cooperation. Old employees find it difficult to fit into the new picture, especially when they lose contact with the president and other high officials and report to lesser officials. They lose the desire to display initiative, feeling they are part of a chain."

British Metallurgist to Lecture Here

Ulick R. Evans, Cambridge University, Cambridge, England, will deliver the annual lecture of the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers during the annual meeting of the institute in New York, the week of Feb. 18, 1929. His lecture will be on "Corrosion," and he will preside at a symposium on this subject.

Following the annual lecture Mr. Evans will deliver groups of lectures at New Haven, Conn., Cambridge, Mass., Cleveland, Pittsburgh and Washington, with single lectures at various other points.

Cleveland Engineers Visit Rubber Plants

The Cleveland Engineering Society made an inspection trip to Akron, Ohio, Nov. 27, visiting the plants of the Goodyear Tire & Rubber Co. and the B. F. Goodrich Co. In the evening a joint meeting with the Akron section of the American Society of Mechanical Engineers, the Akron section of the American Institute of Electrical Engineers and the Rubber division of the American Chemical Society, was held at the Akron City Club. An illustrated talk on dirigibles was given by Dr. Carl Arnstein, vice-president and chief engineer of the Goodyear Zeppelin Co., and H. H. Timlin told of the Firestone Tire & Rubber Co.'s rubber plantation in Liberia, Africa.

Fabricated Structural Steel

Bridge at New York Takes 26,500 Tons—Awards Total 58,600 and New Projects Call for 25,100 Tons

WITH a bridge at New York to connect Staten Island and New Jersey requiring 26,500 tons and another across the Ohio River at Madison, Ind., 5200 tons, fabricated structural steel awards reported during the week amounted to 58,600 tons. New projects, calling for 25,100 tons, included a Chicago club, which will take 6000 tons. Awards follow:

BOSTON, 1100 tons, Boston & Maine Railroad hotel, to New England Structural Co.
 BOSTON & MAINE RAILROAD, 1100 tons, nine bridges, to Boston Bridge Works, Inc.
 BOSTON & MAINE RAILROAD, 193 tons, three bridges, to Bethlehem Bridge Co.
 NEWTON, MASS., 115 tons, high school, to Boston Structural Steel Co.
 PROVIDENCE, R. I., 340 tons, Providence Institute of Savings, to J. H. Tower Iron Works.
 NEW YORK, 26,500 tons, bridge over Kill van Kull connecting Staten Island and New Jersey, to American Bridge Co.
 NEW YORK, 2500 tons, shoring steel for subway construction for Clemente Contracting Co., Inc., to American Bridge Co.
 NEW YORK, 1100 tons, apartment building on East Eighty-sixth Street, to Hedden Iron Construction Co.
 NEW YORK, 1000 tons, apartment building at 623 Park Avenue, from Starrett Brothers, general contractors, to Hedden Iron Construction Co.
 NEW YORK, 900 tons, public school No. 96, to Harris Structural Steel Co.
 NEW YORK, 800 tons, apartment hotel on East Eighty-third Street, to Easton Structural Steel Co.
 DELAWARE, LACKAWANNA & WESTERN RAILROAD, 700 tons, four bridges at Jersey City, to American Bridge Co.
 DELAWARE & HUDSON RAILROAD, 175 tons, bridge at Lanesboro, Pa., to American Bridge Co.
 WERNERSVILLE, PA., 560 tons, building for Jesuit Novitiate, to Robinson Iron & Steel Co.
 EASTON, PA., 300 tons, Lafayette College engineering hall, to McClintic-Marshall Co.
 NEW MILFORD, N. J., 150 tons, building for Austin Co., to Montgomery Iron & Steel Co.
 PENNS GROVE, N. J., 180 tons steel piling, for American Gas & Electric Co. plant, to Bethlehem Steel Co.
 EAST LIBERTY, PA., 100 tons, additional shelter shed for Pennsylvania Railroad, to Guibert Steel Co.
 HARRISBURG, PA., 337 tons, Zembo Shriners temple, to Jones & Laughlin Steel Corporation.
 PITTSBURGH, 160 tons, coal cleaner building, Hillman Coal & Coke Co., to Jones & Laughlin Steel Corporation.
 PORT HURON, MICH., 285 tons, exchange building for Michigan Bell Telephone Co., to Whitehead & Kales Co.
 FLINT, MICH., 125 tons, high school, to Guibert Steel Co.
 CLEVELAND, 3000 tons, Cleveland Union Terminal Co., catenary bridges and other steel work required for electrification of railroads entering Cleveland Union Depot, to Fort Pitt Bridge Works.
 MADISON, IND., 5200 tons, bridge over Ohio River for J. G. White Engineering Corporation, to Mount Vernon Bridge Co.
 INDIANA & MICHIGAN RAILROAD, 1000 tons, highway bridges, to Indiana Bridge Co.
 LOUISVILLE & NASHVILLE RAILROAD, 1300

tons, bridges, to American Bridge Co.
 NORTHERN PACIFIC RAILROAD, 1150 tons, to American Bridge Co., Minneapolis Steel & Machinery Co. and St. Paul Foundry Co.
 ROCK ISLAND RAILROAD, 200 tons, bridges, to American Bridge Co.
 CHICAGO, 400 tons, social science building for University of Chicago, to Wend-nagel & Co.
 OLYMPIA, WASH., 230 tons, Kalama River bridge, to unnamed interest.
 SACRAMENTO, CAL., 150 tons, Bank of Italy, to Palm Iron Works.
 PORTLAND, ORE., 243 tons, Gardiner bridge on Yellowstone-Trail Highway, to unnamed interest.
 SAN FRANCISCO, 900 tons, plates, three 82,000-bbl. tanks for Shell Oil Co., to Steel Tank & Pipe Co.
 SAN FRANCISCO, 900 tons, plates, three 82,000-bbl. tanks for Shell Oil Co., to Western Pipe & Steel Co.
 SAN FRANCISCO, 1500 tons, bridge work for Southern Pacific Co., to American Bridge Co.
 SAN FRANCISCO, 300 tons, two apartment buildings, Broadway and Octavia Street, to Golden Gate Iron Works.
 LONGVIEW, WASH., 425 tons, saw mill for Weyerhaeuser Lumber Co., to Star Iron & Steel Works.
 ALHAMBRA, CAL., 100 tons, factory for Kay Steel Co., to Union Iron Works.
 LOS ANGELES, 180 tons, Stauffer Chemical plant, to Union Iron Works.
 LOS ANGELES, 1600 tons, apartment building, Wilshire Boulevard and Commonwealth Street, to Union Iron Works.
 LOS ANGELES, 381 tons, three buildings for Paramount Film Corporation, to Union Iron Works.
 LOS ANGELES, 344 tons, office building on South Spring Street, to Llewellyn Iron Works.
 SANTA MONICA, CAL., 113 tons, apartment building, Second Street, to Baker Iron Works.
 HONOLULU, 250 tons, steel barge for Young Brothers, Ltd., to Wallace Bridge & Structural Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PROVIDENCE, R. I., 200 tons, New England Steamship Co. freight shed.
 BOSTON, 1100 tons, three-story addition to North Station for Boston & Maine Railroad.
 BOSTON & MAINE RAILROAD, 1000 tons, 12 bridges.
 BALTIMORE & OHIO RAILROAD, 200 tons, bridge on Staten Island, N. Y.
 MASSENA, N. Y., 2000 tons, manufacturing building for Aluminum Co. of America.
 SYRACUSE, N. Y., 150 tons, Psychiatric Hospital.
 STATE OF NEW JERSEY, 1240 tons, highway bridges; 1100 tons for Ridgefield Park and 140 tons for Metuchen.
 VENTNOR CITY, N. J., unstated tonnage, public school building.
 CAMDEN, N. J., unstated tonnage, Woodrow Wilson Junior High School.

ORWIGSBURG, PA., unstated tonnage, building for St. Francis Orphan Asylum.
 STATE COLLEGE, PA., unstated tonnage, first unit of Botany Building for Pennsylvania State College.
 HOLMESBURG, PA., unstated tonnage, building for Northeast National Bank.
 HERSHEY, PA., 2000 tons, community building.
 UPPER DARBY, PA., 1100 tons, school building; McClintic-Marshall Co., low bidder.
 STATE OF ALABAMA, tonnage not stated, highway bridges.
 CLEVELAND, 600 tons, addition to Moreland Courts Apartments.
 CLEVELAND, tonnage unstated, plant for Geometric Stamping Co.
 CHICAGO, 1000 tons, addition to Washington Park race track pavilion; Chicago Heights Construction Co., general contractor.
 CHICAGO, 200 tons, sales building for Studebaker Corporation.
 CHICAGO, 6000 tons, La Salle Club.
 CHICAGO, 1000 tons, First Regiment Armory, revised.
 CHICAGO, 5000 tons, Fine Arts Building, revised.
 SUPERIOR, WIS., 700 tons, coal bridge.
 ST. LOUIS, 1500 tons, Continental Life Insurance Co. building.
 SACRAMENTO, CAL., 170 tons, bridge over Southern Pacific tracks near Benham; Paul N. White, Santa Monica, low bidder.

Gain in October British Steel and Iron Output

LONDON, ENGLAND, Nov. 21 (*By Cable*).—October pig iron output was 543,600 gross tons and the production of steel ingots and castings was 756,000 tons.

A comparison of the October output with that of the nine preceding months of the year, and with the monthly rate for previous years is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly...	855,000	638,600
1920—Av. monthly...	669,500	755,600
1922—Av. monthly...	408,500	490,100
1923—Av. monthly...	620,000	706,800
1924—Av. monthly...	609,900	685,100
1925—Av. monthly...	519,700	616,400
1926—Av. monthly...	203,500	296,700
1927—Av. monthly...	607,800	758,200
1928—January	560,600	626,200
1928—February	550,800	764,400
1928—March	592,600	793,300
1928—April	555,000	644,100
1928—May	591,500	752,700
1928—June	563,700	709,500
1928—July	537,800	666,900
1928—August	519,000	648,300
1928—September	503,900	718,600
1928—October	543,600	756,000

Large Coal Production

Production of bituminous coal in the week ended Nov. 17 is reported by the United States Bureau of Mines at 10,918,000 net tons. This is slightly above the average of the two preceding weeks and is nearly 1,000,000 tons above the output of the corresponding week of last year. For the elapsed portion of the calendar year, however, production was lower than in 1927, the total through Nov. 17 being reported at 429,971,000 this year, compared with 462,490,000 tons last year. Except for 1924, when the output was nearly 3 per cent lower than this year, 1928 shows the smallest total since 1922, when there was a coal strike.

This Issue in Brief

Dwellings made of "metal lumber" permit the same architectural flexibility as wood. Metal members have holes at 2-in. intervals. No cutting or riveting is required at the job. Armed only with wrenches, mechanics unfamiliar with the work erect the framing with no difficulty.—Page 1347.

* * *

Avoids straight-line production flow to gain flexibility. Equipment in new automatic seamless pipe mills is staggered, with short transfer tables between machines.—Page 1353.

* * *

Approaching business recession indicated by downward movement of P-V Line. However, the less favorable trend is not expected to be reflected in business developments for at least three or four months, says Dr. Haney.—Page 1376.

* * *

Prosperity of "luxury" industries has been achieved in part at the expense of basic industries, says economist. While prices of basic goods have remained low, the goods and services which have been elaborated out of them have tended to remain high in price.—Page 1350.

* * *

"Happy plant atmosphere" and low costs go hand in hand. Establishment of definite rules of conduct for employees and enforcement of such rules have been found to make for contentment among workers and to have produced remarkable savings.—Page 1364.

* * *

Open-hearth furnaces with inadequate regenerative capacity should be operated on short reversal periods, says open-hearth man. Longer periods can be taken when there is ample checker brick to absorb the heat.—Page 1367.

Higher prices for copper will not necessarily lessen demand, copper man believes. "Sales value of copper . . . is firmly established for many purposes and the purchasing public looks for the metal as an indication of quality." A new consumption record will likely be set in 1928.—Page 1374.

* * *

Appreciable reductions in foundry costs can be made by comparing results. Each superintendent thinks his own costs are lowest obtainable, but, if foundries combine into a cost group, items which are higher than the average will be revealed, and an investigation started to determine the reason.—Page 1363.

* * *

Can Federal Trade Commission enforce rules against violators of trade practice agreements? "Still doubtful," says Commission official. It is still more doubtful how minority members of an industry who refuse to subscribe to agreements can be punished.—Page 1374.

* * *

Exports of iron and steel for first 10 months of 1928 are 12 per cent above same period of 1927, while imports are slightly less. October exports were 50 per cent above last year, and the fourth highest month of the past seven years.—Page 1411.

* * *

Money can be saved for big producers of borings by melting the borings in an electric furnace and turning them into high-grade castings. Borings have low market value and the producer can utilize them most advantageously himself, says foundry engineer.—Page 1359.

If consumption were as generously financed as production is, business would be better, economist states. The belief that production automatically finances consumption is a fallacy. Credit fails to perform its full function when it is confined largely to financing production.—Page 1351.

* * *

Better seamless pipe is made by using two piercers instead of one, pipe maker believes. In all but the smaller sizes of pipe, a primary piercer is used first, to pierce a small hole. This is expanded by passing the piece through the second piercer.—Page 1356.

* * *

No possible way of sustaining capital equities created out of production credit expansion, without a corresponding expansion of consumer purchasing power, says economist. Wages may have to undergo a further inflation, without a rise in commodity prices, to bring this about.—Page 1352.

* * *

Stabilizes foundry business by adopting cost group plan. Ridiculous variations in bids have been eliminated by standardized cost system. Guesswork has been avoided and competition has been put on a fair, sound basis.—Page 1363.

* * *

Regulation of competition is dangerous and fallacious, says National Industrial Conference Board economist. Restriction of production involves a restriction of consumer purchasing power, and protected returns to capital invite over-investment and increased competition.—Page 1351.

ESTABLISHED 1855

The Next Forward Move in Steel

AS a cross-section of the cooperative effort that is now the uppermost thing in American industry, a single recent issue of *THE IRON AGE*—that of Nov. 15—was an arresting exhibit. The issue was not planned to center on that subject, but events in the great field covered by this journal conspired to make group action by manufacturers the feature of the week.

A leading place was given to a report of the early proceedings of the Biloxi meeting of the American Institute of Steel Construction, whose executive director, Charles F. Abbott, has done a man's job in propagating a more enlightened selling practice in steel fabrication. Able as were other papers on the Biloxi list, the one which the steel industry most needs just now to digest for its health's sake was given by Charles H. Macdonald, recently head of the market research department of the Colorado Fuel & Iron Co., and now its director of sales. (In passing, we predict that five years hence managers of market research departments will rank higher in the lists of steel company executives than they do today—and they will be much more numerous.) It is not because his preachment is one that *THE IRON AGE* has long urged upon the industry that we specially cite Mr. Macdonald's paper, but because, with all their well-recognized triumphs, the manufacturers of steel now need most of all to move together to get for their products a larger place in popular thought and in every-day life. With no attempt to recapitulate the address, which we have already printed in full, we repeat three or four of its suggestions for better marketing through group action, such as the cement, lumber, brick and other industries have taken with good success:

The public should be educated, through a well planned national campaign of publicity, to the value of steel and its greater use in all requirements large and small.

More effort and money should be devoted to neglected markets for the established and logical use of steel.

A fund should be created for the development of new uses of steel.

We should be in position to offer through an organized bureau, to any industry using or contemplating the use of steel, all the facilities of the entire steel industry for the more rapid and satisfactory development of any practical new product, instead of leaving the customer or some individual steel manufacturer to work out, at an undue expenditure of time and money, products which ultimately bring business to the entire industry.

More attention and study should be given to the problems of individual fabricators and users of structural steel and steel products of every kind.

Also at the Biloxi meeting President W. M. Wood of the institute viewed the situation much as Mr. Macdonald saw it, saying that "in the vital problems of sales and distribution and publicity the industry as a

whole has seemed to be where it was a generation ago, and until recently this fact seems to have been no cause for concern." And F. H. Frankland, who is in charge of the technical service of the institute, declared that the public has not been "sold" on steel, and that it is essential that a "steel consciousness" be inculcated in the minds of the architect, the engineer and the builder through a comprehensive national advertising campaign.

On another page of the Nov. 15 issue the reader learns that 36 representatives of associations in the machinery and equipment industries met at Washington and planned for a series of conferences which will work for the abolition of unfair trade practices. In an adjoining column, E. W. McCullough of the department of manufacture, Chamber of Commerce of the United States, is reported as telling a meeting of manufacturers how by group action whole industries are competing with each other for the supplying of the same demand through different media. On the following page it is told that by cooperating in simplification manufacturers of eaves trough and conductor pipe are now making 94 per cent of the country's output in conformity with the simplified schedule; and the next column reports recent progress in the standardization of small tools and machine tool elements by a committee of the National Machine Tool Builders' Association and two engineering societies.

As a final citation, there is an extended extract from the address of Charles M. Schwab at the "Pioneers of American Industry" dinner in New York, in which he emphasized organization and cooperation as forces in industry, referred to the organization of research on a great scale by manufacturers, and predicted that future pioneering would be by great groups of trained men using each other's scientific knowledge, rather than by individuals as heretofore.

The steel industry is no stranger to cooperation. Judge Gary made the word almost synonymous with his own name. But cooperation in finding new outlets for its products and developing the old, in putting steel in a larger and more rapidly growing place in our twentieth century economy—that is the work to which steel manufacturers are now called by what is happening both in their own industry and in those whose progress depends on its enterprise and vision.

Automobile Prosperity

IT is true that the steel industry is prosperous, but the automobile industry is more so. Comparisons of earnings are frequently made, unfavorable to the former. The difference in conditions is not to be found in the increase in demand or in the demand relative to productive capacity.

As to production, both steel and automobiles made new high records in 1926, then having an off period in 1927. This year the gains over 1926 are not very dissimilar. Production of passenger cars and trucks in the United States and Canada in ten months totaled 4,090,197, of which October accounted for 417,354. A careful estimate allowing for rising Ford production, the present lull in Chevrolet production and seasonal influence with other makers puts the total for 1928 at about 4,800,000, which is 6½ per cent over 1926 and, incidentally, 34 per cent over 1927. This year's steel production gains over 1926 by about 6 per cent, which is much the same thing. No little of the steel industry's prosperity has been due to its automotive trade customer, as the demand came with quite a rush and, cars being made decidedly heavier than in 1926, it called for a substantial gain in tonnage. As we have recently noted, the proportion of the year's steel going into automobile and truck manufacture may easily be 17 per cent, against 14½ per cent in 1926 as shown by THE IRON AGE finding at the end of the year.

On account of Ford being largely out of production in this year, taken as a whole, comparison between production and capacity for 1928 cannot fairly be made. Capacity for 1929 may be put at 7,000,000 cars and trucks, United States and Canada. This figure seems to be reasonably low, based on Ford and Chevrolet estimates and consideration of what other builders did in August, the record high month. A prediction has been made of 6,000,000 production in 1929, which seems altogether rosy, and 5,000,000 is not by any means guaranteed. The latter total would be only a trifle over 70 per cent of capacity, whereas this year's steel production is about 84 per cent of capacity. Thus the comparison of earnings with the ratio of production to capacity makes a curious showing. If it be said that automobiles are more seasonable than steel and thus cannot show as high a percentage of production to annual capacity, it may be rejoined that steel producers have been less resigned to taking their off seasons as they come than the automobile producers have been.

One cannot doubt, however, that the automotive industry is going to have some interesting developments next year as to some producers thriving more than others. A light production works havoc with the individual producer's costs, and the annual turnover relative to assets is so large that price reductions sufficient to turn a poor seller into a good seller are scarcely conceivable.

The combined automobile production of last year and this is about 6 per cent below the combined production of 1925 and 1926, which were both good years. It is on that ground, presumably, that statements have been made that 1929 will be entered with a sort of "deficit" of nearly a million cars. The iron and steel trade had too much experience years ago with computations of alleged deficits in pig iron production to count upon any so-called "deficit" being made up unless conditions are favorable, and when they are sufficiently favorable people will buy even if there is no deficit. If the peak of domestic demand was temporarily passed a couple of years ago, as is quite possible, the growth of exports so frequently mentioned can hardly come in soon enough to bring about substantial increase in total production, for car and truck exports were 305,420 in 1926 and 384,199 in 1927, while 500,000 is an outside

estimate for this year. Increments in future at a greater rate would be remarkable.

Coal Stays in Poor Shape

SUBSTANTIALLY the same stocks of bituminous coal were in consumers' hands Oct. 1 as July 1—the Bureau of Mines reports 41,100,000 tons against 41,700,000 tons. It is normal for stocks to increase during that three-month period. There were reports of coal stocks on these two dates in 1923 and 1926, showing increases of 14,000,000 tons and 4,000,000 tons respectively. One might be disposed to interpret the failure of consumers to accumulate stocks this year as an indication that coal trade conditions will improve. But coal buyers watch the coal situation very closely and their failure to increase stocks seems to indicate they feel assured that next winter coal will be as cheap as ever and as easy to buy. The stocks now reported, it will be understood, are really inconsequential. Since the depletion by the 1922 strike the lowest stocks ever reported were 36,000,000 tons, for May 1, 1926. Approximately that amount is considered an irreducible minimum.

The analysis of coal consumption does not give favorable indication for the future of demand. Weekly consumption during the third quarter of this year was 8,246,000 tons, which is a trifle less than in the same period of 1927 and 9 per cent less than in the period of 1926. Yet we are assured by an imposing array of statistics that industrial activity has been much greater than a year ago and somewhat greater than two years ago. It is plain that year by year coal is being utilized much more efficiently. This fact and the growth of substitutes, both for heat and power, give little promise of increasing tonnage in the future.

It is now several years since "the coal problem" became pressing. Government aid was talked of, but while Congress was willing to spend a large sum of money for information by way of "the fact finding commission," it was unwilling to spend time on the report or on contriving a measure of relief.

It was said, with seeming reason, that if the Government did not help, the coal industry eventually would get some relief by economic forces, by the painful process of elimination, for there were "too many mines and too many miners." A good bit of time has passed and something should have happened, but it has not. Perversely enough coal companies have failed to fail. Had they done so, their mines would still be there, although subject to deterioration; but as it is they have kept up their properties. Of late various idle operators have considered starting up, thinking they might lose less in operation than the cost of upkeep when idle.

We have the production figures year by year of mines arranged in groups according to capacity, and these show no definite drift of production from small to large mines. The smaller mines maintain their relationship. Experts are not surprised by these statistics, remarking that of course many small mines survive because they have lower overhead per ton.

The coal industry is not making profits. Districts formerly union find no difficulty about labor supply. Apparently their trouble is the competition of Southern fields, with considerably lower wages, but the operators in the latter are not making profits either. Several

years have now elapsed with no substantial progress toward a righting of the coal situation. Talk is renewed of the need of Congress doing something, but with little reason to hope that the something really will be done.

The Trade Commission and Business

THE new relation that the Federal Trade Commission is assuming toward business is commanding widespread attention. The point of view of that Government body was set forth by Commissioner Myers in an address published in *THE IRON AGE* last week. It is amplified this week in an interview with the commission's director of trade practice conference, M. Markham Flannery. The point is made that the members of an industry are as entitled to fair competition as the public, in whose interests the Federal Trade Commission law was enacted. Protection of competitor against competitor, according to this view, is in no way inconsistent with the commission's primary obligation to those who buy the products of an industry.

The excellent work that trade associations have done in raising the standards of products and business conduct cannot be fully effective, it is argued, without Government aid. So long as a recalcitrant minority refuses to cooperate, the efforts of the majority are impeded. The commission sees no obstacles to its acting against a minority for practices illegal per se, but whether it can enforce rules adopted by an industry that are aimed at methods not yet held unlawful is a question that the courts have not yet passed on.

So far trade association rules have been focused on

maintaining fair play in competition. To invite the Government to enforce such regulations, no matter how desirable they may be, is a matter of policy calling for careful analysis and unhurried judgment. In the opinion of Virgil Jordan of the National Industrial Conference Board, as expressed in an address before the National Founders Association published in this issue, Government intervention in business inevitably leads to extremes in bureaucratic control. He assumes, however, that trade association activity is headed toward regulation of prices and production. It may indeed be a fact that such group action, once proved effective, would not stop with the mere stamping out of competitive excesses. In such a case it is easy to conceive of Government control taking the course that he predicts.

When Mr. Jordan condemns regulation of competition on the ground that it would stabilize profits and thereby lead to over-investment and restriction of consumer purchasing power, he opposes the view held by most industrialists. A primary aim of efforts to wipe out unfair competition is to eliminate some of the most serious causes of waste in production. Every step toward greater economy is a move toward cheaper output and wider consumption.

Consumption can best be brought into balance with production, according to the Conference Board speaker, by a better banking policy, but he admits that no prompt improvement in that direction is in prospect. Nevertheless his warning against the extension of Government control of business deserves as careful consideration as the presentation of the Trade Commission's position. It is only through a threshing out of this question that industry can intelligently decide its policy.

CORRESPONDENCE

Terms Cash Discounts as Graft

To the Editor: After 40 years' experience in business I am of the opinion that cash discounts are in the same class with tips, bribes and other kinds of graft that are levied for inadequate consideration. That is really what is wrong with them. Tipping may be a kindly act, but when it is exacted mechanically for a trifling service, or for none at all, it is graft.

There was a reasonable basis for cash discount in the days when trade credits ran to 4 or 6 months, with open accounts, and no way of exerting pressure on the debtor except by dunning him. It was worth 5 per cent to get the money in 30 days as compared with an indefinite credit that might run into a year. But even then goods had to be marked to stand it, and if margins were not greater, expenses were less.

When I began work as an office boy in an old-fashioned wholesale house, the usual terms were 5 per cent in 30 days or 4 months net. It meant that 5 per cent was paid for three months' time, and when I remarked to the bookkeeper that it was equal to 20 per cent per annum, he told me to keep my opinions until they were asked for! I mention this because the same kind of reaction still persists. Executives refuse to consider a fact of percentage if it does not fit in with preconceived ideas. Sometimes I wonder what proportion of business men really understand the term "per cent."

No doubt the principle of cash discount is as old as commerce—that is, the buyer who goes to market with money

in his purse expects to do better than the buyer who must ask for credit, or who accepts a term of credit because it is customary. But this falls down when competition and trade use compel the figuring of prices on a cash basis. In primary markets prices are quoted for cash. Go into the country with a cattle buyer who is picking up a carload of steers. There will be bargaining, but once the cattle are delivered as agreed the buyer pulls out a fat wallet and pays in currency. If very well known, he may be able to pay by check, but he must not expect to do this when buying from a stranger. Cash is cash, and no nonsense about it. Imagine the seller being asked for a "cash" discount.

Now it may be said generally that raw materials are sold for cash, and sometimes the rule is enforced strictly—cash against delivery or against documents; or what our Quebec friends call "argent comptant"—a very expressive phrase which means "money counted out." But the inconvenience of this has brought into use a limited term of credit, usually 30 days, which is elbow room in terms of time. It is enough to permit the work of billing to be done accurately as goods are shipped, to allow for transit over a considerable radius, and for eventual delivery to the buyer, who is presumed to be doing business in an orderly manner, which means that incoming goods are checked and inspected and the account certified for payment. Then, in due course, it will be paid—and there ought not to be any necessity for bribery to get it paid. To say that a discount of 2 per cent is "earned" by payment in 10 days instead of thirty days is nonsense. It is not earned, it is graft!

No argument about including the 2 per cent in the cost of goods gets over the fact that 2 per cent for 20 days is at the rate of 36.5 per cent per annum. Now if call money touched 36 per cent for even a day, Wall Street would

have a panic and the Exchange would close for a week to cool the hot bearings. It has been much advertised that surplus working capital of corporations has lately been employed as call money, and it looks like good business to make it earn 6 or 7 per cent. But not much imagination is required to visualize a corporation lending money on call which is in part obtained from customers who are taking a discount of 2 per cent for 10 days. And grave execu-

tives are knitting their brows over zigzags to find out what is wrong with business. They might ask the office boy, or, if that species is extinct, perhaps the bookkeeper might be consulted. A man who stands at a desk working at figures all day has no time for illusions about the facts of percentage.

Waste Elimination Week Brings Results

Steel Corporation Gets Wealth of Suggestions, Many Considered Worthy of Cash Awards, in Contest

WASTE elimination week, which was conducted in all plants of the United States Steel Corporation Oct. 15 to 20, gave impressive results, which, as time goes on, should result in substantial savings in production costs. The general response from employees may be realized from the fact that in one group of plants of the American Steel & Wire Co., those of the Worcester district, there were almost as many suggestions from employees as there were men employed. The number of men was 4700 and the number of suggestions was 4424. Fully one-half of these are considered useful and more than 100 of them have been recommended for consideration for financial award.

In this campaign waste was construed to mean anything which, in the final analysis, causes a loss in dollars and cents. It might be the useless expenditure of time, energy, money, materials; of water, steam, light, heat; of human life or limb.

The Worcester district has been conducting for two years a suggestion system regarding waste elimination, in which employees are urged to cooperate by contributing ideas. In the six days of intensive waste elimination week more suggestions were received than in the two years of the continuous system.

The first step was the general announcement to employees of the works that the campaign would be carried through, everyone being urged to cooperate, and that cash awards would be made for novel and outstanding suggestions. The superintendents and foremen were called together by the assistant district manager, who outlined the plan and what it was proposed to do in stimulating interest among the workers. The foremen in turn addressed their men and aroused their interest.

Of the 4424 suggestions received, 3 per cent were considered worthy of cash awards, in the opinion of the local management, and this recommendation was forwarded to headquarters. This percentage has been the common experience in industries which have conducted similar campaigns. But the accrued benefits to the business were by no means confined to the suggestions of the 100 whose ideas were of novel and outstanding value. Others, less distinctive, are useful to the management.

Many of these called attention to lapses in practice, where the human factor has permitted prescribed methods and regulations gradually to become ineffective.

Most of the more important suggestions may be divided into two classes, practice and equipment. Elimination of processes or the combining of processes received sound, practical attention. The most economical use of materials came in for important consideration, particularly in pointing out that as good or better results in certain cases could be obtained by using a different kind or grade of material. There were other important suggestions concerning the elimination of scrap, always a real problem in the wire industry. Another vital subject of suggestion was that of changes in equipment to make more efficient. Accident prevention and working conditions, such as light and sanitation, came in for a limited amount of comment, but the years of concentrated attention which the Steel Corporation has given to this branch of management has made this field of suggestion a lean one.

Taylor Society to Meet Dec. 5 to 7

The annual meeting of the Taylor Society will be held at Rumford Hall, 50 East Forty-first Street, New York, Dec. 5 to 7 inclusive. On Friday afternoon a visit to the plant of the Sperry Gyroscope Co. in Brooklyn has been arranged for production executives and a meeting of teachers of management has been planned for Dec. 8. The tentative program for the convention includes the following papers:

"Variations in the Applications of Engineering Technique to Management As Illustrated by Variable, Intermittent and Continuous Processing," by G. E. Schulz, Armstrong Cork Co., Lancaster, Pa.

"The Marketing Problems of a Manufacturer of Resale Goods," by Willard E. Freeland, Freeland & Warren, Boston.

"Some Basic Principles of Cost Accounting," by John H. Williams, industrial engineer, New York.

"Some Observations on Workers' Organizations," by Morris L. Cooke, consulting management engineer and president Taylor Society.

"How Scientific Management Can Promote a New Functional Status for Workers," by Geoffrey C. Brown, consulting engineer, East Orange, N. J.

"Suggestions Concerning a More Com-

prehensive Approach to the Problem of the Shorter Work Day and the Shorter Work Week," by Dr. H. S. Person, managing director Taylor Society.

Cleveland Company Goes Into Receivership

The Variety Iron & Steel Co., Cleveland, has been placed in the hands of a receiver on application of the Cleveland Trust Co. Albert R. Manning, an attorney, is the receiver. The bank in its petition stated that the company's assets far exceeded its liabilities and that it is solvent provided assets are properly protected. The Variety company is a fabricator of heavy plate work, blast furnace work and structural steel work.

Republic's New Financing— Directors Added

The Republic Iron & Steel Co., Youngstown, has announced financing plans to provide funds for expanding the company's plants and its business. The company will offer for sale 100,000 shares of new common stock at \$65 per share, and proceeds will be employed for electrification of the Youngstown properties, probable additions to the Birmingham plant, and further exploitation of the tube welding process acquired through purchase of Steel & Tubes, Inc. Stockholders of record of Dec. 15 are entitled to subscribe for one share of the new stock for each six shares now owned. Stock unsubscribed for will be taken over by a banking syndicate. The stock must be paid for by Jan. 3, 1929.

The company has increased its board of directors from 11 to 14 by the election of Philip Wick, Youngstown, and William G. Mather and Myron Wick, Cleveland. Philip Wick was formerly vice-president and a director of the Trumbull Steel Co., now a part of the Republic company, and Myron Wick has been active in Steel & Tubes management. Of Republic's 14 directors, six are from Cleveland, five from Youngstown, two from Pittsburgh, representing the Mellon group, and one, John A. Topping, chairman of the board, from New York.

A motion picture film showing arc welding applied to erecting the structural steel for the Upper Carnegie Building, Cleveland, may be obtained gratis on application to the Lincoln Electric Co., Cleveland.

Iron and Steel Markets

Steel Prices Have Easier Tone

Bar Quotations for Current Quarter Continued for Next

Quarter—Concessions in Hot Strip—

Decline in Production Halted

STEEL prices are easier, but the decline in production has been checked. With the general trend of specifications downward as the year-end approaches, releases by the automobile industry continue to act as an offsetting influence. Construction work and railroad cars are also taking more steel.

Among the primary materials, pig iron still shows strength in the Central West and South, but is less buoyant in the East. Heavy melting scrap at Pittsburgh, after declining for four consecutive weeks, has undergone no further change in the past seven days, and a somewhat steadier price situation obtains in other market centers. Prompt furnace coke at Connellsville has receded 10c. a ton and is now 15c. below the peak reached in the middle of October.

Steel bar prices reflect a marked change in the condition of mill backlogs. Buyers no longer find it necessary to pay premiums for early shipments, and the market is again quotable at 1.90c. to 2c., Pittsburgh, compared with 1.95c. to 2c. when the advantage was with the mills. The possibility of an advance for first quarter has also passed, with the opening of books by two producers at the same prices that rule on current contracts. Cold-finished bar prices likewise have been continued for the next quarter, and similar action is expected on plates and structural shapes.

Large buyers of hot-rolled strip have succeeded in placing first quarter contracts at concessions of \$2 a ton. This product, however, under the new bases and extras recently announced, had been advanced \$3 to \$5 a ton over current invoice prices.

In contrast, sheet prices for first quarter have held in contracts placed thus far, although mills continue to make sales for immediate specification at \$2 a ton less.

Territorially also a mixed situation is indicated, with an advance of \$2 a ton on plates, shapes and bars reported from Birmingham.

Steel output shows little change. The rate for the Greater Pittsburgh district remains at 80 per cent, while Chicago continues on an 82 per cent basis. The average for Steel Corporation subsidiaries has risen to about 82 per cent, compared with a recent rate of 80 per cent.

The recovery in steel specifications from the automobile industry, noted at Cleveland a week ago, has continued and additional first quarter contracts have been placed. The increased steel requirements are to a large extent for new models to be brought out Jan. 1.

Large projects are sustaining the demand for steel in the construction field. For a third week structural steel contracts have been heavy, the current total being 58,600 tons. Of this amount, one contract—for a bridge

between Staten Island and New Jersey—calls for 26,500 tons. A New Jersey pipe line, on which bids will be closed Dec. 6, will require 38,000 tons of plates.

Indicative of the growing steel requirements for ships is an inquiry from a New Jersey builder for prices on 12,000 tons of ship plates and 4000 tons of shapes.

Railroad equipment buying for the week included a total of 2900 freight cars, of which the Wabash bought 2000 and the Chicago & North Western 700. Among new inquiries for more than 4000 cars were 2500 for the Louisville & Nashville, 1025 for the Santa Fe and 250 for the Rock Island.

The current rail buying movement is half over, judged by the tonnage booked by Chicago mills. The Ensley, Ala., mill, which resumed operations Nov. 24, has received an order for 13,000 tons from the Southern Pacific.

Tin plate specifications have increased, following the announcement of the price for the first half of 1929, and mill operations now average 80 per cent, compared with 70 per cent a month ago.

Cleveland reported another good week in sales of foundry and malleable pig iron, which totaled 46,000 tons, and one producer in that city is booked full for the first quarter. Bookings at Cincinnati aggregated 31,000 tons. Extra demands of melters have enabled Valley iron to penetrate as far west as South Bend, Ind., resulting in a 50c. advance in Valley foundry grade to \$18, furnace. Virginia foundry iron, following the lead of Birmingham iron, has gone up 25c. a ton to \$20.25, base furnace. Sales at the new price of \$16.50, Birmingham, have encouraged one Alabama furnace to raise its quotation another 50c. a ton.

A less favorable situation exists along the Atlantic seaboard where the last advances announced by Buffalo and Eastern furnaces are no longer generally adhered to.

The increase in silvery pig iron and Bessemer ferro-silicon by Jackson County makers was not uniform, as reported last week, since one producer marked up quotations only \$1 a ton compared with \$2 by the other.

Machine tool buying is heavy, outstanding orders including two of more than \$300,000 each from domestic buyers and a third of \$100,000 from Sweden.

Machinery exports for the 10 months ended with October established a new record and were larger than for any entire year between 1921 and 1927.

The 10 months' exports for iron and steel, excluding scrap, were the largest since 1921.

THE IRON AGE composite price for pig iron has advanced from \$18.54 to \$18.59 a ton. The finished steel composite has declined from 2.369c. to 2.362c. a lb.

Pittsburgh

Bars, Plates and Shapes May Not Be Advanced for First Quarter—Foundry Pig Iron Higher

PITTSBURGH, Nov. 27.—Developments in steel prices engage attention this week. Some makers of steel bars have announced a continuance of this quarter's price on first quarter contracts, and it now appears that no attempt will be made to advance prices on bars, plates or shapes. These lines have had a total advance since a year ago of from \$3 to \$4 a ton over the invoice prices then current, and in this respect bars, plates and shapes have outstripped most other finished steel products.

Hot-rolled strips, with the assistance of a new card of extras, are quoted well up as compared with where they have been much of the time during this year, but late advances suggest that with the opening of negotiations for large tonnages it has been necessary for producers to modify their price ideas.

Makers of cold-finished steel bars are continuing the present price on first quarter contracts. There had been some suggestions of an advance, but failure of the price of hot-rolled bars to move to higher ground removed an important prop. Nothing has developed in connection with first quarter wire and nail prices; an advance may come, but whether it will

be through an out and out raising of prices or through a recasting of sales methods is not yet clearly defined.

Strong demands for foundry iron from consuming points not recently supplied by Valley furnaces, on account of unfavorable freight rates, have stiffened the price to \$18 for the base grade in spite of rather limited demands from Pittsburgh and other points that constitute the usual market for Valley iron.

No marked recession has come in steel works and rolling mill engagement in this and nearby districts, but the operating activity is due chiefly to the momentum of the October rush, since in almost all products there has been a substantial let-

down this month in new orders and specifications. The approach of the end of the year has intensified the desire of consumers for light inventories, and some restriction of demand, furthermore, is common to this time of the year when consumption usually is on a declining scale. November has been light in new tonnage releases compared with October. Although there has been a drop of 10 points in ingot production, it is believed that unfilled obligations have decreased.

Pig Iron.—Valley pig iron still is showing more activity for shipment westward than toward or into the Pittsburgh district. Most of the recent sales of foundry iron have been to melters in Ohio, while several sales of foundry and malleable are reported for shipment to Indiana points. A Valley merchant furnace, which will be blown in about Dec. 15, will start with a backlog of approximately 10,000 tons of basic iron and about 15,000 tons of foundry and malleable; the basic iron is understood to be for an eastern Ohio steel plant, and of the other grades only a few small lots are to be shipped into this district. The Pittsburgh district

proper has contributed only a small part of the total bookings of Valley furnaces over the past few months. None of the Valley producers, however, lacks a backlog, and while business lately has been a little slow, there is a common tendency to ascribe this condition to the close proximity of the end of the year and the desire of melters to keep down inventories. So long as foundries which serve the motor car industry keep as busy as they are at present and their regular sources of supply cannot meet their requirements, there is sure to be a demand upon the Valley furnaces, which, until freight rates intervened, supplied many of the points to which they now are shipping. This demand has stiffened the Valley foundry iron price to \$18 for the base grade. Only a little has been sold into Pittsburgh at that price, but it is so readily obtainable elsewhere that producers are indisposed to sell here for less. No fresh business of consequence has developed in basic iron, and sales of malleable and Bessemer iron have been chiefly in small lots. The Carnegie Steel Co. recently took off one of its Duquesne furnaces.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50 to \$18.00
Bessemer	18.25 to 18.50
Gray forge	17.50
No. 2 foundry	18.00
No. 3 foundry	17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Not much variation is noted in the rate of specifications on contracts for billets, slabs and sheet bars, although in the past week or so there has been a recession in sheet and strip mill operations. Negotiations for first quarter tonnages are yet to get actively under way; non-integrated sheet makers await developments on the higher price schedule announced a few weeks ago. Strip makers are asking higher prices for first quarter than they are netting on fourth quarter contracts, but the open market price of billets and slabs has been left at \$33, Pittsburgh or Youngstown, for the base dimensions. That, however, would mean higher net prices in the event that makers fully apply the chemical

extras, which most of them announced last August and September. Wire rods are firmly held at \$42, base Pittsburgh or Cleveland.

Bars, Plates and Shapes.—While formal announcements as to first quarter contract prices have not been made by the larger producers, the common belief is that the prices for this quarter will be continued. Some makers of bars have indicated a willingness to take first quarter business at 1.90c. to 2c., base Pittsburgh, and this willingness has taken the form of instructions to salesmen by at least one maker. As most makers now are pretty well caught up with orders and can make prompt deliveries, buyers requiring early shipments find it unnecessary to pay service premiums. The market, accordingly, is again quotable at from 1.90c. to 2c., base, against 1.95c. to 2c., when the advantage was with the mills. Structural steel lettings in this area remain rather small in the aggregate and individual jobs commonly are for small tonnages.

Rails and Track Accessories.—Interest centers in the distribution by the New York Central Lines of the spikes, tie plates and track bolts to go along with the rails recently ordered. Bids closed today (Nov. 27) on these track supplies. Business otherwise is slow.

Wire Products.—Business compares favorably with that at this time last year. Frequent suggestions of price advances are believed to lend some stimulation to specifications at a time when consumption usually is light and distributors are trying to reduce their inventories. No formal announcement has been made as to first quarter nail and wire prices.

Tubular Goods.—Pipe business does not vary much in volume or as to distribution. Butt welded pipe sales show some seasonal contraction, as requirements for gas, water and heating usually fall off at this time of year. There is a fairly steady demand for oil country pipe, in which seamless pipe is figuring to a greater extent than ever before. In backlog business the mills are better off in line pipe than in other classes. Demand for boiler

tubes is fairly active. Mechanical tubing, although not as active as it was recently, is doing well.

Sheets.—The close proximity of the end of the year, with its inventory-taking, is beginning to be reflected in sheet orders and specifications. Some of the motor car builders are seeking to defer deliveries on existing contracts until late next month or the first of January and other consuming industries appear less anxious for shipments. It is said that on first quarter tonnages no resistance to the new prices worthy of notice has been encountered, but it is a little early for a real test of the market. Former prices still rule on tonnage for shipment over the remainder of the year on either contracts or fresh purchases. The market lacks real strength in galvanized sheets, but Monday's advance in the price of spelter may possibly exert a steadying influence on prices.

Tin Plate.—With the price for the first half of next year settled, more tonnage is reaching producers. Mill operations, which a month ago were down to about 70 per cent, now are up to approximately 80 per cent, with the outlook for a further gain as the year draws to a close.

Cold-Finished Steel Bars and Shafting.—Fairly good movement on contracts is noted, but new business is light and buyers are showing no great interest in first quarter requirements. Prices for that period have not been named, but as the price of hot-rolled bars is likely to remain where it is, the common expectation is that there will be no change on cold-finished bars.

Hot - Rolled Flats.—Makers of strip are formally announcing 1.90c., base Pittsburgh, as the first quarter price on strips wider than 6 in. to and including 24 in., and 2c., base, for widths of less than 6 in. Not much business for that period yet has been concluded. Current demands are somewhat smaller than they were recently, owing to the contraction in the general requirements of motor car builders.

Cold-Rolled Strips.—Demands are lighter, but still are well in excess of those at this time last year. Makers

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

are firm at 2.85c., base Pittsburgh, on new business and also for first quarter contracts. Buyers whose requirements run to small lots and whose specifications are exacting are asked to pay 2.95c., base.

Cold-Finished Steel Bars and Shafting.—Leading makers have opened books for first quarter contracts at 2.20c., base Pittsburgh or Chicago, and 2.25c., base Cleveland, reaffirming the present quarter's price. It has become apparent in the past few days that there will be no change in the first quarter contract price of hot-rolled bars. March 15 has been named as the closing date for specifications on first quarter contracts. Current demands are moderate, but a steady movement on fourth quarter contracts is reported.

Hot-Rolled Flats.—The market on strips has become somewhat unsettled by reports of concessions to tonnage buyers on first quarter contracts. Several large contracts with motor car builders are under negotiation and are reported to have brought out concessions of as much as \$2 a ton from the prices named by makers in formally opening their books a few days ago. In these announcements widths up to 6 in. were quoted at 2c., base Pittsburgh, and for 6 in. to and including 24 in., 1.90c., base. Business in strips lately has been dwindling and the price shading is probably the result of the desire for orders, and it is probable also that producers encountered some difficulty in convincing large buyers that they should pay \$3 to \$5 a ton above present invoice prices.

Coke and Coal.—The market is weaker on spot furnace coke, and sales at more than \$2.75 per net ton at ovens have been out of the question lately. Production has not declined as rapidly as the demand for spot tonnages, and the answer is in the lower price. Producers, however, look for improvement next month,

counting on the starting of three blast furnaces to take up the slack, while heating and domestic demands are expected also to provide an outlet for some good-sized lots of Connells-ville coke. Spot foundry coke is going rather slowly, as consumers are disposed to keep their stocks within bounds for the year-end inventories. Some 72-hr. coke is available at \$3.50, but more commonly \$3.75 is the minimum on good brands. The coal market is very weak. With less sized coal now required as the lake shipping season ends, supplies of slack are expected to grow smaller and prices to stiffen.

Old Material.—Nothing has occurred to change scrap iron and steel prices this week. Steel makers are not much interested in fresh supplies, but they are insisting on deliveries on old orders and this creates a dealer demand that is sufficient to keep the market fairly firm. It is still said that heavy melting steel cannot be sold to consumers at over \$17, but also that dealer bids of less do not bring out much material. Steel works operations are off about 10 points from the recent peak; a desire to keep down inventories is another reason for light mill purchasing. Foundry grades are dull. Blast furnace scrap is firm owing to light offerings and more remunerative prices west of this district. The December scrap list of the Baltimore & Ohio Railroad contains 13,910 gross tons, including 6000 tons of No. 1 rails and 2200 tons of No. 1 heavy melting steel.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$17.00
Scrap rails	17.00
Compressed sheet steel.....	17.00
Bundled sheets, sides and ends	\$15.50 to 16.00
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary..	17.00 to 17.50
Heavy breakable cast.....	13.50 to 14.00
No. 2 railroad wrought....	17.00
Hvy. steel axle turnings....	15.00
Machine shop turnings....	10.50 to 11.00

Acid Open-Hearth Grades:

Railr. knuckles and couplers	18.50 to 19.00
Railr. coil and leaf springs	18.50 to 19.00
Rolled steel wheels.....	18.50 to 19.00
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates.....	19.00 to 19.50
Low phos., light grade.....	18.00 to 18.50
Low phos., sheet bar crops	19.00 to 19.50
Heavy steel axle turnings..	15.00

Electric Furnace Grades:

Low phos. punchings.....	18.50 to 19.00
Hvy. steel axle turnings..	15.00

Blast Furnace Grades:

Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings.....	12.00 to 12.50
No. 2 bushelling.....	9.50 to 10.00

Rolling Mill Grades:

Steel car axles.....	20.00 to 21.00
No. 1 railroad wrought....	13.00 to 13.50
Sheet bar crops.....	18.00 to 18.50

Cupola Grades:

No. 1 cast.....	14.50 to 15.00
Rails 3 ft. and under.....	17.50 to 18.00

The Danville Structural Steel Co., Inc., Danville, Pa., maker of steel tubing, angles, channels, special shapes, reinforcing bars, fence posts, etc., has removed its New York office to 11 West Forty-second Street.

Heavy Orders for Steel Furniture

WASHINGTON, Nov. 27.—Increasing \$495,091, orders for steel furniture stock goods in the "business group" were valued at \$3,184,100 in October, against \$2,689,009 in September, according to reports received by the Department of Commerce from 34 producers. This was the largest total since last March and the fourth largest ever recorded. Shipments were valued at \$3,155,353, compared with \$2,754,135, while unfilled orders were valued at \$2,089,956 and \$2,061,856 respectively. Orders in this group for the 10 months ended with October were valued at \$29,678,981, compared with \$25,433,799 for the corresponding period of last year, while shipments were valued at \$29,068,316, against \$25,509,006.

Orders for shelving furniture in October were valued at \$958,736, an increase of \$159,876 over those received during September, according to reports received from 16 companies. This made the largest total on record. Shipments were valued at \$953,804, against \$678,422, and unfilled orders were valued at \$760,104, compared with \$753,813. For the 10 months ended with October orders were valued at \$7,897,123, against \$6,157,083 for the corresponding period of last year while shipments were valued at \$7,590,062 and \$6,095,608 respectively.

New England Activity

The output of forged automobile crankshafts by the Wyman-Gordon Co., Worcester, Mass., this year will exceed that of 1927, and will establish a new high record.

The Moore Drop Forge Co., Springfield, Mass., the largest independent New England drop forge plant, is operating at 100 per cent of capacity on Ford automobile parts.

The New London Ship & Engine Co., New London, Conn., has been awarded a contract for two ferryboats by the State of New York. The boats will operate between New York and Wards Island, and are scheduled to be completed in July, 1929.

Grover Lassen, Hartford, Conn., has agreed to pay the indebtedness of the H. D. Smith Drop Forging Co., South- ington, Conn., manufacturer of hand tools. The plant was closed last January with \$45,000 in bills outstanding. It is assumed the company will resume operations before the end of the year.

Necessary steps have been taken for the reorganization of Billings & Spencer Co., Hartford, Conn. It has been voted to liquidate the company and to reincorporate as the B. & S. Co. until after Jan. 1, when the corporate name will be as originally. Officers of the new company are: David J. Post, chairman of the board; Frederick C. Billings, president; A. H. Deute, vice-president and general manager; Charles T. Jones, secretary and assistant treasurer.

Hot-pressed nuts, blank or tapped, hexagons		Discounts of 70 per cent off on bolts and nuts applied on carload business. For less than carload orders discounts of 55 to 60 per cent apply.		Milled cap screws	
C.p.c. and t, square or hex. nuts, blank or tapped		Large Rivets		Milled standard set screws, case hardened	
Washers*		(1/2-In. and Larger)		Milled headless set screws, cut thread	
*F.o.b. Chicago, New York and Pittsburgh.		Base per 100 Lb.		Upset hex. head cap screws, U.S.S. thread	
†Bolts with rolled thread up to and including 3/8 in. x 6 in. take 10 per cent lower list prices.		F.o.b. Pittsburgh or Cleveland		Upset hex. cap screws, S.A.E. thread	
		F.o.b. Chicago		Upset set screws	
				Milled studs	

Chicago

Steel Buyers Exercising Greater Caution But Total Tonnage Supports Ingot Output of 82 Per Cent

CHICAGO, Nov. 27.—The railroad equipment market is active and the outlook for building construction is unusually favorable. Both of these factors lend a buoyant tone to the market. However, a condition less to the satisfaction of sellers is the caution shown by users in holding stocks to a minimum. This movement already has affected measurably the character of new business and also specifications.

Announcements of first quarter prices for plates, shapes and bars are being withheld, and purchases, some of which are to piece out last period contracts, are being made at 2c. to 2.10c. per lb., Chicago.

The chief evidence of the caution exercised by buyers is in smaller orders and specifications. These in the aggregate, however, make a fairly good showing and support the present ingot production of 82 per cent of capacity. Releases for steel are at closer range, and an increasing proportion is for the lighter products, so that the percentage of mill equipment engaged is somewhat less of a measure of production. Notwithstanding the moderate but important changes that are taking place in this market, it seems assured that 1928 will establish a record in tonnage shipped.

It is reported that the Chicago & North Western and the Northern Pacific may add 2000 cars each to recent purchases. The New York Central is in the market for large quantities of tie plates and angle bars and 25,000 kegs of spikes.

Pig Iron.—Prices are firm at \$20 a ton, local furnace, except for tonnages of boat iron offered at Milwaukee at \$19.25 a ton, Chicago basis. A Valley furnace has taken 2000 tons at South Bend, Ind., at \$21.70 a ton, delivered. This figures back to \$18, Valley. The delivered price from Chicago is \$22.05. The St. Louis producer expects to light a second stack in a week or 10 days. Books for first quarter are heavier now than they were a month before the opening of the third quarter.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.51
Low phos., sil. 1 to 2, copper free	\$29.00 to 29.50
Silvery, sil. 8 per cent.....	31.79
Bess. ferrosilicon, 14-15 per cent...	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—The feature of this market is the continued activity among purchasers of railroad equipment. In the past week Western car builders have taken orders for about 2500 cars and 1100 underframes, requiring about 40,000 tons of steel. Of special interest is an inquiry for 950 freight cars by the Santa Fe, this being taken as the forerunner of purchases which it is believed in some quarters will approximate 5000 cars. It is early for

mills to feel the effects of recent car business in any great volume, but shipping schedules are being arranged and some specifications already have been issued. Miscellaneous orders for oil storage tank construction total 3000 tons of plates. Chicago mills continue to withhold announcements of the course to be pursued in the matter of first quarter prices. Meanwhile, orders are being taken at 2c. to 2.10c. per lb., and one seller has instructed salesmen to consider future business only at the higher figure.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago

Ferroalloys.—Domestic producers of spiegeleisen are asking \$34 a ton, Hazard, Pa., for the 19 to 21 per cent grade in carloads. This market is quiet, however, and, in their efforts to attract tonnages, sellers have named as a first offer \$31 to large buyers. Contract prices for ferrosilicon are still somewhat unsettled even where small tonnages are involved.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Billets.—Rerolling billets, 4 in. and under 10 in., are moving in fair volume at \$35 a gross ton, Chicago. There is also a fair demand for forging billets, which are priced at \$40 a ton for local delivery. Several large contracts for this commodity have been overspecified, and orders for the remainder of the year are active. Current shipments are running below the rate of October.

Cast Iron Pipe.—This market continues to mark time, with practically all classes of buyers showing no interest in future needs.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$45.20 to \$46.20; 4-in., \$49.20 to \$50.20; Class A and gas pipe, \$4 extra.

Bars.—Soft steel bars remain the most active among finished steel products. Specifications are fully equal to shipments, showing no variation from a week ago. A few consumers are taking interest in first quarter requirements and several inquiries are before the trade, but sellers have not announced first quarter prices. On spot sales, prices tend to strengthen toward the upper level of the 2c. to 2.10c. range. Shipping schedules now

being prepared by automobile manufacturers give promise of an expanding demand in December, but it is generally believed that it will be the middle of January before heavy shipments will be resumed to that industry. Release orders from the agricultural trade are more liberal. Demand for forgings is widespread, but it has swung toward heavier pieces since the curtailment of orders by the automotive industry. Forward contracting in alloy steel bars is active, and producers already have built up sizable books for first quarter. Shipments from local mills represent about 75 per cent of capacity. Consumers of rail steel bars are being offered first quarter contracts at current quotations. Specifications for the week exceed shipments, which have remained steady for several weeks. Liberal specifications and sizable spot purchases are being made by the bed industry and manufacturers of barn equipment. Deliveries range from two to three weeks.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Structural Material.—The prospect of early placing of several sizable contracts is measurably improved. The La Salle Club, Chicago, requiring 6000 tons, has been financed and work of razing old buildings on the site will be under way in a few days. Two old projects, the Fine Arts Building, Chicago, and the First Regiment Armory, have been revived, and fabricators expect plans at an early date. At Milwaukee, the Civil Courts Building, which will take about 9000 tons, is active. Taking of bids on the 15,000 tons needed for the Chicago Board of Trade Building has been postponed until Dec. 12. It is expected that the general contract for the local Naval Armory will be let before the end of the week. Railroad and State highway bridges have contributed the bulk of ordered tonnage this week. The Louisville & Nashville has placed 1300 tons and the Northern Pacific 1150 tons. Highway bridges in Indiana and Michigan account for 1000 tons. The Chicago Tribune is taking preliminary steps to add a 20-story structure to its plant, and a proposed theater and apartment structure may rise 44 stories above Michigan Avenue. Taken as a whole, the structural steel market is unusually active for this time of the year. Sales in November are not on a par with those of October, but they are well ahead of November a year ago. Competition among fabricators remains keen, notwithstanding that order books are well filled and prices remain at the low levels of recent months. With the bulk of steel already ordered against recent contracts, specifications from structural shops are light.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Rails and Track Supplies.—The Missouri-Kansas-Texas is said to have placed its 1929 rail requirements with

two Chicago mills, the Colorado maker and an Eastern mill. Forward contracting with Chicago mills has reached about half of the tonnage expected in the fall buying movement. Track supply purchases total 15,000 tons, of which 10,000 tons was in tie plates for the Missouri Pacific. Fresh inquiry totals 5000 tons. In recent days one producer has rolled billets while the finishing end of the rail mill was undergoing extensive repairs.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—Present quotations on these commodities have been named for first quarter contracting, which will get under way about Dec. 1. Spot buying is dull. Specifications, although somewhat influenced by the approach of the inventory period, are well sustained.

Sheets.—Producers are taking orders for delivery in the first quarter at present quotations. New business is of moderate proportions. Specifications against old contracts are equal to shipments and sustain output at 75 per cent of capacity. Jobbers are enjoying an active trade and are ordering freely. Deliveries range from two to three weeks.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c. to 3.00c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Reinforcing Bars.—A substantial amount of new business has been placed and fresh inquiry is more promising than in many weeks. Inquiries for two junior high schools have been revived and prices are being asked on two new similar projects. It is reported that the General Electric Co.'s warehouse, requiring close to 1600 tons, is to be revived. An apartment on Lake Shore Drive, Chicago, will take about 700 tons. Advances in prices appear to be nearer at hand. Consideration is being given by some sellers to a 2.35c. a lb. minimum on carlot orders of billet steel reinforcing bars out of Chicago warehouses. Rail steel reinforcing bars may be advanced to 2.15c. per lb. In the meantime current prices are low and many quotations at the low levels are in the hands of buyers.

Warehouse Prices, f.o.b. Chicago

Base per Lb.	
Plates and structural shapes.....	3.10c.
Soft steel bars.....	3.00c.
Reinforc'g bars, billet steel.....	2.10c. to 2.50c.
Reinforc'g bars, rail steel.....	1.85c. to 2.40c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons.....	3.60c.
Flats and squares.....	4.10c.

Corn. wire nails, base per keg.....	3.10
Cement c't'd nails, base per keg.....	3.10

cing bars may be advanced to 2.15c. per lb. In the meantime current prices are low and many quotations at the low levels are in the hands of buyers.

Cold-Rolled Strip.—Forward buying remains active at 2.85c. to 2.95c. per lb., Cleveland. Many purchasers, including manufacturers of automobiles, are showing interest in first quarter requirements. Current specifications from most sources are in good volume.

Hot-Rolled Strip.—Western producers have opened first quarter books at the prevailing price, which is 2c. per lb., Chicago, for 6 in. and wider. Users are slow in making forward commitments, but inquiry is in fair volume from a wide circle of consumers. Specifications have fallen measurably in recent weeks.

Wire Products.—Wire mills are carrying lower stocks than is customary at this time of the year and do not now plan to increase production against an anticipated spring demand, preference being given to meeting the spring trade by greater production at that time. Books have not been opened for first quarter. There is some talk of an advance in prices, but conditions point to unchanged quotations for the first quarter. The manufacturing trade in Detroit is quiet, but in other sections of the country it is well sustained. Jobbers in the Southeast are finding business dull, while orders from the Central West, South and Northwest are numerous, but for immediate requirements. After dragging for several weeks, following the announcement of spring terms, there is a decided increase in demand for woven wire fencing and steel fence posts. The nail market is dull and without feature.

Coke.—Only moderate interest is being shown by users in first half contracts. Prices for the new year have been named at \$8 a ton, f.o.b. local ovens, and \$8.75, delivered in the Chicago switching district. Shipments of by-product foundry coke are heavy.

Old Material.—Large consumer withdrawal from the market appears not to have disturbed the price structure to any marked degree. Brokers are anxious to cover old contracts, and shipments to consumers are active

Union Wage Rates Slightly Higher

Average wage rates for union labor in 1928, on the basis of 750,000 workers surveyed, are reported by the United States Bureau of Labor Statistics at \$1.159 an hour. This shows a fractional increase over the \$1.154 an hour reported for 1927 for the same group. At the same time, however, there was a slight decline in the weekly full-time wage, because the reduction in average full-time hours in a week was greater than the increase in hourly rates. The average per week

and are subject to stricter inspection than prevailed earlier in the fall. Country scrap, released by higher prices at points of consumption, is flowing in freely, but in some cases it does not meet specifications. Consumption of scrap remains at a high level. Distress tonnage, notwithstanding a greater number of rejections, is readily placed in other directions.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings.....	10.50 to 11.00
Forg'd, cast and r'l'd steel carwheels	17.75 to 18.25
Railr'd tires, charg. box size	17.50 to 18.00
Railr'd leaf spring cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings	14.25 to 14.75
Low phos. punchings.....	16.50 to 17.00
Low phos. plate, 12 in. and under	16.00 to 16.50
Blast Furnace Grades:	
Axle turnings.....	12.00 to 12.50
Cast iron borings.....	11.75 to 12.25
Short shoveling turnings..	11.75 to 12.25
Machine shop turnings....	8.00 to 8.50

Iron rails.....	15.00 to 15.50
Rerolling rails	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.00 to 17.50
Angle bars, steel.....	16.00 to 16.50
Cast iron carwheels.....	14.25 to 14.50
Malleable Grades:	
Railroad	16.00 to 16.50
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00.
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms	20.50 to 21.00
Iron car axles.....	26.50 to 27.00
Steel car axles.....	15.50 to 16.00
No. 1 railroad wrought...	13.25 to 13.75
No. 2 railroad wrought...	13.00 to 13.50
No. 1 busheling.....	11.50 to 12.00
No. 2 busheling.....	6.00 to 6.50
Locomotive tires, smooth..	13.25 to 13.75
Pipes and flues.....	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast.....	15.50 to 16.00
No. 1 railroad cast.....	15.00 to 15.50
No. 1 agricultural cast....	14.50 to 15.00
Stove plate	12.00 to 12.50
Grate bars.....	12.50 to 13.00
Brake shoes	11.50 to 12.00
*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.	

for last year was given as 44.9 hr. Index numbers show the hourly wages at 260.6 in 1928, compared with 259.5 in 1927, on the basis of 100 as the average of 1913. These two figures are much the highest for any years in our history. Full-time hours to the week, however, were 91.9 in 1928, against 92.4 in 1927, both based on 100 in 1913. These were the smallest figures ever recorded. Wages on the full-time weekly basis were 240.6 in 1928, against 240.8 in 1927. While there was a reduction from last year, the two figures are both considerably above the highest ever before reached.

Philadelphia

First Quarter Contracting for Steel Not Yet Commenced— Shipbuilders Bidding on More Tonnage

PHILADELPHIA, Nov. 27.—Consumers of steel are beginning to show interest in first quarter requirements of plates, shapes, bars and sheets, but no formal inquiries of consequence are in the market. Mills are asking 2c., Pittsburgh, on bars and 2.15c., Coatesville, on plates, but the actual price level for first quarter contracts has not yet been established by transactions. As current contracts are at 1.90c. to 1.95c., Pittsburgh, on bars and 2.05c. and 2.10c., Coatesville, on plates, a \$1 a ton advance to the consumer is considered as the probable level of prices by some sellers.

Fabricators are well occupied, and shipbuilders are bidding on a substantial tonnage of shipping, including ships for the Matson and Ward lines. The city of Philadelphia has awarded a dredge and completion of a pilot boat to the Kensington Shipbuilding & Drydock Co. Local radio manufacturers are fully engaged, and the Philadelphia Storage Battery Co. has just acquired additional property for expansion of output.

Pig Iron.—About 20,000 tons of basic, which has been in the market for several weeks, has been bought by an eastern Pennsylvania consumer at \$19.50 per ton, f.o.b. furnace. Contracting for first quarter foundry iron is still confined to small tonnages, many consumers evidently estimating present commitments to be sufficient for requirements well into the middle of the quarter. Among current inquiries is one for 1000 to 1500 tons of floor iron for the Baldwin Locomotive Works, Eddystone, Pa., and tonnages for the Lansdale, Pa., and Dundalk, Md., plants of the Central Foundry Co. Low phosphorus continues inactive except for small-lot purchases. Virginia iron has been advanced 25c. per ton to a basis of \$20.25, furnace, reflecting the recent increase of a like amount in the first quarter price of Birmingham iron.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.		\$21.26 to \$21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.76 to 22.26
East. Pa. No. 1X.....		22.26 to 22.76
Basic (del'd east. Pa.).....		19.75 to 20.00
Gray forge.....		20.00 to 20.50
Malleable.....		21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace).....		22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace).....		23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.		24.79
Va. No. 2X, 2.25 to 2.75 sil.		25.29

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Most of the large consumers have covered their requirements for next year with domestic producers, British sellers having booked only some of the smaller tonnages. Contracts for first half and the entire year are at \$105 per ton, seaboard.

Bars.—Contracting for the next quarter has not yet begun, but on recent requests for quotations mills have asked 2c., Pittsburgh, or 2.32c., Philadelphia. A substantial tonnage of bars will be required in a number

of small reinforced concrete projects, upon which bids are being taken.

Shapes.—Mills report a fair tonnage of shapes moving from their stocks and are seeking to maintain a minimum of 2.05c. per lb., f.o.b. nearest mill to consumer. While this is being quoted on most of the current purchases, large projects apparently bring out substantial concessions. On a recent contract for a 2700-ton manufacturing building in Philadelphia, a mill price of 1.83c. per lb., delivered, is reported to have been quoted on the shapes. Shipbuilding contracts should provide eastern Pennsylvania mills with some substantial tonnage. The New York Shipbuilding Corporation, Camden, N. J., has been asking prices on about 4000 tons of shapes for vessels on which it is bidding.

Plates.—Shipbuilders are contributing a considerable volume of activity to the market in securing prices on plates to use in bidding for ship construction contracts, among which are one to four vessels for the Matson Lines, one ship for the Ward Line and new bids to be submitted at a later date on four ships for the Export Steamship Corporation. The Sun Shipbuilding Co., Chester, Pa., has taken a contract for a 10,000-ton vessel for the American South African Line, Inc., and the New York Shipbuilding Corporation is asking for 12,000 tons of ship plates. The city of Philadelphia has awarded a \$50,000 dredge and completion of a pilot boat to the Kensington Shipbuilding &

Drydock Corporation. Plate prices are unchanged at 2.05c. to 2.15c., Coatesville, on current business, with the higher price asked on contracts for the next quarter.

Sheets and Strips.—New business is small, but shipments on current contracts continue heavy, and prices show considerable firmness, with blue annealed at 2.10c., Pittsburgh, or 2.42c., Philadelphia; black at 2.85c., Pittsburgh, or 3.17c., Philadelphia, and galvanized at 3.60c., Pittsburgh, or 3.92c., Philadelphia. Local sheet consumers are maintaining a high rate of operation, and contracting for the next quarter is expected before long. Hot-rolled strip steel shows a tendency to weakness on the basis of recent quotations. An automotive buyer in this district claims that on a recent inquiry for about a carload of hot-rolled strip steel the quotations were on bases of 1.70c., 1.80c., 1.90c. and 2c. per lb., Pittsburgh. The Pennsylvania Railroad opened bids Nov. 27 on 700 tons of blue annealed, black and galvanized sheets for first quarter.

Imports.—In the week ended Nov. 24, 2985 tons of pig iron arrived at this port from British India. Ore imports were confined to 4729 tons of manganese ore from British West Africa. In ferroalloys, 370 tons of spiegeleisen and 30 tons of ferromanganese were received from the United Kingdom. Steel arrivals consisted of 71 tons of steel bars from Germany and 66 tons of steel bars, 150 tons of strip steel and 133 tons of structural shapes from Belgium.

Old Material.—Activity in all grades of iron and steel scrap is almost entirely in shipments to consumers in fulfillment of old contracts. In the absence of actual transactions, prices are difficult to determine, except on the basis of quotations which brokers are willing to make on mill requirements. Yard grade of heavy melting steel is quoted at \$12.25 to \$12.50 per ton, delivered, with shipments going to Pottsville and Phoenixville, Pa. Other grades are unchanged.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.....	\$15.50 to \$16.00
Scrap T rails.....	15.00 to 15.50
No. 2 heavy melting steel.....	12.25 to 12.50

Cleveland

Steel Bar Prices of 1.90c. to 2c. Named by One Mill for First Quarter—Concessions on Hot-Rolled Strip

CLEVELAND, Nov. 27.—The gain in steel specifications noted a week ago has held up the past week, and November will make a better showing than was expected early in the month. The aggregate tonnage will probably be nearly that entered during October.

The first announcement of a steel bar price for the first quarter has come from an independent steel company, which is naming 1.90c., Pittsburgh, for consumers who use 1000 tons during the quarter and 2c. for smaller consumers. This indicates that there will be no price advance on steel bars for the coming quarter for large-lot buyers, as large consumers placed contracts for the current quarter at 1.90c. The 2c. price compares with a current market price of 1.95c., Pittsburgh, although a minimum amount of small-lot business is being taken at 2c.

When using Cleveland as a basing point, a Youngstown company is asking 1.95c. to 2.05c. for steel bars for the first quarter. The Cleveland mill steel bar price for current orders is 1.90c., mill. Other mills have not yet named first quarter prices on steel bars or on plates and structural shapes.

The only other interesting development in the price situation is a \$2 a ton concession to large buyers from the regular bases for hot-rolled strip, making 1.90c., Pittsburgh, the price for 6-in. and narrower material and 1.80c. for wider than 6 in. to large consumers. Some contracts have been closed at these prices.

The improved demand for steel appears to be due largely to increased activity on the part of the automotive industry, which is releasing specifications for steel and parts for new models to be brought out Jan. 1. Considerable first quarter inquiry is coming from the automobile manufacturers for sheets and strip steel and some have placed contracts.

Plates and structural material are quoted at 1.95c., Pittsburgh, for current orders. The demand for plates is only fair, but structural shapes are moving well to manufacturing plants. Structural awards include 3000 tons placed by the Cleveland Union Terminals Co. and 14,000 tons for railway and highway bridges, the latter taken by an Ohio fabricator. The Great Lakes Engineering Works, Detroit, has taken Lake vessel repair work requiring 1200 tons of plates. New structural inquiry is quiet.

While rail steel reinforcing bars were advanced recently, rerolling mills are still quoting rail steel bars and angles for manufacturing industries at 1.80c., mill.

Pig Iron.—The market still shows a great deal of activity. Prices are firm and unchanged. Cleveland interests sold 46,000 tons in foundry and malleable grades during the week, foundry having been much more active than malleable. While the business was well distributed, jobbing foundries showed more activity during the week than the automotive industry. One Cleveland interest that is well sold up for the first quarter is taking business only for the first half and made several round-lot sales for

that delivery the past week. Another Cleveland producer has opened its books for the second quarter only, having no iron to offer for the first quarter. Other producers are not taking business beyond the first quarter. The local price of \$18.50, furnace, for outside shipment is bringing out considerable business in Ohio, although a Valley producer with an \$18 price is making quite a few sales in the competitive territory in northern Ohio. One Lake furnace is holding to \$19.50 in western Ohio and portions of Indiana. In Michigan the market is unchanged at \$20, furnace. Following a \$2 a ton price advance on Ohio silvery iron by one producer, another maker has marked its price up, but only \$1 a ton, or to \$26 for 8 per cent.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	22.50
Malleable	19.50
Ohio silvery, 8 per cent.	\$29.00 to 30.00
Basic Valley furnace	17.50 to 18.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Fluorspar.—Producers have opened their books for gravel fluorspar for 1929 at the present price of \$18, mines. While they would prefer to make contracts only for the first half, they will not decline to make commitments for the full year. Consumers are showing some interest in contracts. One Ohio steel maker is inquiring for 3500 tons.

Coke.—New demand for foundry coke is light. Specifications on contracts are good. The demand for by-product coke for domestic use, which has been dragging, is being stimulated by the cooler weather. Ohio by-

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.

Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.50c.
Galvanized sheets (No. 24)	4.35c.
Blue ann'l'd sheets (No. 10)	3.45c.
No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

product foundry coke is quoted at \$7.75, Painesville, for December shipment. Connellsville foundry coke is unchanged at \$3.75 to \$4.85 per net ton, ovens.

Sheets.—Considerable business in auto body sheets for the first quarter has been taken at the new 4.10c. price, and some specifications have already been released for January shipment. A few contracts for other grades have also been taken for the first quarter at the advance, but hardly enough to establish definitely the higher prices. Some first quarter business has been taken in enameling stock at 3.90c., Pittsburgh, this grade not having been advanced. Consumers are still able to place sheet tonnage for December shipment at the old prices. Some early shipment orders are coming from the barrel manufacturers.

Semi-Finished Steel.—Specifications continue to come out in heavy volume. A local mill reports one sale of sheet bars, a 6000-ton lot, for the first quarter at \$34, Cleveland. This producer is asking the same price for large billets and slabs, although Valley mills are on a \$33 basis.

Cold-Finished Steel Bars.—Specifications against contracts increased considerably the past week, and there is a fair volume of new business. The improvement in the demand is due to the placing of orders by some of the automobile companies for parts for new models. A price advance for the first quarter is still doubtful. Makers have set Dec. 10 as the last day for specifications on last quarter contracts.

Wire Products.—Nails are moving slowly, as jobbers have good stocks. Price irregularities are still in evidence in some sections. Nails are firm.

Warehouse Business.—A \$2 a ton price advance on sheets, effective Dec. 1, is announced by a local jobber, and others will probably fall in line. This follows the recent advance in mill prices. The demand for most warehouse products has slowed down.

Strip Steel.—While some business in hot-rolled strip has been taken for the first quarter at the regular base prices, some of the mills have shaded this \$2 a ton to large buyers, or to 1.80c., Pittsburgh, for material wider than 6 in., and it is intimated the large-lot buyers can secure a \$2 concession or 1.90c. on narrow strip. Quite a few first quarter contracts for cold-rolled strip have been taken at the 2.85c., Cleveland and Pittsburgh, price. For small lots, mills are getting 2.95c. Specifications continue to come out in fairly good volume.

Reinforcing Bars.—New inquiry is light. On billet steel bars, 1.85c., Cleveland, appears to be the commonly recognized mill price. Jobbers are asking 2.25c., Pittsburgh, for small lots, but the mill competition is preventing them from getting much busi-

ness at that price. Rail steel bars are quoted at 1.95c. mill.

Old Material.—The market is less active than during the past few weeks. While scrap is coming out somewhat more freely than recently at the quoted prices, no weakness has developed. Some of the mills are restricting shipments, and dealers appear able to buy at quoted prices all the scrap they want to fill outstanding orders. No new consumer demand has appeared. Dealers are paying \$15.75 to \$15.80 for high grade No. 1 heavy melting steel against contracts placed recently by one Cleveland mill. No. 1 busheling scrap, which goes mostly to the Valley district, has declined 50c. more a ton. December scrap lists from Michigan automobile companies show considerable less tonnage than a month ago. The largest list, which was for 2500 tons from the Buick plant, was closed late in the week.

New York

Large Pig Iron Sales at Lower Prices—26,500 Tons of Steel Awarded for Bridge

NEW YORK, Nov. 27.—Pig iron sales for the week were large, totaling more than 17,000 tons. Greater interest is being manifested in first quarter iron, particularly by larger melters. Buying, however, is not so general as several weeks ago, and prices are less buoyant. Buffalo foundry iron now ranges from \$17.50 to \$18, furnace, for No. 2 plain, and on the same grade from eastern Pennsylvania for delivery in this section as low as \$19.50, furnace, has been done, although some producers are still asking \$20.50. The removal of the anti-dumping order against German pig iron is without immediate significance. Apparently, no early revival of imports from Germany is in prospect. The leading importer of Indian pig iron has virtually completed sales against shipments that will get under way before Jan. 1, when an increase in ocean freight rates goes into effect. Among current inquiries is one for 2000 tons of high silicon foundry iron from the Eagle Iron & Brass Foundry Co., Passaic, N. J., for first quarter delivery. The Central Foundry Co., New York, has closed for 600 tons of foundry for its Lansdale, Pa., plant and is still in the market for 4000 to 5000 tons for its Dundalk, Md., works.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75 to 2.25	\$22.41 to \$22.91
*Buf. No. 2, del'd east.

Reinforcing Bars.—General contractors' bids on the Davis loft building in Manhattan, calling for 1000 tons of reinforcing steel, will be opened on Dec. 14. The 8500 tons of bars required for the Delaware, Lackawanna & Western terminal warehouse in Jersey City is expected to be placed this week, and Patrick McGovern, Inc., is expected to take action soon on the steel for the water tunnel in Manhattan and Brooklyn, on which it is general contractor. This calls for 2850 tons of bars. The largest award reported recently was a power house near Amenia, N. Y., taking 660 tons, which went to the Concrete Steel Co. The volume of small orders has kept up at a fairly good rate during the month and indications point to considerable activity during December. Prices are strong at the levels quoted last week.

Bars, Shapes and Plates.—Some of the mills will not formally open their books for first quarter until next week. Meanwhile, a few contracts for bars have been entered, including one of 1800 tons, at the prices which the buyers covered for the fourth quarter. A maker of plates in the East has informed a few customers who have inquired that its fourth quarter price tentatively is 2.15c., Coatesville base, but this is subject to revision if, as now seems probable, most of the mills extend the fourth quarter prices into the first quarter. Many of the large buyers of bars are protected for this quarter at 1.90c., Pittsburgh, with 2.05c., Eastern mills, applying on plate and shape contracts for this quarter. Bids will be closed on Dec. 6 by the North New Jersey District Water Supply Commission

the job, subject to the approval of the Governors of New York and New Jersey.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Sheets.—Contracting for the first quarter has progressed during the past week, many consumers having closed for their requirements somewhat further ahead of the opening of a new quarter than has been their practice previously this year. Contracts have been made at the new prices, which represent a \$2 advance, but some mills are still making current sales for immediate specification and for shipment before the end of the year at the former prices.

Warehouse Business.—Jobbers' quotations on sheets are showing more firmness, but small concessions are still obtainable in the New York district. Despite the advanced season, some substantial orders for structural shapes are being placed with warehouses. Business in November has been good, but less than in October, which was the best month of the year for most jobbers.

Cast Iron Pipe.—Quotations of Northern makers of pressure pipe continue strong and the market today is quotable at \$38.60 to \$39.60 per net ton, delivered New York. Inquiries for spring delivery of gas pipe are accumulating and some substantial buying is expected from privately owned gas companies before the end of the year. An inquiry for about 15,000 tons of gas pipe for a large utility company is not yet reported closed. The Brooklyn Union Gas Co., Brooklyn, is inquiring for about 500 tons of large size pipe. Two recent inquiries for water pipe to be exported to South American markets brought out low bids from Continental makers. On about 1500 tons of pipe for shipment to South America, inquired for by the Foundation Co., New York, the Pont-a-Mousson works in France is understood to have been the low bidder, and on 396 tons of 4 to 12-in. pipe for Peru, inquired for by W. R. Grace & Co., New York, the Gelsenkirchen Bergwerks A. G., in Germany, is reported to have submitted the lowest bid on thin-walled centrifugal pipe.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$38.60 to \$39.60; 4-in. and 5-in., \$43.60 to \$44.60; 3-in., \$53.60 to \$54.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Furnace coke prices continue to show greater firmness, but are unchanged at \$2.85 to \$3.05 per net ton, Connellsville. The foundry coke market is moderately active, and prices range from \$3.50 to \$3.75 per ton, Connellsville. Special brands of foundry coke are quoted at \$4.85 per net ton, ovens, or \$3.56, delivered to northern New Jersey, Jersey City and Newark and \$9.44 to New York or Brooklyn. Consumers of by-product foundry coke from the local producer and the New England interest are under contract for first quarter and first half of next year, but the West Vir-

ginia company, which sells into this district, has not opened its books for the coming year. By-product foundry coke prices are unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Prices of all grades of scrap are unchanged, except for a slightly lower level of buying prices on machine shop turnings, \$11 per ton, delivered eastern Pennsylvania, being the present maximum offer. Blast furnace scrap is being shipped to Bethlehem, Pa., at \$9.50 per ton, delivered, and to Swedeland, Steelton and Coatesville, Pa., at \$10.50 per ton, delivered. Some small tonnages of yard grade of heavy melting steel are moving to consumers at Phoenixville, Pottsville and Conshohocken, Pa., to complete old contracts.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$11.75 to \$12.00
Heavy melting steel (yard)	8.25 to 8.50
No. 1 hvy. breakable cast	11.25 to 11.75
Stove plate (steel works)	8.50
Locomotive grate bars	8.50
Machine shop turnings	7.25 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast furn. or steel works)	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought	12.25 to 12.75
No. 1 yard wrot., long	11.25 to 11.75
Rails for rolling	13.00 to 13.50
Cast iron carwheels	12.00 to 12.50
Stove plate (foundry)	9.50
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25
<i>Prices per gross ton, deliv'd local foundries:</i>	
No. 1 machry. cast	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Coal Carbonization Plant for Lukens Company

The International Combustion Engineering Corporation, New York, has closed a contract with the Lukens Steel Co., Coatesville, Pa., which provides for the building of a low temperature coal carbonization plant at Coatesville. It will be the first low temperature coal carbonization plant identified with the steel industry and the second installation in America. Ground will be broken for the Coatesville installation the first of the year and the plant is expected to be in operation early in 1930.

The new plant will be owned and operated by the International Coal Carbonization Co., a subsidiary of the International corporation, which will sell the gas to the Lukens company under a long term contract. Approximately 1,750,000 cu. ft. of gas will be produced daily. This is a high quality gas which will be used for the heat treating of steel throughout the Lukens plant and will replace raw producer gas now used for this purpose. In addition to the gas derived from the new process other valuable constituents of the coal are recovered, consisting of a high quality tar, light oils, a superior grade of anti-knock motor fuel and a high grade domestic

fuel, which will be sold locally. The initial installation will comprise six retorts and will be capable of carbonizing 500 tons of high volatile bituminous coal per day. The daily coke yield available for domestic use will average from 300 to 325 tons. The ultimate plant is designed for double this capacity.

Massillon Hammers Bought by Industrial Brownhoist

Industrial Brownhoist Corporation, Cleveland, announces the purchase of the complete line of Massillon hammers, formerly manufactured and sold by the Massillon Foundry & Machine Co. Production of Massillon single-frame and double-frame forging hammers, steam drop and board drop hammers, as well as trimming presses and bar shears, is now going forward at the Cleveland plant of the corporation. W. J. Cadman, who has been connected with the Massillon organization for many years, will be in charge of the new hammer department for Industrial Brownhoist and will be located in Cleveland.

Machinery Industries to Meet Again Feb. 14

WASHINGTON, Nov. 27.—Notices have been sent out to members of machinery and equipment associations by Philip P. Gott, secretary of the Machinery and Equipment Conference, stating that the next conference has been set tentatively for Feb. 14 at the United States Chamber of Commerce Building. The announcement listed some of the subjects discussed at previous meetings and asked association members to indicate, in order of importance to their industry, the subjects which should be placed on the program for the February conference. They also were asked to suggest the scope of the survey which should be made and the type of information which should be available for discussion, the purpose being to arrive at plans for solution of problems common to the industry.

Subjects listed as having been discussed informally and which are to be treated for specific action include unfair competitive practices, uneconomic practices, tariff, census schedules and classification, depreciation, obsolescence, uniform cost accounting, statistics, credits and sales terms.

A feature of the seventh National Exposition of Power and Mechanical Engineering, to be held at New York, will be a motion picture program running through the entire week of the show, Dec. 3 to 8. The films include "The Handling of Heat," showing the use of Norton refractories in industry, "The Manufacture of Timken Steel Roller Bearings," and "Conowingo," showing the building of the power plant on the Susquehanna River by the Stone & Webster Engineering Co.

Pacific Coast

Awards of Plates, Structural, Reinforcing Bars and Cast Iron Pipe Feature Western Business

SAN FRANCISCO, Nov. 24 (*By Air Mail*).—Important bookings of iron and steel products this week on the Pacific Coast included 1800 tons of plates for oil storage tanks for the Shell Oil Co., San Francisco, placed with the Western Pipe & Steel Co. and the Steel Tank & Pipe Co.; 1800 tons of reinforcing bars for the Life Science Building at Berkeley, taken by the Pacific Coast Steel Co., and 1600 tons for an apartment building in Los Angeles, booked by the Union Iron Works.

Pig Iron.—Movement of foundry pig iron continues limited to small lots. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil.	2.75 to	
3.25		25.00 to 26.00
**Indian fdy., sil.	2.75 to	
3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—More than 2100 tons of reinforcing bars was placed during the week; the largest lot was 1800 tons for a college building at Berkeley, as mentioned above. New inquiries include 400 tons for a school at Portland, 290 tons for an apartment in Los Angeles and about 400 tons for highway work in California. Out-of-stock material in the San Francisco and Los Angeles districts remains at about 1.80c. base. Several fair-sized lots have gone at as low as 1.70c.

Plates.—The only important award this week in the plate market was 1800 tons for six 82,000 bbl. oil storage tanks for the Shell Oil Co. at Martinez, Cal., the business having been divided between the Steel Tank & Pipe Co. and the Western Pipe & Steel Co. Bids were opened last week on 550 tons of 24-in. riveted pipe for Seattle and alternate bids were taken on cast iron pipe. The city decided to purchase cast iron pipe, placing the general contract with L. Coluccio. Prices continue firm at 2.25c., c.i.f., as a minimum.

Shapes.—Awards of structural material this week were the third heaviest of the year and totaled over 7600 tons. The Southern Pacific Co. placed 1500 tons of bridge work with the American Bridge Co. Other outstanding awards included 425 tons for a saw mill at Longview, Wash., for the Weyerhaeuser Lumber Co., booked by

the Star Iron & Steel Works, and 344 tons for an apartment in Los Angeles, secured by the Llewellyn Iron Works. The Wallace Bridge & Structural Steel Co. obtained an order for a steel barge for Young Brothers, Ltd., at Honolulu, calling for 250 tons of channels. A fair volume of pending business is before the trade, most of which is expected to be placed during the next week or 10 days. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—New inquiries for cast iron pipe come out slowly, and pending business does not exceed 1000 tons. The feature of the market this week was the award placed with L. Coluccio by the city of Seattle for 1915 tons of 24-in. Classes B to F pipe for a line from Volunteer Park Reservoir to Queen Anne standpipe. This is the second largest order placed dur-

ing the last half of the current year. Aberdeen, Wash., placed 90 tons of 12-in. Class 250 pipe with the American Cast Iron Pipe Co. The only new inquiry of importance this week was for 292 tons of 4 to 8-in. Class C pipe for Friday Harbor, Wash.

Steel Pipe.—An award of 102 tons of $\frac{3}{4}$ to 1-in. galvanized pipe for the city of Los Angeles is expected to be made during the coming week. An inquiry for 800 tons of 6-in. line pipe for a Los Angeles interest is now being figured on. Some improvement in demand for standard steel pipe is reported by distributors in this section.

Coke.—Demand for foundry coke has shown little improvement and reflects the quiet condition in the pig iron market. Foundry operations, especially among the jobbing plants, continue on a limited basis, and most consumers have sufficient stocks in foundry yards to take care of present requirements. English beehive is quoted at \$16 a net ton, delivered in-coming dock, and by-product coke at \$11.50 to \$13 a net ton.

St. Louis

Substantial Sales of Pig Iron for First Quarter—All Steel Products, Except Plates, in Good Demand

ST. LOUIS, Nov. 27.—The past week was another good one for makers of pig iron. The St. Louis Gas & Coke Corporation sold 9500 tons, and a leading Southern interest sold 4000 tons, all for first quarter. Sales of the Southern iron were at the new price of \$16.50, Birmingham; the largest lot was 500 tons. The Granite City maker's principal sale was 6000 tons of basic to an East Side melter catering to railroads, which had purchased 5000 tons of basic the preceding week for shipment during November and December. Of the local maker's sales of 3500 tons of foundry grades, the largest lot was 600 tons to an East Side equipment maker; an Illinois manufacturer took 400 tons, and there were four sales of 300 tons each to jobbing foundries in the district, while a northern Illinois home appliance manufacturer bought 350 tons. Business with car builders is increasing, and foundries in the St. Louis trade territory which furnish castings to the Ford Motor Co. have been asked to speed up deliveries. The market is firm, and some melters have offered business at present prices for second quarter delivery, but such offers have been declined.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.	
Granite City, Ill.		\$20.00
Malleable, f.o.b. Granite City		20.50
N'th'n No. 2 fdy., deliv'd St. Louis		22.16
Southern No. 2 fdy., deliv'd		20.92
Northern malleable, deliv'd		22.16
Northern basic, deliv'd		22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Colder weather has caused a marked increase in the movement of domestic grades of coke from the by-

product ovens in the district to dealers here and in the trade territory. Local dealers have shown no inclination to accumulate heavy stocks. There has been a heavier consumption of foundry grades in the district. Prices are unchanged.

Finished Iron and Steel.—The Board of Public Service will open bids next week for the third unit of the River Des Peres sewer project, which will require 2000 tons of reinforcing bars; the first unit took about 7000 tons. Structural fabricators report business is dull. The Granite City Steel Co. reports that incoming business so far this month has been equal to that of the same period in October and considerably ahead of that of last November. This applies to all lines except plates, this item being dull, al-

though it is expected to show some life as the result of prospective car business. Warehouse business is beginning to feel the effects of the pre-inventory lull, everyone bending their efforts to keep down stocks of raw materials.

Old Material.—Consumers of old material and dealers in the St. Louis industrial district are still at variance on the question of price. Several of the larger mills have indicated their willingness to buy at prices that prevailed a month ago, but dealers contend for a higher basis. The only price change is on No. 1 railroad wrought, which is 50c. a ton higher. Railroad lists: Chicago, Burlington & Quincy, 5695 tons; Union Pacific, 3100 tons; Big Four, 1350 tons; Frisco Lines, 1000 tons and 12 carloads; Great Northern, 165 carloads; Nickel Plate, 46 carloads; Cotton Belt, 28 carloads.

Birmingham

Pig Iron Advanced to \$17 By One Producer—Bars, Plates, Shapes and Sheets Higher

BIRMINGHAM, Nov. 27.—The new base of \$16.50 for foundry iron is being well received. One producer has advanced its price to \$17. Makers in the district have accumulated sizable backlogs for the first quarter since the opening of books Nov. 15. There has been a steady day to day buying movement, and several of the larger melters have covered for the quarter. Shipments so far this month have been running about equal to those of October, one of the best months of the year. The No. 2 Bessemer furnace of the Tennessee company, which had been banked since Oct. 7, was blown in Nov. 19 on foundry iron. This company is scheduled to make other changes this week owing to the resumption of operations at its Ensley rail mill. Of the 19 furnaces in blast, 13 are on foundry, four on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:
No. 2 fdy., 1.75 to 2.25 sil. \$16.50 to \$17.00
No. 1 fdy., 2.25 to 2.75 sil. 17.00 to 17.50
Basic 16.50

Finished Steel.—An advance of \$2 a ton has been made on bars, plates, shapes and sheets following a gradual strengthening of the market during the past several weeks. Sheets are strong at the new prices and mills are holding closely to quotations in other lines. Inquiries continue active in all lines. The Tennessee company has booked additional rail tonnage, including 13,000 tons for the Southern Pacific. The Ensley rail mill of this company was placed in operation again on Nov. 24. Inquiries are good in the structural plate market. Reeves Brothers have booked an order for 1000 tons of tanks for Ingleside, Tex. Structural steel fabricators are operating on better schedules than at any time in recent months. Pending tonnage is favorable. Sixteen open-hearth continue in operation; the

Tennessee company is working seven at Fairfield, five at Ensley and the Gulf States Steel Co. four at Alabama City.

Cast Iron Pipe.—With new tonnage still running light, backlogs of pres-

sure pipe manufacturers are reduced to a low point. Several plants are operating on part time schedules. A few prospective buyers are feeling out the market and makers are hopeful of improved conditions by the end of the year. Prices are firm at \$37 to \$38 on 6-in. and larger sizes.

Coke.—Most of the new business in foundry coke consists of small-lot orders for immediate delivery as first quarter requirements were well covered several weeks ago. Production is a little heavier than last month. Quotations remain at \$5 for both spot and contract.

Old Material.—The improvement in scrap steel rails reported last week has resulted in an advance of 50c. a ton. Tram car wheels have been advanced \$1 a ton, while No. 1 cast and stove plate have dropped 50c. a ton. Other prices are unchanged. New business is spotty. Shipments improved slightly during the past week and are now moving out in fairly satisfactory volume.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50

*Including quantity differentials.

Providence, R. I., melter has intimated it will make early inquiry for 1000 tons or more of No. 2X and No. 1X, with possibly some malleable, for delivery running into second quarter. In addition, several smaller melters say they will buy an aggregate of about 3000 tons, mostly No. 2X, within the near future. Sales the past week included 1000 tons No. 2X, first and second quarter delivery, to a western Massachusetts melter, and 1500 tons, mostly No. 1X, to a Connecticut machinery builder. Otherwise, less than 3000 tons was sold. Alabama iron is 25c. a ton higher at \$16.50 a ton, base furnace, with regular 50c. differentials, while eastern Pennsylvania is \$21 a ton, base furnace.

Foundry iron prices per gross ton deliv'd to most New England points:

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.
*All rail rate. †Rail and water rate.

Imports.—Local imports of pig iron for the first half of November were 1707 tons, consisting of 881 tons of

Indian and 826 tons of Dutch. Boston pig iron interests believe that the revocation of the anti-dumping duty on German pig iron will not attract tonnages here for a time at least.

Fabricated Steel.—With the exception of one of the largest firms, New England fabricators have sufficient business on their books to keep shops operating on present capacities well into 1929. Competition for business among fabricators is still keen, but jobs are being taken at better prices than two months ago. Several good tonnages are hanging over the market and should be closed shortly.

Warehouse Business.—In point of shipments out of stock, November unquestionably will be the best month experienced this year by warehouse interests. Full list prices and extras are now maintained on all iron and steel products, regardless of the size of business involved.

Coke.—The New England Coal & Coke Co. has just shipped 2900 tons domestic coke to Halifax for the British Empire Steel Corporation's wholesale fuel trade, bringing exports there so far this month up to 5800 tons. Owing to rail orders, the Canadian company has had to blow in another furnace, thereby shutting off its wholesale domestic coke supply. New England foundry coke makers are catching up on specifications. One of them is taking first half contracts at a flat rate of \$11 a ton, delivered within a \$3.10 freight rate zone, instead of on a sliding scale.

Old Material.—Scrap exports have been resumed. A boat is loading 3500

tons mixed No. 1 and No. 2 steel, mostly automobile, for which \$10.50 a ton, on dock, is being paid. The cargo will go to Danzig. It is expected another boat will load 3000 tons late in December. Scrap prices for Pennsylvania mill consumption are practically the same as a week ago. The recent decline has dried up offerings, making it more difficult for shippers to fill old contracts. The American Steel & Wire Co., Worcester, has stopped buying, and local brokers report no negotiations with the Mystic Iron Works. Only an occasional sale of machinery cast to New England foundries is reported, but prices are firm. The Navy Yard, Boston, will take bids on 800,000 lb. structural scrap, 350,000 lb. angles, rods, channels and other miscellaneous smaller lots of scrap.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$10.50 to \$11.00
Scrap T rails.....	10.50 to 11.00
Scrap girder rails.....	10.00 to 10.25
No. 1 railroad wrought.....	11.00 to 11.50
No. 1 yard wrought.....	9.00 to 9.50
Machine shop turnings.....	6.00 to 6.50

Youngstown

Steel Output Now at 80 Per Cent

YOUNGSTOWN, Nov. 27.—Steel business reaching makers in this district, although much smaller in volume than it was in October, is considerably heavier than at this time last year. Production now is about 80 per cent against an ingot output a year ago of less than 60 per cent. Bar specifications are running a little heavier than they did at the beginning of the month, but orders and specifications for other finished products of Youngstown district mills are tapering. No fresh pipe line business of consequence has been booked lately, and as this ordinarily is a period of light sales of other classes of pipe into consumption, distributors are not calling as heavily nor as frequently upon the mills as recently for warehouse replenishments. Sheets are doing comparatively well, and there is not much variation in the rate of strip steel specifications.

In the primary materials, conditions are growing easier. Against a price of as much as \$18.50 for heavy melting steel scrap, melters here say they can now buy at \$17.50 and believe that if they really wanted supplies they might get them even for less. The pinch in the local supply of scrap has been pretty well relieved, and, since scrap originating in and around Detroit cannot much longer be safely shipped by water to Cleveland and Buffalo, there is a possibility of increased supplies becoming available for this district and Canton and Massillon. While there have been sales of basic pig iron at \$18, Valley furnace, the situation appears slightly weaker in view of the fact that there

Canada

Building Construction Continues to Feature Dominion Activities—Pig Iron Demand Brisk

TORONTO, ONT., Nov. 27.—Current demand for merchant pig iron is chiefly for spot delivery. While there is still a steady flow of orders ranging from 50 to 200 tons, orders for as much as 500 tons for early shipment have also been placed. Inquiry is appearing for foundry and malleable iron for first quarter delivery, but producers have not yet opened their books for that period. It is expected that there will be some change in prices before books are opened for 1929 delivery iron. Canadian quotations are firm but unchanged.

Prices per gross ton:

Structural Steel.—Statistics compiled from 63 cities of the Dominion show estimated building values for 10

months of 1928 at \$187,697,420, a gain of nearly \$28,000,000 over the same period of 1927. This activity has been reflected in a steadily increasing demand for structural steel and reinforcing bars. Numerous projects requiring from 50 to 500 tons of steel are pending, and several contracts being figured will take from 1000 to 10,000 tons each. The National Terminals of Canada, Montreal, will require approximately 2500 tons for a warehouse; 10,958 tons will be used in the new store at Yonge and College Streets, Toronto, Ont., for the T. Eaton Co., a part of which has already been ordered. Contracts placed during the week included 750 tons to McGregor & McIntyre Structural Steel Co., Toronto, for Bayview bridge in North York Township; 100 tons to Frankel Brothers, Toronto, for plant for A. R. Williams Machinery Co., Toronto; 2000 tons to Canadian Bridge Co., Walkerville, Ont., for first unit of plant for Chrysler Corporation of Canada; 1250 tons to Standard Steel Construction Co., Welland, Ont., for hotel at Niagara Falls, Ont.; 500 tons

are now steel company offerings of this grade, as against the condition of a few weeks ago when they were not disposed to sell in the belief that they would need all of their production. A recent sale of a round lot at \$17.50, Valley furnace, for first quarter shipment is testimony that \$18, recently asked, is not to be had in all cases.

No formal announcement has been made as to first quarter prices on bars and small shapes, but there is a growing impression that the present prices will be reaffirmed, which would mean 1.90c., base, to the large buyers and 1.95c. to 2c., base, to those with less attractive business to offer.

All sheet makers here subscribe to

the recently announced first quarter prices and some business for that delivery is being entered at the new prices. Higher prices also are being sought for first quarter tonnages of strips, but it is admitted that not much business yet has been done for that period. It is expected that with the opening of negotiations, the hot-rolled strip price will settle to a single base. The new card of extras adopted early in October was formulated with an idea of applying on all widths up to 24 in. and to get away from a triple base, which resulted in no end of confusion and unsettlement in prices. The idea of most makers is a base of 2c., adding the new extras.

the latter figure for small tonnages. Bars, shapes and plates are steady at 1.95c. to 2c., base Pittsburgh.

Coke.—Shipments of by-product foundry coke are running approximately 25 per cent less than in October, and further curtailment in specifications is anticipated as the inventory period approaches. Demand for domestic grades has been about normal for this season. Prices of by-product foundry and of beehive foundry from the New River and Wise County districts are unchanged.

Old Material.—There has been a fair demand from scrap users, and district steel plants are taking their usual commitments on current contracts. Prices are moderately firm, with weaknesses cropping out in certain items, notably cast iron borings, machine shop turnings, No. 1 busheling, railroad and agricultural malleable.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.00 to \$13.50
Scrap rails for melting....	13.25 to 13.75
Loose sheet clippings....	9.50 to 10.00
Bundled sheets	10.25 to 10.75
Cast iron borings.....	9.00 to 9.50
Machine shop turnings....	8.50 to 9.00
No. 1 busheling.....	10.75 to 11.25

Agricultural malleable	12.75 to 13.25

Cincinnati

Alabama Pig Iron Advanced by One Producer to \$17—Sheet Mills of District Hold High Operating Rate

CINCINNATI, Nov. 27.—Sales of almost 31,000 tons and a further upward movement of prices have contributed additional strength to the pig iron market. First quarter buying has been of fairly good proportions, largely on account of the desire of consumers to protect themselves against higher prices, and in a few instances iron for second quarter delivery has been sold. Closely following the recent advance of 25c. a ton on Southern iron has come the announcement by an Alabama producer of a further increase of 50c. to \$17, base Birmingham. While other makers in the South have not formally abandoned their schedule of \$16.50, it is understood that within a day or two all furnace interests will be quoting on the basis of \$17. Incidentally, considerable Southern iron has been sold in the district bordering and adjacent to the Ohio River as a result of the stiffening of prices, most customers having been given opportunity to cover their needs prior to the advance. With northern Ohio sellers maintaining \$18.50, base furnace, and with the Southern iron trend sharply upward, Valley iron has penetrated western Ohio and eastern Indiana and a number of orders were booked at \$18, Valley furnace. Of interest to users of silvery iron is the fact that a discrepancy has appeared in the new schedules of the two Jackson County makers. One furnace has increased its price \$1 a ton on all grades of silvery iron and Bessemer ferrosilicon, whereas the other producer has advanced quotations \$2 a ton. This difference gives a range of from \$26 to \$27, base furnace, on 8 per cent. Southern Ohio foundry iron remains nominally at \$18.50, base Ironton. Sales in the past week included 2500 tons to the Marmon Motor Car Co., Indianapolis, and 3500 tons to another central Indiana melter. The Favorite Stove & Range Co., Piqua, Ohio, is asking for 1000 tons of foundry, and a Kokomo, Ind., con-

sumer is expected to buy a like tonnage.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$20.39
Ala. fdy., sil. 1.75 to 2.25..	\$20.19 to 20.69
Ala. fdy., sil. 2.25 to 2.75..	20.69 to 21.19
Tenn. fdy., sil. 1.75 to 2.25	20.19
S'th'n Ohio silvery 8 per cent	27.89 to 28.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Bookings in the past week have been of fairly liberal proportions, and in the case of district sheet mills have about held pace with production. Specifications have been well distributed among consuming industries, an increasing volume of business having come from automobile manufacturers. Sheet steel prices have not yet been seriously tested, although indications are that consumers are not offering effective resistance to the increase of \$2 a ton in all grades. Sheet mill operations continue at about 100 per cent of capacity, with no decline in production in sight. Makers of rail steel reinforcing bars are quoting 1.90c. to 1.95c. base mill, and are insisting upon

Malleable Castings Output Remains High

WASHINGTON, Nov. 27.—Bookings of malleable castings in October totaled 55,909 net tons, according to reports received by the Department of Commerce from 130 establishments, six of which with an aggregate monthly capacity of 3850 tons were idle during the month. Orders in September amounted to 55,278 tons. Production in October, the second highest since that of March, 1926, was 63,274 tons, or 69.8 per cent of a monthly capacity of 90,713 tons. The capacity for 1928 is based on the average monthly production for the best six consecutive months since Jan. 1, 1919. Output in September was 56,650 tons, or 63.2 per cent of a monthly capacity of 89,696 tons. Shipments in October were 55,423 tons, against 55,645 tons in September.

For the 10 months ended with October orders totaled 547,948 tons, against 480,319 tons for the corresponding period of last year, and 564,158 tons for all of last year. Production was 592,432 tons, or 65.1 per cent of a capacity of 910,609 tons, compared with 542,667 tons, or 51.5 per cent of a capacity of 1,052,386 tons. Shipments were 561,744 tons and 528,454 tons respectively.

Buffalo

Pig Iron Market Less Active, but Prices Are Steady—Steel Mills Continue 90 Per Cent Operations

BUFFALO, Nov. 27.—The pig iron market has not been active and bookings have been light, though prices are being pretty well maintained. The Eastern section sent about 2000 tons of business to a local furnace, including two lots of 500 tons each and one lot of 1000 tons, malleable and foundry. Probably not more than 1000 tons was booked from the immediate Buffalo territory. A New Jersey inquiry calls for 2000 to 3000 tons of foundry, and a recent order from the East was for 400 tons. The melt is exceptionally high throughout the territory served by the Buffalo furnaces and shipments are steady. Canal shipments are off for the year. Producers expect heavy buying soon for first quarter requirements. Operations remain the same.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil.	1.75 to 2.25	\$18.00 to \$18.50
No. 2X fdy., sil.	2.25 to 2.75	18.50 to 19.00
No. 1X fdy., sil.	2.75 to 3.25	19.50 to 20.00
Malleable sil. up to 2.25		18.50 to 19.00
Basic		17.50 to 18.00
Lake Superior charcoal		27.28

Finished Iron and Steel.—Sheet business is being maintained at the regular prices. Inquiry from the automobile trade for bolts and nuts is heavy, though railroad business is not shaping up well. Prices are firm. Reinforcing bar business is lighter. Warehouse business in all kinds of material continues good. Structural awards are not heavy. Operations of

mills continue at about 90 per cent or better.

Old Material.—This market in the past week has been quiet, with little new buying. There is a tendency to keep inventories down as the first of the year approaches. Four of the blast furnace interests have been in the market the past week for scrap, paying \$11.50 for cast iron borings. No. 1 heavy melting steel is still held at \$16.50. No. 2 heavy melting steel is not plentiful for Pittsburgh and Youngstown delivery. Some sales of knuckles and couplers and rolled steel wheels have been made at quoted prices, and a small lot of No. 1 machine cast scrap was sold at \$15.75.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel	\$15.50 to	\$16.50
No. 2 heavy melting steel		14.25
Scrap rails	15.50 to	16.00
Hydraulic comp. sheets		14.25
Hand bundled sheets	12.00 to	12.50
Drop forge flashings	13.50 to	14.00
No. 1 busheling	14.50 to	15.50
Hvy. steel axle turnings	13.50 to	14.00
Machine shop turnings	7.50 to	8.00
No. 1 railroad wrought	14.50 to	15.00

Acid Open-Hearth Grades		
Knuckles and couplers	17.00 to	17.50
Coil and leaf springs	17.50 to	18.00
Rolled steel wheels	17.00 to	17.50
Low phos. billet and bloom ends	18.00 to	18.50

Electric Furnace Grades		
Short shov. steel turnings	11.00 to	11.50

Blast Furnace Grades		
Short shov. steel turnings	11.00 to	11.50
Short mixed borings and turnings	11.00 to	11.50
Cast iron borings	11.00 to	12.00

Reinforcing Steel

New Projects Call for 8800 Tons

WITH two high schools in Chicago calling for 2100 tons, a sewer project at St. Louis for 2000 tons, and a warehouse at Chicago for 1600 tons, new projects brought out in the last week will require 8800 tons of bars. Awards of 3800 tons included 1800 tons for building at the University of California. Awards follow:

NEW YORK, 185 tons, Evander Childs High School, to Tidewater Structural Materials Corporation.
AMENIA, N. Y., 660 tons, power house; from M. Kantrovitz, Albany, N. Y., general contractor, to Concrete Steel Co.
NUTLEY, N. J., 175 tons, manufacturing

building for Hoffmann LaRoche Chemical Co., to Igoe Brothers.

CINCINNATI, 250 tons, Heberle School, to Pollak Steel Co.

CHICAGO, 300 tons of rail steel bars, sales building for Studebaker Corporation, to Inland Steel Co.

CHICAGO, 100 tons of rail steel bars, manufacturing building for Hump Hairpin Co., to Inland Steel Co.

CHICAGO, 100 tons, social science building for University of Chicago, to Joseph T. Ryerson & Son, Inc.

CHICAGO, 200 tons of rail steel bars, apartment building at Ashland Avenue and Pratt Boulevard, to Calumet Steel Co.

SEATTLE, 100 tons, Third Avenue South paving, to Northwest Steel Rolling Mills.

WALLA WALLA, WASH., 100 tons, Veterans' Hospital, to unnamed interest.

SACRAMENTO, CAL., 127 tons, highway

work in San Luis Obispo County, to unnamed interest.

BERKELEY, CAL., 1800 tons, Life Science Building, University of California, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW HAVEN, CONN., 200 tons, armory.

NEW YORK, 200 tons, Lincoln High School; George F. Driscoll Co., Brooklyn, general contractor.

JERSEY CITY, 125 tons, laboratory for Port of New York Authority.

HACKENSACK, N. J., 200 tons, bridge work for Pennsylvania Railroad; Foundation Co., general contractor.

CINCINNATI, 100 tons, hangar for municipal airport.

CHICAGO, 150 tons, sewer project for Sanitary District.

CHICAGO, 700 tons, apartment building on Lake Shore Drive; R. DeGolyer, architect.

CHICAGO, 100 tons, naval armory; Zackery Davis, architect.

CHICAGO, 1600 tons, revised bids for General Electric warehouse; Graham, Anderson, Probst & White, architects.

CHICAGO, 2100 tons, two newly projected high schools and two projects being refigured.

CHICAGO, tonnage not stated, eight-story apartment building at Jackson Boulevard and Hamlin Avenue; Rissman & Hirschfeld, architects.

ROCKFORD, ILL., 190 tons, St. Anthony's Hospital.

ST. LOUIS, 2000 tons, Board of Public Service for third unit of River Des Peres sewer project.

SACRAMENTO, CAL., 275 tons, highway work in Imperial County; bids Dec. 19.

SACRAMENTO, 103 tons, highway work in San Diego County; bids Dec. 12.

SACRAMENTO, 188 tons, bridge near Benham; Paul N. White, Santa Monica, low bidder.

PORTLAND, ORE., 400 tons, school; bids being taken.

LOS ANGELES, 290 tons, apartment building, Hillcrest and Franklin Streets; bids being taken.

Detroit Scrap Market Has Firm Tone

DETROIT, Nov. 27.—The market on old material has a very firm tone, with No. 1 busheling showing an advance of 50c. per ton and flashings making a gradual advance over the past 10 days or two weeks of 75c. per ton. The latter material is being used considerably by foundries in the district and this increased local consumption has been a strong factor in the advance. Other prices are as quoted a week ago.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	12.25 to 12.75
Stove plate	11.00 to 12.00
No. 1 busheling	11.00 to 11.50
Sheet clippings	8.00 to 8.50
Flashings	11.50 to 12.00

The David J. Joseph Co., 124 Harrison Avenue, Cincinnati, old material dealer, on Dec. 1 is moving its offices to the American Building, Central Parkway and Walnut Street.

Non-Ferrous Metal Markets

Copper Quiet and Firm, Tin Active and Higher, Lead Sales Large, Zinc Buying Heavy With Prices Higher

NEW YORK, Nov. 27.

Copper.—Generally the market is very quiet and buying is confined to fill-in requirements and to some future positions as far ahead as February. Domestic consumers have been buying some December metal, but are well covered for January and nearly so for February. The foreign market is quieter than for some time, although sales for the month thus far are about 30,000 tons; November domestic sales are estimated at 35,000 tons. There is very little inquiry for March metal and still less disposition on the part of producers to sell it. Prices continue very firm and unchanged at 16c., delivered in the Connecticut Valley, for electrolytic cop-

*Refinery quotation; delivered price ¼c. higher.

per, with the official quotation of Copper Exporters, Inc., at 16.25c., c.i.f. European ports. The Lake copper market is exceedingly quiet and firm at 16c. to 16.12½c., delivered.

Tin.—Over 2000 tons was sold in an active week ended with Nov. 24, and both dealers and consumers were good buyers. Profit taking on some days did not disturb the market and all offerings were easily absorbed. Straits shipments for November will apparently be very large. At the end of last week the total was close to 9000 tons and the estimate of 10,000 tons for the month will probably be fulfilled. Stocks of tin in London, at approximately 5400 tons, show an increase, but the greater part of this is in control of market manipulators who have virtually taken it out of the market. They thus have a firm grip on the course of prices, but some day this metal must be sold. Prices

both here and abroad have advanced sharply and spot Straits tin sold here today at 52.87½c., New York. London prices were considerably higher than a week ago, with spot standard quoted at £239 2s. 6d., future standard at £236 and spot Straits at £239 5s. The Singapore market today was £237 12s. 6d. The market yesterday was moderately active, with about 200 tons changing hands, but today it has been very quiet. Arrivals thus far this month have been 4825 tons, with 5895 tons reported afloat.

Lead.—Sales have been in very good volume practically every day and prices are stiffer in the West. December delivery is principally involved, but there have been sales of spot and January metal. The St. Louis price, which was 6.17½c. last week, is now generally at 6.22½c., with perhaps a little metal still available at 6.20c. The contract price of

the leading interest is still unchanged at 6.35c., New York.

Zinc.—Conditions have radically changed the past week. Galvanizers generally have come into the market and a very large amount of prime Western zinc has been sold for delivery in the first quarter. As a result, prices have advanced for the first time since Aug. 7. At that time, 6.25c., East St. Louis, was established and it had prevailed until yesterday, when metal was sold at 6.30c. Today the market has further stiffened and prices are generally at 6.35c., although a little metal may still possibly be obtained at 6.32½c. As the result of the more active market, sales of ore last week at Joplin were high at about 15,300 tons at the unchanged price of \$40. Output was a little larger at 11,500 tons and ore shipments were over 12,300 tons. Today the market for prime Western is quieter, with producers somewhat reserved as to future commitments.

Antimony.—In a very quiet market, Chinese metal is easier at 10c., duty paid, New York, for all positions.

Nickel.—Ingot nickel in wholesale lots is quoted unchanged at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 27.—Both spot and future purchases are active in a market which shows mixed tendencies. Prices for copper are lower and quotations for lead, zinc and tin are higher. The old metal market is without feature.

Prices, per lb., in carload lots: Lake copper 16.50c.; tin, 51.12½c.; lead, 6.25c.; zinc, 6.45c.; in less-than-carload lots; antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Ludlum Steel Co. to Expand Capacity

The Ludlum Steel Co., Watervliet, N. Y., and the Atlas Steel Corporation, Dupkirk, N. Y., have called special meetings of stockholders to vote on the consolidation of the two companies. If the vote is favorable, some plan of financing will be arranged that will retire all of the present securities of both companies standing ahead of common stocks. The Ludlum company requires increased capacity for the manufacture of its special brands of valve steel and stainless steels and also for the new series of chrome nickel steels which will be manufactured under its license agreement with the Krupp Nirosta Co., Inc.

The Ludlum company will also erect a plant for the manufacture of tungsten carbide tools and dies under combined patents of the Krupp works and the General Electric Co. Construction of the plant will be begun at once and the design will be based upon specifications supplied by Prof. Dr. Benno Strauss of the Krupp research laboratory, who is at present in this country.

Directors have also authorized the construction of a plant for the drawing of chrome nickel and other highly alloyed steel wire by a German process for which the company has acquired the exclusive American rights. Orders have already been placed in Germany for 30 special wire drawing machines together with the necessary annealing apparatus. In about five months the company expects to be able to supply non-corrosive wire in sizes ranging from 0.195 in. to 0.001 in.

New Tin Trade Association Elects Officers

C. S. J. Trench of C. S. Trench & Co., New York, has been elected president of the American Tin Trade Association, recently formed to supplement the activities of the new National Metal Exchange.

Other officers will be A. B. Hall of the National Lead Co., vice-president, and Martin H. Wehncke of Brandeis, Goldschmidt & Co., treasurer. In addition to the officers, the directors will include Edwin Groves of J. W. Phyfe & Co., John Hughes of the United States Steel Corporation, James E. Pope of the Pope Trading Corporation and Erwin Vogelsang of Lewis Lazarus & Sons of New York, Inc.

The new association has adopted a specific quality tin contract, which will govern dealings in Straits and other specific qualities of tin. It is modeled after the style of the present New York Metal Exchange tin contract, which will no longer be available after Dec. 1, when the New York Metal Exchange goes into liquidation. Nearly all classes of dealers in and large consumers of tin have joined the new association. The main object is to assure uniform contracts for all transactions in the metal.

Railroad Equipment

Orders for 2900 Freight Cars—New Inquiries Amount to 4000

WITH 2000 automobile cars bought by the Wabash and 700 miscellaneous freight cars ordered by the Chicago & North Western, car purchases in the last week totaled 2900. New and contemplated inquiry for more than 4000 cars included 2500 for the Louisville & Nashville, 250 for the Chicago, Rock Island & Pacific and 1025 for the Atchison, Topeka & Santa Fe. Details of the week's business follow:

Wheeling & Lake Erie will build five six-wheel and five eight-wheel switching locomotives in its own shops.

Louisville & Nashville will soon make inquiry for 1200 50-ton and 250 70-ton gondola cars, 750 50-ton automobile cars, 300 50-ton box cars, 12 passenger coaches, six baggage and four dining cars.

Wabash has ordered 1500 automobile cars from American Car & Foundry Co. and 500 from Pullman Car & Mfg. Corporation.

Seaboard Air Line contemplates purchase of 200 all-steel hopper cars.

Missouri Pacific is inquiring for 100 steel underframes.

Chicago, Rock Island & Pacific has come into market for 250 ballast cars. This brings road's total inquiries to 3400 freight and 22 passenger cars.

Hercules Powder Co., Wilmington, Del., has ordered 10 50-ton tank cars from American Car & Foundry Co.

St. Louis-Southwestern has ordered steel underframes and parts for rebuilding five ballast cars from American Car & Foundry Co.

Chicago & Eastern Illinois may buy 300 automobile cars instead of 100 as reported previously.

Chicago, St. Paul, Minneapolis & Omaha has ordered four gas-electric passenger cars from Pullman Car & Mfg. Corporation.

Chesapeake & Ohio has ordered six gas-electric rail motor cars from J. G. Brill Co.

Green Bay & Western is inquiring for four or five combination baggage and mail cars.

Chicago & North Western has ordered 400 composite gondola cars from Standard Steel Car Co., 300 flat cars from Pressed Steel Car Co., 100 caboose car underframes from American Car & Foundry Co. and 10 gas-electric rail motor cars from Pullman Car & Mfg. Corporation.

Montour Railroad has ordered 10 caboose cars from Standard Steel Car Co. Armour Car Lines, Chicago, have ordered 500 underframes for refrigerator cars from Bettendorf Co.

Fruit Growers Express has increased its inquiry for refrigerator car underframes from 50 to 200.

Nevada Consolidated Copper Co. has ordered 80 ore cars from Koppel Industrial Car & Equipment Co.

Atchison, Topeka & Santa Fe is in market for 200 flat, 500 single-deck stock and 250 double-deck stock cars, 125 caboose cars and 16 baggage cars.

Great Northern has purchased 500 underframes from Pressed Steel Car Co. and is inquiring for three dining cars.

Otis Steel Co. Puts New Open-Hearth in Use

The Otis Steel Co., Cleveland, placed a new open-hearth furnace in operation the past week, this being the third new furnace to be built and started this year. This gives the company eight open-hearth furnaces at its Riverside plant, with an annual ingot capacity of 720,000 tons. In addition, it has an annual ingot capacity of 170,000 tons at its Lakeside plant.

PERSONAL

COL. FRANK A. SCOTT, chairman of the board of Warner & Swasey Co., Cleveland, has resigned as chief of the Cleveland Ordnance District, which position he has held for four years. His resignation was necessitated by poor health. As head of the Cleveland Ordnance District and member of the military organization created under the National Defense Act, Colonel Scott has supervised the Army's program of industrial preparedness in the important manufacturing area extending from Erie, Pa., to Toledo and from the shores of Lake Erie to Columbus. To show its appreciation of his services and regret over his retirement the Army has presented Colonel Scott with an official resolution embossed on parchment. The presentation was made at his home in Mentor, Ohio, Nov. 22, by Brig. Gen. Colden L'H. Ruggles, assistant chief of ordnance, who in making the presentation said: "The Army is sorrowful today because it is losing the services of a great leader. And we regard you, Colonel Scott, as truly a casualty of the World War as the man who was wounded in performance of his duty on the battle front." Colonel Scott stood foremost among the industrial leaders who rendered preeminent service during the World War. He served both as chairman of the General Munitions Board and later as chairman of the War Industries Board.

ERNEST F. DUBRUL, general manager of the National Machine Tool Builders Association, was the guest of the Boston chapter of the National Association of Cost Accountants on Nov. 22, at the Boston Chamber of Commerce. He spoke on "Depreciation on the Basis of Replacement Values."

THOMAS W. KENNEDY, vice-president in charge of blast furnace operations for the Massachusetts Gas Companies, Boston, and president and manager of the Mystic Iron Works, Everett, Mass., has been made a trustee and vice-president of the New England Fuel & Transportation Co., a Massachusetts Gas Companies subsidiary. Mr. Kennedy also has been made a director of the New England Coal & Coke Co., the Prince-Wick Coal Co., the Pemberton Fuel Co., the Long Branch Coal Co., the E. E. White Coal Co., the Glencoe Coal Co., and the East Gulf Coal Co. With the exception of the New England Coal & Coke Co., the last mentioned companies are subsidiaries of the C. C. B. Smokeless Coal Co. and are located in the New River field of West Virginia. The C. C. B. Smokeless Coal Co. is a subsidiary of the parent company, as is the New England Coal & Coke Co.

O. NEEDHAM, formerly section engineer in charge of steel mill engineer-

ing for the Westinghouse Electric & Mfg. Co., has been appointed assistant superintendent in the testing department, East Pittsburgh works. WILLIAM B. SHIRK succeeds Mr. Needham. The latter has been with the Westinghouse company since just after his graduation in 1909 from the Oklahoma Agricultural and Mechanical College. Mr. Shirk was graduated in electrical engineering from Lehigh University in 1920 and before joining the Westinghouse company in 1925 he was assistant superintendent of electrical equipment for the Bethlehem Steel Co.

GEORGE R. JOHNSON has been named Pittsburgh resident agent for the M. A. Hanna Co. He succeeds GEORGE D. BUCKWELL, who resigned several months ago to become manager of pig iron, coke and by-products sales of the Davison Coke & Iron Co. Mr. Johnson has been with the Hanna company since 1909, for 11 years at the Pittsburgh, Youngstown & Ashtabula Ore Co. docks at Ashtabula, Ohio, and for eight years as cashier at the Cherry Valley furnace, Leetonia, Ohio. Since early this year he has been engaged in pig iron sales in the Pittsburgh office of the company.

HERBERT MAY, assistant treasurer Union Drawn Steel Co., Beaver Falls, Pa., has been elected vice-president of the company and will continue as assistant treasurer.

K. P. SWENSEN has been placed in charge of the New York office, 117 Liberty Street, of the Radiore Co., Los Angeles. He has had wide experience in mining engineering and electrical prospecting.

WADSWORTH DOSTER, recently Eastern representative for the Mackintosh-Hemphill Co., Pittsburgh, has been appointed to serve in a similar capacity with the United Engineering & Foundry Co., Pittsburgh. Previously he was for many years manager of the Blake & Johnson Co., Waterbury, Conn.

P. N. GUTHRIE, JR., since 1909 associated with the South Chester Tube Co., South Chester, Pa., has been appointed vice-president in charge of sales for the Reading Iron Co., Reading, Pa. The general sales offices of the company will be transferred from Reading, Pa., to 30 Church Street, New York, where Mr. Guthrie will maintain headquarters. H. F. MATERN will continue as general sales manager. Mr. Guthrie was born in Pittsburgh and his first business association was with the Black Diamond Steel Works in that city. Before joining the South Chester company he was for several years identified with

the gas light industry in New York State.

GEORGE E. EVANS, for the past 31 years manager of the Ontario division of the Dominion Bridge Co., Toronto, has retired from active service and has been succeeded by A. ROSS ROBERTSON. Mr. Evans will remain with the company in an advisory capacity.

S. JANOVICI has been elected president and treasurer, and J. GILBERT MASON, JR., vice-president and secretary, of the Orelite Co., Inc., 109 Broad Street, New York, producer of natural and calcined diatomaceous earth for insulation purposes. A. JANOVICI has been named assistant secretary of the company and M. J. KAUFMAN, assistant treasurer.

DR. HARVEY NATHANIEL DAVIS, for the last nine years professor of mechanical engineering at Harvard University, was inaugurated as president of the Stevens Institute of Technology on Nov. 23. At a scientific session preceding the installation ceremonies papers were read by DR. ROBERT A. MILLIKAN, of the California Institute of Technology, and DR. JOHN JOHNSTON, director of research for the United States Steel Corporation. The occasion also marked the unveiling of a memorial tablet to the late DR. ALEXANDER C. HUMPHREYS, for 25 years president of Stevens.

M. CROUSE KLOCK, Syracuse, N. Y., has been elected a director of the Crucible Steel Co. of America, New York.

E. V. NIXON, of Thompsons Engineering & Pipe Co., Ltd., Castlemaine, Victoria, Australia, is spending a short time in the United States on his return home from a visit to England. He is studying steel foundry association activities. His present address is the Union League Club, Thirty-ninth Street and Fifth Avenue, New York; he plans to sail from Vancouver, B. C., Dec. 12.

CHARLES B. KING, vice-president and general manager of the Marion Steam Shovel Co., Marion, Ohio, was elected president of the Ohio Manufacturers Association at the annual meeting held in Cleveland, Nov. 21. New vice-presidents included: J. D. COX, JR., president Cleveland Twist Drill Co.; CHARLES R. CLAPP, National Supply Co., Toledo; P. O. GEIER, Cincinnati Milling Machine Co., Cincinnati; T. J. BARNES, Barnes Mfg. Co., Mansfield, and A. F. SPARKS, James Leffel Co., Springfield.

GEORGE ADAMS has been appointed sales manager of the Bunting Brass & Bronze Co., Toledo, Ohio.

FRANK P. MCKIBBEN, Blackgap, Pa., structural steel engineer, addressed the Engineers Society of Milwaukee at its monthly dinner meeting on Nov.

21, his topic being "Electrically Welded Steel Buildings." The meeting was under the auspices of the Milwaukee chapter, American Institute of Electrical Engineers.

HARRY W. TERRY, formerly sales manager Bayley Blower Co., Milwaukee, and widely known as a merchandising and engineering counselor, has joined the industrial advertising division of the Cramer-Krasselt Co., Milwaukee advertising agency.

H. N. FELTON, since 1927 Milwaukee branch manager for the Wagner Electric Corporation, St. Louis, has been appointed branch manager of the corporation's New York office, succeeding E. W. GOLDSCHMIDT. Mr. Felton was graduated from the University of Illinois in 1917 and went with the Wagner corporation in 1919 as a salesman in the Chicago district. He has been identified with the Milwaukee office since 1920. E. T. COUP, who has been in charge of the Cincinnati office since 1921, has been named to succeed Mr. Felton at Milwaukee. He has been identified with the company since his graduation from the University of Wisconsin in 1912, having served previously at St. Louis, Chicago, Boston and Milwaukee. PAUL F. FORSYTH succeeds Mr. Coup at Cincinnati. He was graduated from Pennsylvania State College in 1912 and before joining the Wagner organization in 1915 he was associated with the J. G. White Co., New York, and the Detroit Edison Co., Detroit. He has since served the St. Louis company in Chicago, Detroit and Cincinnati.

BARNEY G. TANG, assistant general superintendent of the Schenectady, N. Y., works, General Electric Co., has been named general superintendent, succeeding the late JAMES A. SMITH. He joined the company in 1898 and served in the searchlight, switchboard and switch departments. Later he became a subforeman in the tool room and subsequently superintendent of a plant section. JOHN D. HARNDEN, recently superintendent of the testing department, has been appointed assistant to the works manager, F. L. KEMP succeeding him in the testing department. LEROY BEERS has been named plant engineer, a newly created position.

E. W. GOLDSCHMIDT, Eastern district manager of the Wagner Electric Corporation, St. Louis, with headquarters at New York, who has represented the company in that city for 25 years, has retired from his active duties and will devote his entire time to the electric light and power industry as chairman of the exhibition committee of the National Electric Light Association.

R. W. RUDDON, first vice-president of the Federal Motor Truck Co., Detroit, has been appointed general manager of the company and in his new

capacity will take over part of the responsibilities formerly held by M. L. PULCHER, who has been president and general manager. Mr. Pulcher will continue as president of the company. Mr. Ruddon joined the Federal organization 15 years ago as secretary to Mr. Pulcher. In 1918 he became assistant secretary of the company; in 1924, assistant general manager, and early this year, first vice-president. During the last few years his work has largely been centered about the financial affairs of the company.

DR. ROBERT REINER, president Robert Reiner, Inc., Weehawken, N. J., manufacturer of textile machinery, addressed the monthly meeting of the Credit Association of the Building Trades of New York on Nov. 27.

VERNON C. WARD, recently manager of sales in the steel construction department of the Jones & Laughlin Steel Corporation, Pittsburgh, has been appointed a vice-president of the J. B. French Co., 30 North Michigan Avenue, Chicago, building contractor. Before joining the Jones & Laughlin organization he was contracting manager at Chicago for the American Bridge Co.

EARL C. REED and LEWIS N. MURRAY, organizers of the Continental Heater Corporation, Dunkirk, N. Y., which last year became a part of the National Radiator Corporation, are president, and vice-president and treasurer, respectively, of the Dunkirk Radiator Corporation, Dunkirk, which has been organized to manufacture radiators and heaters. NEWELL F. GOULD, who is secretary of the new company, was formerly treasurer of the United States Radiator Co., Detroit, and also vice-president of the Marshal Valve Co., Dunkirk. Among the directors are WILLIAM C. MURRAY, formerly manager of the Utica Heater Mfg. Co., Utica, N. Y., and HOWARD REED, recently plant superintendent of the Continental corporation.

ALBERT N. DINGEE, for the last 18 years identified with the sales department of the Electric Storage Battery Co., Philadelphia, has been appointed advertising manager to succeed the late ALFRED B. KREITZBURG.

CARL W. PEIRCE, late open-hearth superintendent of the Mansfield Sheet & Tin Plate Co., Mansfield, Ohio, has become connected with the Arthur L. Stevens Corporation, 205 West Wacker Drive, Chicago. This organization has developed a form of combustion control for open-hearth furnaces which is said to have great possibilities. Mr. Peirce, a graduate of Oberlin College, has spent many years in open-hearth work, having been at the South Side plant of Jones & Laughlin Steel Corporation, Gary plant of Illinois Steel Co., the former New York State Steel Co., Buffalo, and elsewhere.

Obituary

GARLAND G. KING, purchasing agent Alliance Machine Co., Alliance, Ohio, died recently at Dalton, Ga., while en route to Florida, where he had spent the winter in recent years. He had been identified with the Alliance company since its organization.

J. MAX. BERNARD, of J. Max. Bernard & Co., Philadelphia, steel, coal and coke merchants, died Nov. 17, at his home near Media, Pa. He was 66 years of age and was well known in the steel and coal trades of the Philadelphia district, where he was identified with his own company for about 25 years, prior to which he was for about seven years associated with C. B. Houston & Co., Philadelphia, steel and coal merchants.

EDGAR H. MORGAN, president of the Arcade Mfg. Co., Freeport, Ill., died suddenly on Nov. 16. He was born at Marlboro, N. Y., in 1848 and moved to Freeport with his parents in 1853. When he was 16 he entered a foundry owned by his uncle and after learning the molders' trade he was admitted to partnership.

IRVING ROSS STANWOOD, of the Charles E. Bedaux Co., New York, died recently. He was born at Needham Heights, Mass., in 1892, and was graduated from Colby College, Waterville, Me. He then became associated with the Winchester Arms Co., New Haven, Conn., and later with the Agar Mfg. Co., Somerville, Mass.

FRANCIS MARION KING, president North Wales Machine Co., North Wales, Pa., and treasurer and general manager Challenge Machine Co., Philadelphia, died on Nov. 20 at his home in Philadelphia, aged 82 years. He was born at Wilmington, N. C., and established the companies with which he was associated 42 years ago.

STRICKLAND LANDIS KNEASS, vice-president of William Sellers & Co., Inc., Philadelphia, died at Daylesford, Pa., on Nov. 25. He was born at Philadelphia in 1861 and was graduated from Rugby Academy. In 1880 he was graduated in civil engineering by the Rensselaer Polytechnic Institute, Troy, N. Y. He became manager of the injector department of the Sellers company in 1895 and had been associated with the company ever since. He was awarded the John Scott Medal and premium of the Franklin Institute in 1900 and in 1926 his exhaust feed-water injector for locomotive boilers again brought him the award.

GEORGE ARTHUR STEPHENS, from 1902 until 1918 president of the Moline Plow Co., Moline, Ill., died on Nov. 20 in New York, where he had been taken the week before for medical treatment. He was 77 years of age. The Moline company has been succeeded by International Harvester Co.

Continental Deliveries Extending

German Lockout Strengthens Prices but Early Settlement May
Bring Reaction—British Pig Iron Market Improving

(By Cable)

LONDON, ENGLAND, Nov. 26.

HOME demand for Cleveland pig iron is improving and withdrawals from stocks at furnaces are averaging 1000 tons a day. Export sales, however, are still restricted. Hematite is active and preparations are being made to blow in two more East Coast furnaces. Prices are stiffening.

The foreign ore situation is improving here, but on the Continent it is affected by the German lockout and stocks are accumulating at Emden and Dutch ports.

Finished iron and steel has not yet been affected by the German situation and business in heavy material is still slow. Some new shipbuilding contracts will require more steel tonnage, but export sales are poor and plate mills are especially in need of work. Semi-finished steel mills are moderately active as foreign supplies are smaller. The Blue Star Line has placed an order for a 12,000-ton motor vessel with Palmer's Shipbuilding & Iron Co.

Tin plate is quiet and mills are in need of orders for the remainder of the year, but well sold for the early part of next year. Current output of tin plate is about 75 per cent of capacity, as several mills have resumed operation, having completed the agreed period of suspension.

Galvanized sheets are moderately

active in small lots and most makers are quoting January as the earliest shipment, with some sales covering January-March delivery. Black sheets are quiet.

Continental markets are quiet in

trade with British buyers, but some activity is reported from other markets. Prices generally are unchanged, but stability is lacking and a decline is expected should the German lockout reach a speedy conclusion.

Belgian Market Advancing

Mills Well Filled Since German Lockout, With Deliveries
Lengthening—British Pig Iron Competitive

ANTWERP, BELGIUM, Nov. 9.—Prices show a decided tendency to advance as a result of the lockout in Germany, which has temporarily removed German mills from the export trade. Buyers, however, are resisting the efforts of mills to obtain advanced prices, so that it is difficult to ascertain the actual market at which business is being transacted. Steel bars have been advanced, and certain other products are on a slightly higher level than in recent weeks. Some desirable tonnages of steel have been booked from Japan, China, India and South America, and deliveries of most mills are extending. If the German lockout remains in effect for a few weeks more, it is believed that the steel market will continue to advance and the recession of business that had been evident will be temporarily arrested.

Pig Iron.—Demand for phosphoric foundry iron continues steady, and the stocks of both producers and consumers are low. The export price is firm at £3 6s. (\$16.04) per ton, f.o.b. Antwerp, which is also the quotation for British Midland iron, f.o.b. Antwerp, so that British furnaces are obtaining some business here. Thomas iron shows weakness because of British competition. Bessemer hematite iron quotations are governed by British offers and continue at £3 14s. to £3 16s. (\$17.98 to \$18.47) per ton, c.i.f. Antwerp, or f.o.b. furnace. Iron and steel scrap prices show further advances despite substantial arrivals of scrap from England. Stocks are limited, with heavy melting steel at 104 Belgas (\$14.45) and No. 1 cast scrap at 130 Belgas (\$18.07).

Semi-Finished Material.—Demand is light, but sellers have only limited

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.25
Bilbao Rubio ore*.....	1 2	to £1 2½s.	5.35 to \$5.48
Cleveland No. 1 foundry.	3 8½	to 3 9½	16.64 to 16.89
Cleveland No. 3 foundry.	3 6		16.04
Cleveland No. 4 foundry.	3 5		15.80
Cleveland No. 4 forge....	3 4½		15.68
Cleveland basic (nom.)..	3 5		15.80
East Coast mixed.....	3 10	to 3 11	17.01 to 17.25
East Coast hematite.....	3 10½	to 3 11½	17.13 to 17.37
Rails, 60 lb. and up....	7 15	to 8 5	37.66 to 40.10
Billets	6 5	to 6 10	30.37 to 31.59
Ferromanganese	13 15		66.83
Ferromanganese (export)	14 0		68.04
Sheet and tin plate bars, Welsh	6 0		29.16
Tin plate, base box.....	0 18	to 0 18½	4.37 to 4.40
Black sheets, Japanese specifications	13 7½		65.00
Ship plates	7 12½	to 8 2½	C. per Lb. 1.63 to 1.74
Boiler plates	9 0	to 10 10	1.92 to 2.25
Tees	8 2½	to 8 12½	1.74 to 1.84
Channels	7 7½	to 7 17½	1.58 to 1.69
Beams	7 2½	to 7 12½	1.53 to 1.63
Round bars, ¾ to 3 in..	7 10	to 8 0	1.62 to 1.69
Steel hoops	9 0	to 10 0	1.92 to 2.14
Black sheets, 24 gage....	10 0		2.14
Galv. sheets, 24 gage....	13 10	to 13 15	2.93 to 2.98
Cold rolled steel strip, 20 gage (nom.).....	16 0		3.42

*Ex-ship, Tees, nominal.

Continental Prices All F.O.B. Channel Ports

(Per Metric Ton)				
Foundry pig iron (a):				
Belgium	£3 3s.	to £3 5s.	\$15.31	to \$15.80
France	3 3	to 3 5	15.31	to 15.80
Luxemburg	3 3	to 3 5	15.31	to 15.80
Basic pig iron (a):				
Belgium	3 3		15.31	
France	3 3		15.31	
Luxemburg	3 3		15.31	
Coke	0 18		4.37	
Billets:				
Belgium	5 2		24.78	
France	5 2		24.78	
Merchant bars:				
Belgium	6 4		1.37	C. per Lb.
France	6 4		1.37	
Luxemburg	6 4		1.37	
Joists (beams):				
Belgium	5 4		1.15	
France	5 4		1.15

Sheets, heavy:				
Belgium	6 1		1.33	
Germany	6 1		1.33	

(a) Nominal.

stocks available, so that prices are firm. It is difficult to obtain prices on blooms, but sheet bars are quoted at £5 2s. (\$24.79) per ton. Billets are commanding £5 3s. (\$25.03) per ton for 2½-in. and £4 19s. (\$24.06) per ton for 3-in., with only small tonnages available.

Finished Material.—Although mills are asking advances on most products because of the German lockout, steel bars alone have registered a definite advance in price. Buyers are withholding business as much as possible, but the volume of tonnage that must be placed is providing considerable activity. Deliveries are extending, and some mills with heavy tonnages booked have practically retired from the market. Sellers seeking business are quoting bars at £6 5s. to £6 6s. per ton (1.38c. to 1.39c. per lb.), and deliveries extend into February and March. Angles are also in good demand and show a tendency to advance, but beam prices are unchanged, with delivery terms shorter than on other products. Medium-size angles are quoted at £5 18s. per ton (1.30c. per lb.), and ordinary specifications of beams, at £5 2s. 6d. per ton (1.13c. per lb.). Corrugated reinforcing bars are firm at £6 7s. per ton (1.40c. per lb.), and hot-rolled hoops, at £6 5s. per ton (1.38c. per lb.). Heavy-gage sheets are firmer, medium gages are inactive with prices unchanged and the light gages, affected by British competition, show a tendency to decline in price.

Europe Expects Sharp Competition in Aluminum

HAMBURG, GERMANY, Nov. 10.—Aluminum producers in Germany are concerned over the possibility of severe price competition next year. The Aktieselskabet Haugvik Smeltwerk, Gromfjord, Norway, is the only important aluminum producer not a member of the international cartel. Recently British interests have acquired the plant and are understood to be increasing its production to a total of 4000 to 5000 tons a year. The company has begun to offer aluminum at less than the cartel price of £95 per ton (20.94c. per lb.), but with only a small output at present has not had much influence on the market. It is estimated that during 1929 this producer will be able to offer close to 4000 tons for export. Its Continental business has been placed in the hands of agents in Switzerland and Germany.

Consumption of the major non-ferrous metals in Germany has almost attained its 1913 level of 760,000 tons, ranging now from 740,000 to 750,000 tons annually of copper, lead, zinc, aluminum, tin and nickel, according to a report received by the Department of Commerce from Trade Commissioner W. T. Daugherty, Berlin.

Steel Imports Are Small

European Mills Quoting Higher Prices Here Than in Other Markets—Japan Asks for Heavy Rails

NEW YORK, Nov. 27.—Importers in New York are offering European steel from stocks, but at present prices are unable to place any further orders with European mills. German producers of strip steel, hoops and bands are evidently willing to quote, but their prices are high and importers are unwilling to risk possible delays in delivery, which might be caused by the German lockout. Importers who are also exporters of both foreign and domestic steel point out that in recent weeks prices obtained from Continental mills have been several dollars a ton higher than quotations on the same specifications for shipment to other foreign markets. On a steel bar specification, an importer in New York recently asked a Continental mill for prices, c.i.f. New York; Buenos Aires, Argentina, and Shanghai, China. The price for delivery to New York was on a \$4 a ton higher basis than to the other two markets.

The United States Court of Customs Appeals has affirmed the judgment of Justice Fischer, sitting in Customs Court, who decided last February that reinforcing bars were to be classified as construction material, taking a duty of 20c. per 100 lb., instead of as bars, which are

dutiable at 30c. per 100 lb. This decision, unless appealed by the Government to the United States Supreme Court, which is not considered likely, will result in considerable refunds on duties paid by importers on reinforcing bars since Justice Fischer's decision. Importers have protested the decision of the Treasury Department classifying bar-sized shapes as bars, because they are produced on a bar mill, and a hearing is expected in the next few months.

Export trade with the Far East continues rather small. There are occasional inquiries for small lots of tin plate from both Japanese and Chinese merchants, and a large Japanese fishing interest is reported to have closed on about 50,000 base boxes of canners' tin plate. The export prices of American mills are substantially unchanged at \$5.20 to \$5.25 per box, c.i.f. Japanese port.

Two large inquiries for heavy rails from Far Eastern railroads are in the market, but the business is expected to go to Continental or Japanese producers. The South Manchuria Railway Co. is inquiring for 25,000 tons of 75 and 100-lb. rails, and the Nankai Electric Railway, in Japan, is taking bids on 16,000 tons of 80 and 100-lb. sections.

German Imports of Advertised American Machinery Large

HAMBURG, GERMANY, Nov. 10.—Germany is a substantial market for certain types of American machinery and equipment. In the first nine months of this year German imports of machinery of all kinds totaled 135,000,000 m. (\$32,175,000). In certain machines the United States furnished nothing and in other equipment the majority of imports were of American origin. Book printing, paper making and sugar mill machinery imports from the United States were of little consequence, most of this equipment coming from Great Britain and Sweden. In agricultural machinery, however, the United States occupies a satisfactory position. Of a total of 115 tractors imported in the first nine months of the year the United States furnished only a few, but of 1634 plows brought into Germany, 65 per cent were from the United States and 16 per cent from Canada. In harvesting machines, imports of which in the first nine months totaled 5460 pieces, only 25 per cent were from the United States and 68 per cent were from Canada.

The difference in the volume of imports of such machines is not so much in price as in adequacy of representation. American, Canadian and Ger-

man prices on agricultural machinery are about the same, but while American made plows are advertised and sold by local agents in 97 German towns, American harvesting machines are sold by only 38 agents and tractors in only six German towns. The result in volume of business seems to be in proportion to the amount of local representation. American manufacturers of typewriters furnished 13,772 of a total of 15,518 imported in the first nine months of the year. German makers, however, exported 54,396 typewriters in this period. Of total imports of 11,438 business machines for offices, the United States furnished Germany with 8531 in the first nine months.

In this period the United States furnished 51 per cent of 1645 internal combustion engines, 53 per cent of 1087 motor-driven sewing machines, 33 1/3 per cent of 3528 laundry machines, 41 per cent of 7453 fire-fighting machines, 59.8 per cent of 10,950 metal-working tools, 37 per cent of 54 units of coal-washing and sorting machines, 11 per cent of 16,462 blowing and ventilating engines and 57 per cent of 1119 leather-working machines.

The American Institute of Weights and Measures will hold its annual meeting in the rooms of the institute at 115 Broadway, New York, on Thursday, Dec. 6, at 2.30 p. m.

Export Movement Grows Larger

October Total Fourth Highest of Past Seven Years—

Was 50 Per Cent Above Last Year—

Imports Above September

WASHINGTON, Nov. 24.—Rising to 256,870 gross tons, exports of iron and steel products from the United States in October reflected an increase of 28,814 tons or 12.6 per cent over the 228,056 tons exported in September. Imports in October, amounting to 63,880 tons, made a gain of 10.5 per cent over the 57,782 tons imported the preceding month. For the 10 months ended with October exports aggregated 2,384,301 tons, or 29.8 per cent above the 1,836,730 tons exported during the corresponding period of last year. Imports for the 10 months of the current year totaled 629,301 tons, or only 0.9 per cent in excess of the 623,922 tons imported during the corresponding period of 1927.

Average daily export movement in October was 8293 tons, against 7602 tons in September and 9268 tons in August. The October daily movement

United States Imports of Iron and Steel Products in October

(In Gross Tons)	
Austria	50
Belgium	10,371
Czechoslovakia	614
France	8,251
Germany	11,985
Italy	317
Netherlands	1,153
Norway	2,060
Sweden	2,570
United Kingdom	12,140
Europe	49,511
Canada	9,725
Mexico	31
British India	4,610
China	3
Total	63,880

was well above the average of 7889 tons for the 10 months of the present year and 6042 tons for the 10-month period of last year. The average

daily import movement in October was 2061 tons, against 1926 tons in September, 2063 tons for the 10 months of 1928 and 2052 tons for the corresponding period of 1927.

Total exports were the fourth highest this year and were above those for any month in 1922 to 1927, inclusive. Exports of rolled and finished material were the third highest of the year and were exceeded only once (January) in 1927. Semi-finished steel exported made the greatest tonnage since May, 1920. Structural steel exports were the heaviest in over five years.

Principal Export Items

Increases in the export movement in October were made in all but three classes. The largest item was scrap, with a total of 39,413 tons, of which 25,650 tons went to Japan and 11,741

Exports of Iron and Steel from the United States

tons to Canada. Scrap exports, however, were 19,098 tons below the 58,511 tons exported in September. Plain structural shape exports increased by 12,470 tons, amounting to 25,847 tons as compared with 13,377 tons. Of the exports of plain material exported in October Canada took 23,015 tons. Outgoing shipments of boiler tubes and welded pipe in October amounted to 24,931 tons, an increase of 7948 tons over the 16,991 tons exported in September.

Of the 12,987 tons of casing and oil line pipe exported in October, 4450 tons went to Venezuela, 2271 tons to the Dutch West Indies, 1858 tons to Argentina and 966 tons to Colombia. Of the 6085 tons of welded black pipe exported that month, 1421 tons went to the United Kingdom, the remainder being widely distributed. Exports of plates in October, amounting to 16,264 tons, made a gain of 5467 tons over the 10,989 tons exported in September; Canada took 12,972 tons. Of the 16,264 tons of steel bars exported in October, an increase of 4479 tons over the 11,785 tons exported in September, Canada took 11,133 tons.

Galvanized steel sheet exports in October, amounting to 13,046 tons, reflected a gain of 4345 tons over the 8701 tons exported in September. Brazil took 2582 tons, Canada 1927 tons and the Philippine Islands 1514 tons. Of the 14,258 tons of black steel sheets exported in October, 7429 tons went to Canada, 2940 tons to Japan and 1375 tons to Italy. Exports of black steel sheets in September were 12,038 tons, a decrease of 2220 tons under those for October.

Tin plate exports in October, amounting to 18,180 tons, showed a gain of 2709 tons over the 16,471 tons exported in September. Of the October shipments, Japan took 4176 tons; China, 2788 tons; Canada, 2319 tons; Argentina, 2129 tons; Brazil, 1281 tons; Peru, 1011 tons.

Of the 21,885 tons of ingots and semi-finished material exported in October, Canada took 20,802 tons, made up of 16,234 tons of skelp and

4568 tons of ingots. Exports of steel rails in October declined to 9347 tons from 16,466 tons in September. Of the October shipments, Canada took 3355 tons; Brazil, 1341 tons; Mexico, 1206 tons; Cuba, 973 tons, and Argentina, 616 tons.

Canada, as usual, was by far the largest consumer of American exports, taking 113,008 tons in October. Japan ranked second, with 47,894 tons, while Argentina was third, with 10,126 tons.

Main Import Items

Pig iron constituted the largest item of importation in October, incoming shipments amounting to 14,108 tons, of which 7702 tons came from the United Kingdom. Of the 4759 tons of steel bars imported in the month, 2105 tons came from Germany and 1217 tons from Belgium, usually the largest supplier of steel bar imports. Of the 10,530 tons of structural shapes imported, 6301 tons came from Belgium, 3069 tons from Germany and 1004 tons from France.

Of the 3838 tons of cast iron pipe imported, 3481 tons came from France. Soviet Russia supplied 12,600 tons of the 26,142 tons of manganese ore imported, while 6469 tons came from Brazil and 6273 tons came from India. Of the 4039 tons of ferromanganese imported, 1760 tons came from Norway, 1653 tons from Canada and 420 tons from the United Kingdom. Of the 4796 tons of tubular products, other than cast iron pipe, imported in October, 2966 tons came from Germany.

Great Britain led as the source of October imports, supplying 12,140 tons; Germany was second, with 11,985 tons, and Belgium third, with 10,371 tons.

Scrap imports were the largest for any month in two years. Imports of finished and rolled material were, with the exception of those in July, the smallest for any month since November, 1927. Steel bars came in in the lightest amount since March, 1926. Structural steel imports were the smallest since February, 1927.

Lower Imports of Iron Ore in October

WASHINGTON, Nov. 24.—Imports of iron ore in October declined to 169,902 tons from 211,494 tons in September, Chile supplying 91,000 tons of the October total and French Africa 41,500 tons. For the 10 months ended with October iron ore imports were 2,057,103 tons, against 2,289,312 tons for the corresponding period of last

year. Chile led by far as the source of these imports for both periods, furnishing 1,170,100 tons during the 10 months of the current year and 1,166,400 tons for the corresponding period of last year.

Owing largely to the strike in Sweden, the 10-month 1928 total from that country, 19,614 tons, was less than 9 per cent of the 1927 shipments. Shipments from Cuba fell off 63,000 tons, while those from Canada showed an advance of nearly 29,000 tons.

Machinery Markets and News of the Works

Heavy Machine Tool Buying

Wright Aeronautical Corporation Orders About \$350,000
Worth and Eaton Axle & Spring Co.'s Purchases
Total About \$300,000

HEAVY buying of machine tools featured the business of the past week. Outstanding were the orders of the Wright Aeronautical Corporation, Paterson, N. J., totaling \$350,000 or more, and those of the Eaton Axle & Spring Co., Cleveland, amounting to \$300,000. The latest purchases by the Wright Aeronautical Corporation bring its expenditures for machine tools in the past several months to at least \$1,000,000 and are part of a program of plant expansion begun early in the year. The Eaton company's purchases are to equip a new plant which will manufacture motor truck axles.

Other orders and inquiries received during the week were of such size as to command unusual attention. R. Hoe & Co., New York, printing press manufacturers, bought 10 milling machines and four planers; a company in the Detroit district has ordered about \$50,000 worth of special lathes, and the National Acme Co., Cleveland, booked a \$100,000 order for 10 machines to be shipped to Sweden. In-

cidentally, this order came from Sweden by telephone. Among pending purchases are \$500,000 worth of equipment for a Detroit automobile company for the manufacture of crankshafts, a list of 21 tools, on which prices are being submitted by Chicago dealers, and 12 turret lathes for a large metalworking plant in Sweden. An automobile company in the East which will build a car of foreign design is also in the market for considerable equipment.

While machine tool business has been on the downward trend this month, the orders of the past week will lift the sales records of companies which benefited to a level that probably will compare favorably with October totals. The high level of activities does not affect all machine tool companies alike; some are so busy that they cannot make early deliveries even by working night shifts, while others are engaged at considerably below capacity. Those making special high production tools are in most cases taxed to their utmost.

New York

NEW YORK, Nov. 27.—Extensive purchasing of tools by the Wright Aeronautical Corporation, Paterson, N. J., was a feature of the past week's machine-tool business in this district. For the second time this year, the Wright company bought upward of \$350,000 worth of equipment. The latest list included 21 milling machines, 28 small turret lathes, 15 sensitive radial drills, 12 grinders, 15 single and multiple drill presses, 2 Mult-Au-Matics, 4 crankshaft lathes. The Curtiss Aeroplane & Motor Corporation, Buffalo, continues a small buyer of machine tools for its plant at Buffalo. R. Hoe & Co., New York, have closed on 10 milling machines and four planers and the Bethlehem Shipbuilding Corporation has bought four lathes for its Fore River shipyard. The General Electric Co., Schenectady,

N. Y., has closed on a large lathe for use at Schenectady and a number of tools for Bloomfield, N. J., including turret lathes and drills.

A list of 16 tools has been sent out for bids by Department of Public Instruction, Albany, N. Y. The inquiry consists of two 14-in. x 6-ft. thread cutting lathes, three 11-in. x 5-ft. thread cutting lathes, two 11-in. x 5-ft. South Bend thread cutting lathes, two 9-in. x 4-ft. bench lathes, one universal milling machine, one 16-in. shaper, one 18-in. vertical drill, one sensitive drill, one universal grinder, one Peerless power hack saw, one portable electric drill, a Buffalo forge and blower, Stewart gas furnace and an anvil.

Sales reported the past week by Pratt & Whitney Co. include a deep hole drill, 14-in. vertical surface grinder, 6-in. and 10-in. thread milling machines, two No. 2 jig borers, 6-in. vertical shaper, 13-in. lathe, special Sigourney drill. Sales by Niles-Bement-Pond Co. included two 48-

in. Niles carwheel borers, 8-in. Williams pipe machine, No. 5 Grand Rapids surface grinder, Nos. 2 and 3 Reid surface grinders, No. 13 Brown & Sharpe universal tool grinder and a 16-in. Niles-Acme shaper.

Bids will soon be asked by Western Electric Co., 195 Broadway, New York, for five-story plant at Emeryville, Cal.; to cost close to \$500,000 with machinery. Pacific Coast headquarters are at 680 Folsom Street, San Francisco. Engineering department of company in charge.

William C. Sommerfeld, 31 Union Square, New York, architect, has filed plans for a five-story automobile service, repair and garage building at 524-28 East Seventy-third Street, to cost about \$160,000 with equipment.

Nichols Copper Co., 25 Broad Street, New York, has plans for addition to plant at Laurel Hill, L. I., one-story, 60 x 275 ft., to cost over \$175,000 with equipment.

Johns-Manville Corporation, Madison Avenue and Forty-first Street, New York, has purchased plants and business of Celite Co., Los Angeles, manufacturer of temperature insulation products, filtration materials, etc., with properties at Lompoc, Cal., and will operate as a division of its business. Plans are under way for increase in output of Celite specialties.

Following recent acquisition of Port Henry Light, Heat & Power Co., Port Henry, N. Y., by New York Power & Light Corporation, Albany, N. Y., last-noted company will carry out expansion program in Madison and Cortland Counties, including transmission lines, power substations, etc., to cost approximately \$800,000.

Phelps-Dodge Corporation, 99 John Street, New York, is completing plans for electrolytic copper refinery at El Paso, Tex., to cost over \$3,000,000 with machinery. Project will include power house and machine shop.

American Aeronautical Corporation, 730 Fifth Avenue, New York, recently organized, has concluded negotiations for American rights for production of Savoia-Marchetti seaplanes and other commercial aircraft, from Italian company of that name. It is proposed to build plant on Long Island, comprising parts manufacture and assembling divisions. Motors will be secured from outside sources. Enea Bossi is one of heads of new company.

Bushwick Can Co., 86 Butler Street, Brooklyn, manufacturer of tin cans, boxes, etc., has plans for one-story factory to cost about \$45,000 with equipment. V. A. Lacerenza, 26 Court Street, is architect.

War Department, Washington, has awarded contract to Asdlen Construction Co., Philadelphia, for group of 38 buildings at Picatinny Arsenal, Dover, N. J., to replace structures destroyed by fire several months ago, at cost of \$793,516.

Gates-Day Aircraft Corporation, East Twenty-fourth Street, Paterson, N. J., has leased mill on East Sixteenth Street, totaling about 35,000 sq. ft. floor space, and will remodel for new plant unit. Present works will be continued.

Truscon Steel Co., Youngstown, Ohio, is

The Crane Market

NEW inquiry for overhead traveling cranes continues slack, but there is some substantial business in the market, expected to be placed before the end of the year. Fox Brothers International Corporation, New York, has been asking for prices on 17 special "automobile cranes" for export. Business in locomotive cranes is quiet, but New York subway contractors have appeared in the past week as buyers of short boom shovels for tunnel work. Western Electric Co., Chicago, is in the market for a 10-ton crane for its cable plant.

Among recent purchases are:

Morse-Rogers Steel Co., Glendale, L. I., 5-ton, 67-ft. 6-in. span, 3-motor, overhead crane, reported purchased from Milwaukee Electric Crane & Mfg. Corporation.

Rosenthal Engineering Contracting Co., 12 East Forty-first Street, New York, two short boom shovels for tunnel work, from Bucyrus-Erie Co.

Philip J. Cogan, contractor, New York, two short boom shovels for tunnel work, reported purchased from Bucyrus-Erie Co.

Carnegie Steel Co., two 15-ton, 31-ft. 4-in. span double line bucket cranes for Duquesne Works, to Alliance Machine Co.

Oscar Daniels Co., a 22-ton, standard gage, steam operated, rebuilt railroad crane from Orton Crane & Shovel Co.

Acme Steel Co., Chicago, has ordered an overhead electric crane from Whiting Corporation.

Missouri-Pacific has ordered for Falls City, Neb., a 15-ton, 46-ft. span electric crane from Manning, Maxwell & Moore, Inc.

considering one-story factory branch and distributing plant at Harrison, N. J., to cost about \$40,000.

Passaic Valley Sewage Commission, 20 Branford Place, Newark, is considering installation of Diesel oil-burning engines at Newark Bay pumping station to replace present coal-burning equipment. Estimates of cost will be made by Joseph Hecking, 94 Wheaton Place, Rutherford, N. J., combustion engineer.

Public Service Electric & Gas Co., Public Service Terminal, Newark, is reported planning new power switching station at Elizabeth, N. J., to cost more than \$1,000,000 with transmission lines and equipment.

Elevating and conveying machinery, packing and other equipment will be installed in six-story addition, 124 x 200 ft., to plant of Hoffman Beverage Co., 402 Grove Street, Newark, to cost more than \$350,000. Edward C. Eppele, 44 Commerce Street, is architect.

Universal Body Building Co., Inc., 7 Liberty Street, Lodi, N. J., has been organized to build and repair commercial vehicle bodies. Company will be in market for materials and equipment.

Albert & Davidson Pipe Corporation, 256 Oakland Street, Brooklyn, used pipe dealer, has purchased plant, stock, equipment and good will of McMann & Taylor, Second Avenue, Fifty-first and Fifty-second Streets, Brooklyn, and is moving to new quarters on Dec. 1. Plant has 20,000 sq. ft. of floor space, and will provide considerably increased facilities.

Knickerbocker, Cram & Co., 7 East Forty-second Street, New York, have been appointed agents in the New York territory for production and tool room lathes made by Porter-Cable Machine Co., Syracuse, N. Y.

Buffalo

BUFFALO, Nov. 26.—Dunkirk Radiator Corporation, Dunkirk, N. Y., has been organized to manufacture radiators and boilers. Company has acquired property on Middle Road, Dunkirk, and has begun construction of building, 120 x 450 ft.

National Carbon Co., 3625 Highland Avenue, Niagara Falls, N. Y., has taken bids on general contract for one-story addition, to cost about \$50,000 with equipment. Headquarters are at 30 East Forty-second Street, New York.

Stafford & Holt, Inc., Little Falls, N. Y., has been formed with capital of \$100,000 to take over and expand company of same name, with local plant for manufacture of knitting machinery and

parts. New organization is headed by Walter Stafford and James C. Bronner, both of Little Falls.

St. Regis Paper Co., Watertown, N. Y., is concluding negotiations for purchase of controlling interest in Cellulosa Cubana Co., Havana, Cuba, manufacturer of paper goods. Purchasing company plans enlargement of mill of Cellulosa company, as well as construction of new paper mill in vicinity of Havana, entire project to cost more than \$1,000,000. Company recently disposed of stock issue to total about \$11,250,000, portion of proceeds to be used for expansion.

Houdaille Corporation, Buffalo, has been organized to take over and expand Houde Engineering Corporation, 537 East Delevan Avenue, Buffalo, manufacturer of Houdaille hydraulic shock absorbers. New company will be capitalized with 256,000 shares of stock, and will be headed by Claire L. Barnes, also president of Oakes Products Corporation, Indianapolis, manufacturer of automobile specialties. Frederick B. Cooley, president New York Car Wheel Co., Niagara Street, Buffalo, has also secured substantial interest in company.

New England

BOSTON, Nov. 26.—November probably will be the best month experienced by the local machine tool trade since early this year. Few new inquiries are in hand, but dealers still have a sizable number pending that hold promise of early closing. Some New England railroads are expected to be active purchasers of shop equipment in 1929.

During the past week a Massachusetts airport bought 10 machine shop tools, and the Atlantic Works, East Boston, purchased a shaper, a milling machine, one 15-ton and one five-ton crane for its new machine shop, and is expected to close on other equipment this week. A 3-ft. radial drill and a bench milling machine went to Massachusetts manufacturers. In the used tool market several 8-in. lathes, three shapers, two upright drills, a planer and a few screw machines were among those sold to Massachusetts shops.

Charles R. Graco, 11 Beacon Street, Boston, architect, will close bids Dec. 4 on a three-story and basement school, 80 x 200 ft., at Cambridge, to contain a manual training department and to cost \$650,000 with equipment.

Draper Corporation, Hopedale, Mass., textile machinery, has plans for a two-story assembling plant at Spartanburg,

S. C., to contain a small machine shop. J. E. Firrine & Co., Greenville, S. C., are engineers.

Frank Irving Cooper Corporation, 172 Tremont Street, Boston, architect, will close bids Dec. 4 on a two-story, 78 x 104 ft., and one-story 44 x 97 ft. grade schools for Ashland, Mass., to cost \$100,000 without equipment, to contain manual training departments. C. E. Cristman, Framingham, Mass., is chairman of building committee.

Berkshire Sanitary Ice Co., Pittsfield, Mass., is having plans prepared for a 2½-story ice making plant 70 x 115 ft. Miscellaneous equipment is required.

New York, New Haven & Hartford Railroad Co., New Haven, Conn., has plans for one-story repair shop at Dedham, Mass., for sand-blast and other service, 100 x 150 ft., to cost over \$50,000 with equipment.

National Brake Service, Inc., 562 Commonwealth Avenue, Boston, automobile equipment, has leased space in building at 922 Commonwealth Avenue, for new plant.

American Tube & Stamping Co., 766 Stratford Avenue, Bridgeport, Conn., has awarded general contract to T. J. Pardy Construction Co., 1481 Seaview Avenue, for three-story addition, 36 x 100 ft., to cost more than \$65,000 with equipment.

Cornell Multi-Wall Valve Bag Co., East Pepperell, Mass., has awarded general contract to H. L. Shattuck, Inc., South Street, Manchester, N. H., for a one-story unit, 100 x 150 ft., to cost more than \$75,000 with equipment.

Standard Oil Co. of New York, 26 Broadway, New York, has filed plans for an addition to storage and distributing plant at Lowell, Mass., to cost about \$40,000 with equipment.

Hanson Whitney Machine Co., Inc., 169 Bartholomew Avenue, Hartford, Conn., manufacturer of special machinery, has awarded contract to A. F. Peaslee, Inc., Hartford, for a one-story addition, 50 x 67 ft. Ebbets & Frid, Hartford, are architects.

Philadelphia

PHILADELPHIA, Nov. 26.—Plans are being drawn by I. Fischman & Sons, Tenth Street and Allegheny Avenue, Philadelphia, manufacturers of soda water equipment, for a one-story addition, to cost about \$40,000 with machinery. Clarence E. Wunder, 1520 Locust Street, is architect.

Karl F. Otto, 1828 Arch Street, Philadelphia, architect, has filed plans for a two-story automobile service, repair and

garage building, to cost over \$100,000 with equipment.

William R. Rorer, 1120 Harrison Street, Philadelphia, and associates have organized Columbia Welding Co. to operate a machine and welding works, and will begin production soon. Edward A. Lynch, 2516 South Twenty-second Street, is also interested in new company.

Machine shop and tools, buildings and real estate of Trexler Co. of America, Inc., Wilmington, Del., will be offered at a public sale Dec. 5, by Delaware Trust Co., Wilmington, trustee for creditors.

Blackmer Pump Co., Grand Rapids, Mich., has leased property at Delaware Avenue and South Street, Philadelphia, in Bailey warehouse group, for local factory branch and distributing plant.

Thomas Halton's Sons, Mascher Street, Philadelphia, manufacturers of silk mill machinery, have plans for one-story machine shop, 69 x 240 ft. W. E. S. Dyer, Land Title Building, is architect and engineer.

Bridgeton Sand Co., Bridgeton, N. J., plans rebuilding power house and glass sand producing plant at Berlin, partly destroyed by fire Nov. 21. Adjoining glass sand plant of Pennsylvania Pulverizing Co. was also damaged and will be rebuilt. Headquarters of latter company are at Lewistown, Pa.

Board of Education, Camden, N. J., is considering installation of manual training equipment in new Woodrow Wilson junior high school, East Camden, to cost over \$500,000, for which bids will be received on general contract on Dec. 6. Davis, Dunlap & Barney, 1805 Walnut Street, Philadelphia, are architects.

Scranton School District, 425 Washington Avenue, Scranton, Pa., has awarded contract to R. D. Richardson Construction Co., Connell Building, for central power plant at Adams Avenue and Gibson Street, to cost about \$230,000 with equipment.

Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, has plans for new coal breaker at Locust Summit, Pa., to cost more than \$500,000 with equipment.

International Coal Combustion Co., operated by International Combustion Engineering Corporation, 200 Madison Avenue, New York, has closed contract for supply of gas to Lukens Steel Co., Coatesville, Pa., and will soon begin construction of low temperature coal carbonization plant. Power plant will have initial capacity of about 1,750,000 cu. ft. daily, with ultimate output of about twice that amount. Completion is scheduled early in 1930.

Bellanca Aircraft Corporation, New Castle, Del., has disposed of stock issue to net close to \$2,000,000, considerable portion of fund to be used for expansion at local plant. Company will also provide for manufacture of new types of commercial airplanes.

St. Louis

ST. LOUIS, Nov. 26.—Emery-Carpenter Container Co., June and Long Streets, Cincinnati, manufacturer of fibre shipping drums and other fibre products, has leased part of building at 2731 Papin Street, St. Louis, for branch plant. Machinery installation will cost over \$40,000. St. Louis offices are at 705 Olive Street.

American Eagle Aircraft Corporation, 2800 East Thirteenth Street, Kansas City,

Mo., E. E. Porterfield, Jr., head, has asked bids on general contract for new plant in Fairfax industrial district, consisting of two buildings, one-story, 100 x 300 ft., and two stories, 30 x 70 ft., to cost over \$80,000 with equipment. Chester E. Dean, Reliance Building, is architect.

St. Louis Body Equipment Co., St. Louis, manufacturer of automobile bodies, has begun construction of one-story plant at Forest Park Boulevard and Sarah Street, totaling 15,000 sq. ft. floor space, to cost about \$35,000 with equipment. I. O. Boardman is president.

Always-A-Head Mills, Inc., Thirty-fifth Street, East St. Louis, Ill., has awarded general contract to Humphries Contracting Co., Pierce Building, St. Louis, for six-story flour mill, 60 x 142 ft., with grain elevators of 40,000 bu. capacity, to cost over \$250,000. Equipment will include elevating, conveying, screening and kindred machinery.

W. S. Frank, Century Building, St. Louis, architect, is completing plans for three-story automobile service, repair and garage building, 70 x 175 ft., reported to cost about \$115,000 with equipment.

Swallow Airplane Co., Wichita, Kan., has arranged for sale of stock to total \$360,000, fund to be used for expansion, including new buildings and equipment for production of biplanes and parts. William B. Moore is president.

Marshall Supply Co., Inc., Pittsburg, Kan., and Tulsa, Okla., has been appointed distributor in that territory for refractory materials manufactured by Botfield Refractories Co., Philadelphia.

St. Louis Southwestern Railway is in the market for a heavy-duty, motor-driven, coach wheel lathe, capacity to handle carwheels, trailer wheels, engine and tender truck wheels for its shops at Pine Bluff, Ark., and a driving motor-driven wheel lathe with capacity to turn tires up to 86-in. tread diameter, for shops at Tyler, Tex.

Cincinnati

CINCINNATI, Nov. 26.—While some machine tool builders report that the trend of sales has been slightly downward this month, a few important companies have had gains as high as 25 per cent above October volume. In the aggregate, however, bookings in the local market have fallen a little short of those in October, although orders still remain far above what has been regarded as normal in the past few years. The liberal amount of inquiries before the trade gives promise of a continuation of good business during the remainder of the year and no sharp let-down from the present high average is yet in sight.

The matter of deliveries is giving some concern to Cincinnati machine tool plants, some of which are finding it necessary to operate night shifts to take care of current orders. Unfilled bookings which have accumulated recently give assurance of the maintenance of production on the present scale until after the first of the year, at least. That the high level of activities does not affect all machine tool companies is a fact worthy of note. Plants turning out special high production tools are taxed to capacity, whereas, those shops devoted to standard equipment, especially to large tools, are less busy. However, there has been an increase in sales of tools of the latter type in the past two weeks.

Pending business in the automobile in-

dustry is of large volume. A prominent Detroit maker is negotiating for the purchase of special machines costing close to \$500,000, while a foreign automobile company is expected to buy a large number of tools. A company in the Detroit district has closed for about \$50,000 worth of special lathes. Included in purchases of the past 10 days are lathes, drilling machines and other equipment for Eastern airplane motor manufacturers. Missouri Pacific Railroad has placed an order for three engine lathes with a local builder.

G. & G. Mfg. Co., Cincinnati, stamp and die maker, has purchased a building at 2116 Colerain Avenue and will transfer operations to new plant.

Aeronautical Corporation of America, Cincinnati, has been incorporated to manufacture airplanes, airplane motors and other airplane parts, and will construct a plant, 100 x 300 ft., at Municipal Airport. C. G. Dietz, formerly of Dayton, Ohio, will be in charge.

C. Heckel and C. A. Klump have taken over management of Charles A. Taylor Mfg. Co. and E. Conner Machine Co., 120 Opera Place, Cincinnati, and now are operating as H. & K. Machine Co.

Bids will soon be asked by Columbus Heating & Ventilating Co., 425 West Town Street, Columbus, Ohio, for three-story factory, to cost about \$40,000 with equipment.

Walter E. Schott Co., 2340 Gilbert Avenue, Cincinnati, automobile dealer, has plans under way for five-story service, repair and sales building, to cost about \$150,000 with equipment.

National Cash Register Co., Dayton, Ohio, is concluding arrangements for purchase of plant and business of Ellis Adding Typewriter Co., 338 Elizabeth Avenue, Newark, N. J., and will operate as division of National company. Expansion program is planned for manufacture of Ellis type machines.

Goodyear Tire & Rubber Co., Akron, Ohio, has plans for one-story factory branch and distributing plant, 65 x 190 ft., at Knoxville, Tenn., to cost about \$85,000 with equipment. Ryno & Brackney, Brownlow Building, Knoxville, are architects.

Plans have been arranged for merger of Fairbanks Co. and O. S. Kelly Co., both manufacturers of piano plates and kindred castings, with plants at Springfield, Ohio. An expansion program will be carried out. M. L. Milligan, heretofore president of Fairbanks Co., will head consolidated organization.

Board of County Commissioners, Court House, Cincinnati, is said to be planning construction of one-story foundry, shop and power house for County equipment, to cost more than \$200,000 with machinery.

Detroit

DETROIT, Nov. 26.—Contract has been let by Machine Specialty Co., Main Street, Pontiac, Mich., to Austin Co., Detroit, for two-story and basement unit, 38 x 100 ft., to cost about \$45,000 with equipment.

Fisher Body Corporation, Detroit, is planning an expansion program at Pontiac plant, including new buildings and installation of additional equipment, to cost about \$750,000.

Evans Auto Loading Co., Dime Bank Building, Detroit, manufacturer of automobile loading devices, has acquired plant and business of Western Lumber Mfg. Co., Marshfield, Ore., for expansion

for production of battery boxes and battery separator plates.

Stinson Aircraft Corporation, Northville, Mich., is having plans drawn for one-story addition, to cost about \$150,000 with equipment. F. J. Winter, Book Building, Detroit, is architect.

City Commission, Pontiac, Mich., has approved purchase of 80 acres for expansion at municipal airport, providing total of 240 acres, to include construction of new hangars, repair shops and other facilities.

Re-Nu Corporation, a subsidiary of Borg-Warner Corporation, Holland, Mich., operating O. E. Szekely Corporation, manufacturer of automotive equipment, has acquired a building on Eighth Street for production of piston rings, with initial output of about 1,000,000 per month. Later plant will be built for Re-Nu organization, as well as Szekely company and other interests.

Goddard & Goddard Co., 4724 Hastings Street, Detroit, manufacturer of tools, etc., is planning one-story addition, to cost about \$100,000 with equipment.

Square D Co., 6060 Rivard Street, Detroit, manufacturer of electrical switches, etc., has awarded general contract to W. E. Wood Co., Ford Building, for three-story addition, to cost about \$115,000 with equipment.

Federal Steel Corporation, Detroit, has awarded a general contract to Austin Co. for one-story addition to storage and distributing plant, with overhead traveling cranes and other handling facilities, to cost over \$60,000; company will also erect a new office building.

Gorham Tool Co., 2206 Twelfth Street, Detroit, has plans for one-story unit, 120 x 125 ft., to cost more than \$75,000 with equipment. Bids will soon be asked by Lane, Davenport & Peterson, Charlevoix Building, architects.

Cleveland

CLEVELAND, Nov. 26.—Machine tool business came out in heavy volume the past week. The Eaton Axle & Spring Co., Cleveland, purchased \$300,000 worth of machinery for a new local plant under construction for the manufacture of motor truck axles. Nearly one-third of this amount covered boring and drilling machinery that was placed with a Cleveland dealer. The remainder was largely special production machinery.

National Acme Co., Cleveland, took an order for ten of its largest automatic 3 5/16 in. 4-spindle machines for a metal-working plant in Sweden. This order, amounting to \$100,000, was placed by the Aktiebolaget Servus machinery agency, and was transmitted by telephone from Sweden to the Windsor, Vt., plant of the National Acme Co. Another Swedish company has an inquiry out for 12 turret lathes.

Reports from abroad indicate that some European machinery users are selling their old machine tools to Russia and replacing them with more modern American machinery. Other orders placed with Cleveland manufacturers during the week included six turret lathes by the Wright Aeronautical Corporation, Paterson, N. J. Increased activity the past week has brought November sales well ahead of October. Deliveries of some lines are becoming more extended.

Geometric Stamping Co., 221 East 131st Street, Cleveland, will erect a new plant

that will largely increase its capacity. Plans for first unit, 250 x 600 ft., are being prepared by Austin Co. Other units to be built later will increase the floor space to 600,000 sq. ft. Company manufactures automobile stampings and other pressed steel products.

Gluntz Brass Co., Cleveland, has purchased plant formerly occupied by K. & M. Brass & Aluminum Castings Co., on Harvard Avenue, which includes 16,000 sq. ft. of floor space occupied by foundry and finishing departments. Gluntz company will erect a one-story machine shop, 60 x 100 ft.

Central Wire Nail & Specialty Co., Cleveland, has been organized to manufacture airplane wire and special nails for automotive and airplane industries, and has taken over the plant of Brightman Machinery Co., East Seventy-first Street and Quincy Avenue, containing 20,000 sq. ft. of floor space. New equipment will be installed and it is expected plant will be ready for operation about Jan. 1. Officers are John J. Sullivan, Jr., president; John B. Ritchey, vice-president and W. H. Thomas, treasurer, all of whom have been connected with Stronach Nail Co., Pittsburgh.

Chase Brass & Copper Co., Bridgeport, Conn., which will erect a plant in Cleveland to supply its Western trade, has acquired a 60-acre site on Babbitt Road and New York Central and Nickel Plate Railroads. Contract for first unit has been placed with Austin Co. It will be 225 x 1000 ft., one floor, but equivalent in height to a three-story building. Several 5 and 10-ton electric traveling cranes will be required.

Murray Ohio Mfg. Co., Cleveland, maker of automobile stampings and all steel toys, will erect an addition. Company is offering \$1,000,000 of 10-year, 6½ per cent sinking fund gold debentures, proceeds of which will be used for retirement of a \$250,000 mortgage and \$307,300 of 8 per cent preferred stock and toward the cost of plant extension.

Kelley Reamer Co., 3705 West Seventy-third Street, Cleveland, is considering one-story addition, to cost more than \$35,000 with equipment.

General Tire & Rubber Co., 1709 Market Street, Akron, Ohio, has awarded general contract to C. W. & P. Construction Co., Second National Bank Building, for two and four-story addition, to cost \$200,000 with equipment.

Cleveland Automatic Machine Co., 2269 East Sixty-fifth Street, Cleveland, manufacturer of machine tools, etc., is considering plans for one-story plant at Elyria, Ohio, totaling 175,000 sq. ft. floor space, to cost more than \$250,000 with equipment. Company is said to be planning removal of present works to new location and concentrating production there. H. W. Ruppel is general manager.

Industrial Steel Casting Co., Millard Avenue, Toledo, Ohio, has awarded general contract to Comte-Naumann Co., 912 Summit Avenue, for one-story addition, 140 x 175 ft., to cost over \$180,000 with equipment.

City Ice & Fuel Co., 6611 Euclid Avenue, Cleveland, is arranging expansion program in ice-manufacturing and cold storage plants to cost approximately \$1,500,000 with equipment, including addition to plant on Union Avenue, S. E.; additional coal-handling facilities at yard at Payne Avenue and East Fortieth Street; new plants at Willoughby and Hilltop, Columbus, Ohio; electrification and enlargement of ice plant at Norwood, Cincinnati; new plants at Westwood, near Cin-

cinnati, and at Fort Thomas, Ky.; addition to Inwood plant, New York; ice plant at Troy, N. Y.; and two new car-icing plants in South and Middle West. Company has recently acquired Lexa Ice Co., Lexa, Ark., and plans expansion at that place.

Chicago

CHICAGO, Nov. 26.—The situation in the local machine tool market is little changed from a week ago. Some sellers find the volume of purchases well sustained while others report a gradual decline in orders. Many buyers are studying their expenditures for the year now closing, and much of the pending business will probably be deferred until early in 1929.

A number of buyers, including the railroads, are looking forward to budget requirements for next year and are asking for preliminary figures. This action, especially on the part of the railroads, is looked upon with satisfaction by dealers who this year derived little business from that source. Greater interest is noted among manufacturers of road building machinery. One list for 21 tools is now before the trade and another sizable request for prices is expected soon. Several lines of boring mills and grinders have been advanced in price. An engineering firm in Chicago has ordered a 20-in. x 10 ft. geared-head lathe.

Caspers Tin Plate Co., 3414 West Forty-eighth Place, Chicago, will build a factory 100 x 350 ft., to cost \$100,000. A. Epstein is engineer.

Victor Mfg. & Gasket Co., 5701 Fillmore Avenue, Chicago, will erect a seven-story brick addition to cost \$150,000. Frank D. Chase is architect.

American Pneumatic Cleaning Co., 1035 West Lake Street, Chicago, will build an addition, 125 x 125 ft., to cost \$35,000.

Elgin Stove & Oven Co., North State Street, Elgin, Ill., is considering one-story addition, 50 x 135 ft., to cost over \$60,000 and will begin work next year.

Illinois Tool Works, 2501 North Keeler Avenue, Chicago, has awarded general contract to Joseph Haigh & Sons, 140 South Dearborn Street, for one-story addition, to cost about \$35,000. Puckey & Jenkins, 400 North Michigan Avenue, are architects.

Atomized Fuel Corporation, Fort Dodge, Iowa, will soon take bids for new one-story plant for special fuel production, to cost about \$75,000 with machinery. F. W. Griffith, Snell Building, is architect. Pennsylvania Engineering Co., New Castle, Pa., is engineer.

All-Steel Equipment Co., Aurora, Ill., is arranging for early construction of one-story addition, to cost about \$27,000 with equipment. Herbert E. Spieler, Graham Building, is architect.

Minnesota Valley Canning Co., Montgomery, Minn., plans installation of boiler equipment, stokers, deep-well pumping machinery and motor-driven factory equipment in new unit to cost about \$85,000. Ralph W. Richardson, Zenith Building, St. Paul, Minn., is engineer.

City Council, Ottumwa, Iowa, is planning municipal hydroelectric generating plant on Des Moines River, to cost close to \$750,000, with transmission and distributing lines. Brown & Cook, 106 North Market Street, are consulting engineers.

Storkline Furniture Corporation, 4400 West Twenty-sixth Street, Chicago, is hav-

ing plans drawn for one-story addition, to cost \$160,000 with equipment. R. B. Kurzon, 105 West Monroe Street, is architect.

Imblum Aeronautical Co., 430 West Fifth Street, Pueblo, Colo., has plans for new plant, including parts production and assembling departments, to cost about \$200,000 with machinery. Work will begin early next year.

Central West Public Service Co., Omaha, Neb., operating Consumers Ice Co., Sioux City, Iowa, is considering new one-story ice-manufacturing plant at last noted place, to cost about \$125,000 with machinery.

Gulf States

BIRMINGHAM, Nov. 26.—Contract has been let by Missouri, Kansas & Texas Railroad Co., St. Louis, to T. H. Johnson, 107 South Ohio Street, Sedalia, Mo., for new engine house and locomotive repair shop at Smithville, Tex., to cost more than \$125,000 with equipment.

Cabell Electric Co., Jackson, Miss., electric equipment, has plans for a two-story and basement storage and distributing plant, 42 x 60 ft.

Conveying machinery, refrigerating equipment, mechanical mixers and other apparatus will be installed in new powdered and evaporated milk plant to be constructed at Waco, Tex., by Borden Co., 350 Madison Avenue, New York, to cost about \$400,000. A power house is planned.

Southeastern Power & Light Co., Birmingham, operating Alabama Power Co., and other public utilities, has organized a new subsidiary to carry out project for new steam-operated electric generating plant at Mobile, Ala., referred to under last-noted name in this column last week. New interest will be known as Southeastern Production Co., and will begin work at once. Station will have initial capacity of 10,000 hp., and ultimate cost is placed at \$1,300,000. Dixie Construction Co., another subsidiary, will be in charge of erection.

City Commission, Tyler, Tex., is planning establishment of municipal airport, to include hangar, repair shop and other units. A portion of bond issue of \$250,000, now being arranged, will be used for project.

Kelley Stove & Range Co., Leeds, Ala., recently formed by R. J. Kelley, Leeds, and associates, has begun superstructure for main unit of plant, 150 x 300 ft.

Southern Water Heater Co., Los Angeles, is reported contemplating new plant for parts manufacture and assembling at Houston, Tex., to cost over \$65,000 with equipment.

City Council, Fort Worth, Tex., has acquired tract of about 50 acres for enlargement of municipal airport, to include construction of hangars, shops and other buildings.

American Battery Products Co., Wichita Falls, Tex., is considering construction of new one-story plant, to cost more than \$25,000 with equipment.

Masonite Corporation, Laurel, Miss., manufacturer of structural insulating board, has begun construction of third unit at local plant, to increase capacity close to 400,000 ft. of material per day, to be one story, to cost more than \$90,000 with equipment. High pressure boiler equipment, pumping and other machinery will be installed in power department. Company has also secured license for operation of mill in Sweden, and contemplates erection of a plant in that country during coming year.

Davison-Pick Fertilizer Co., Whitney Street, New Orleans, a subsidiary of Davison Chemical Co., Garrett Building, Baltimore, has begun work on first unit of new mill on 15-acre site at Orange, Tex., to cost more than \$100,000 with machinery. Other units will be built later, entire project to cost more than \$300,000.

Texas Corporation, Houston, Tex., is said to have concluded arrangements with Louisiana Land & Development Co. for lease of portion of company lands in Louisiana, for development for oil, natural gas and sulphur. Texas company will begin installation of machinery at early date.

South Atlantic

BALTIMORE, Nov. 26.—Continental Roofing Co., Ponca Street and Boston Road, Baltimore, has awarded general contract to Consolidated Engineering Co., 20 East Franklin Street, for one-story addition to cost about \$40,000.

Seaford Boat Works, Seaford, Del., recently organized to take over property of Seaford Marine Railway Co., is remodeling plant to build barges and other vessels.

Pearce-Young-Angel Co., Greenville, S. C., will soon take bids for two-story cold storage and refrigerating plant, 75 x 125 ft., to cost over \$75,000 with equipment. Haskel H. Martin, Vickers Building, is architect and engineer.

Board of District Commissioners, District Building, Washington, is asking bids until Dec. 10 for metal-working and wood-working machinery for new McKinley high school; until Dec. 4 for gate valves for water department.

Celanese Corporation of America, Inc., Amcelle, Md., will take bids at once for one and one-half story turbine plant for local rayon mill, to cost about \$140,000 with machinery. F. T. Small is company engineer.

Herbst Boat Works, Inc., Wilmington, N. C., recently organized by John L. Hammer, 1801 Grace Street, and associates, plans operation of local boat-building and repair works. J. T. Herbst will head new company.

Chemical & Pigments Co., Patapsco Avenue, St. Helena, Baltimore, has plans for three additions, including power house, pigment-mixing unit and storage and distributing plant, to cost over \$85,000 with equipment.

Nardin-Armstrong Corporation, Bedford, Va., H. E. Armstrong, president, manufacturer of tools, dies, steel stampings, etc., has awarded general contract to Overstreet & Overstreet, Bedford, for new plant consisting of two one-story units, 75 x 325 ft. and 40 x 100 ft., to cost about \$80,000 with equipment. C. A. Bielke is construction engineer.

Frigidaire Corporation, Dayton, Ohio, manufacturer of electric refrigerating equipment, has leased three-story building at Spartanburg, S. C., for new factory branch and distributing plant.

Board of Public Improvement, City Hall, Baltimore, C. F. Goob, city engineer, will soon take bids for municipal airport to cost more than \$1,500,000, including hangars, repair and reconditioning shops and other units.

Cathey Lumber Co., 3088 Fifth Street, Charlotte, N. C., John R. Cathey, president, has awarded general contract to Blythe & Isenhour, Brevard Court, for two-story lumber and wood-working mill, and building material plant, to cost \$100,000. Conveying, elevating and other

material-handling equipment will be installed.

Milton E. Marcuse, Jefferson Hotel, Richmond, Va., and associates have organized Rosecliff Development Corporation, to construct and operate a hydro-electric power plant on James River, near Snowden, Va., for which plans have been approved. Initial station will have capacity of 10,000 hp., and will cost more than \$250,000 with transmission lines.

Milwaukee

MILWAUKEE, Nov. 26.—Machine-tool business of most shops this month represents a satisfactory volume, although there was some let-down from the relatively active trade in September and October. Plants are still busy, many at maximum capacity and on overtime schedules to make delivery specifications. New business being received will carry high rate production through December and January, if not longer. Inquiry is also favorable to active future business.

Liberty Foundry Co., Inc., Wauwatosa, P. O. Milwaukee, has acquired McNally-Tollefson Foundry Co., Stoughton, Wis., taking possession Nov. 28. Liberty company also operates Spring City Foundry Co., Waukesha, Wis. These three plants are engaged principally in production of automobile engine cylinders and pistons. Stoughton plant, occupying gray iron foundry of former Moline Wagon Co., now owned by city of Stoughton as an industrial community, is to be acquired from city and additions made for increase in capacity. J. E. McNally, vice-president and general manager, will continue as manager of Stoughton shop. E. M. Tollefson, president, and R. I. Tollefson, secretary, are retiring. William J. Grede is president, and Ralph L. Lee, secretary and treasurer of Liberty company.

Common Council, Manitowoc, Wis., has appropriated \$250,000 for an addition and purchase of new steam or oil engine equipment for municipal light and power plant, having rejected proposals of Wisconsin Public Service Co. for a hook-up with its generating plant for additional capacity. Fred L. Alter is city engineer.

Gillette Rubber Co., Eau Claire, Wis., which is erecting a new mill, 125 x 180 ft., part two stories, will also build a general factory extension, 128 x 200 ft., one story, and a mixing room addition, 49 x 135 ft. Enlargements call for an investment of about \$500,000 and will increase capacity from 6000 tires a day to 10,000.

W. M. Welch Co., Manitowoc, Wis., manufacturer of laboratory furniture, will build an addition to cost over \$50,000. Work is to start about Jan. 1. R. G. Halverson is general manager.

Otto Biefeld Co., 202 North Water Street, Watertown, Wis., founder and machinist, is awarding contracts this week for the erection of a \$25,000 addition to accommodate production it is undertaking under contract with newly organized Henszy De-Concentrator Co., 120 East Wisconsin Avenue, Milwaukee, manufacturer of devices to eliminate scale and corrosion in steam boilers. Arthur Kuenzi is vice-president and production manager.

Burrell Engineering & Construction Co., 513 West Jackson Boulevard, Chicago, has taken general contract to furnish and equip a truck loading plant and warehouse, five stories, 46 x 100 ft., at Milwaukee, for the Petoskey Portland Cement Co., Petoskey, Mich. It will cost about \$80,000.

Partnership of William A. Brooks and Hugo Mastaglio, doing business as Brooks Pattern & Machine Co., Milwaukee, has been dissolved. Business will be continued by Mr. Mastaglio.

Camm-Blades Machinery Co., 610 Michigan Street, Milwaukee, has been appointed agent in Milwaukee territory for Boye & Emmes Machine Tool Co., Cincinnati.

Pittsburgh

PITTSBURGH, Nov. 26.—Inquiries for machine tools and machinery still are numerous, but sales are rather few. There has been no action yet on the lists of the Carnegie Steel Co. and the Westinghouse Electric & Mfg. Co.

Hajoca Corporation, 120 South Thirtieth Street, Philadelphia, manufacturer of plumbing, heating and kindred equipment, has leased property at Lewistown, Pa., for a new factory branch and distributing plant. Present building, totaling about 12,000 sq. ft. floor space, will be remodeled and other units erected.

Fokker Aircraft Corporation, Wheeling, W. Va., has plans for new plant in East Bay District, Oakland, Cal., for parts production and assembling to cost over \$100,000 with equipment. Company will standardize on five models at this plant and at works at Wheeling and Teterboro, N. J., ranging from six-passenger planes to 14-passenger tri-motored aircraft. James A. Talbot, president Richfield Oil Co., Bartlett Building, Los Angeles, is interested in Fokker project on Pacific Coast.

American Window Glass Co., Arnold, Pa., has work under way for expansion, including installation of equipment, to cost more than \$300,000. Headquarters are in Farmers' Bank Building, Pittsburgh.

Pittsburgh & Lake Erie Railroad Co., Pittsburgh, has awarded general contract to Walker & Curley Co., Sharpsburg, Pa., for one-story addition to airbrake shop at McKees Rocks, Pa., to cost about \$50,000 with equipment. A. R. Raymer is chief engineer.

Struthers Wells-Titusville Corporation, Titusville, Pa., has been formed to take over and consolidate Titusville Iron Works Co., and Titusville Forge Co., both of Titusville, and Struthers-Wells Co., Warren, Pa., manufacturers of steam, oil and gasoline engines, oil well equipment, forgings, etc. New organization will carry out general expansion program and is disposing of bond issue of \$1,300,000, part of proceeds to be used for such purpose, consolidation, etc. J. T. Dillon is president.

Indiana

INDIANAPOLIS, Nov. 26.—Plans are being considered by Highland Iron & Steel Co., Terre Haute, Ind., subsidiary of American Chain Co., Bridgeport, Conn., for one-story addition, to cost more than \$35,000 with equipment.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, has plans for two-story and basement service, repair and sales building, 75 x 130 ft., at Indianapolis, to cost about \$100,000 with equipment, to be occupied under lease by Jones-Whitaker Sales Co., 343 North Capitol Avenue, Indianapolis, local representative. Ross Caldwell, 239 Cumberland Street, Indianapolis, is architect.

Board of Trustees, Indiana Village of Epileptics, Newcastle, is said to be con-

sidering construction of power plant at State farm, to cost \$50,000.

G. M. Williams, president Marmon Motor Car Co., 1039 North Meridian Street, Indianapolis, and other officials of that company, are organizing new company to manufacture airplane engines. Local factory will be established for parts production and assembling, to be expanded later for complete aircraft manufacture. New company will not be connected with Marmon company. Howard Marmon will be in charge of engineering for new organization.

Indiana Smelting & Refining Co., 1116 East Sixteenth Street, Indianapolis, is reported planning one-story addition, to cost over \$40,000 with equipment.

Stutz Motor Car Co. of America, Inc., 1002 North Capitol Avenue, Indianapolis, is arranging for increase in capital from 263,000 to 400,000 shares of stock, part of proceeds to be used for expansion, including development of smaller type automobile.

Canada

TORONTO, Nov. 26.—Machine tool sales continue in good volume. Small lists are coming out for new works, and dealers report a steady demand for single tools of a diversified nature for replacement. Car and locomotive builders have bought machine shop equipment, and the automotive industry is also furnishing a good demand. Wood-working tools are in steady call. In general the machine tool market is strong and builders report many unfilled orders on hand.

Canada Pad & Paper Co., Toronto, will start work soon on a manufacturing plant to cost \$150,000. N. A. Armstrong & Co. are architects.

Canadian de Havilland Corporation will erect a factory and hangars at Willowdale, Ont., where it has secured 20-acre site.

L. E. Shaw, Ltd., Chipman, N. S., has started work on a factory to manufacture tile, etc. Machinery will be purchased.

Fairchild Aviation Co., Grand Mere, Que., contemplates erection of an aeroplane manufacturing plant to cost \$500,000. Building will be one and a half stories, 150 x 300 ft.

Frankel Brothers, Ltd., Eastern Avenue, Toronto, has been awarded general contract for erection of a \$70,000 addition to plant of A. R. Williams Machinery Co., Toronto.

Excavation has been started for an office and factory at York Township, Ont., for Riley Engineering & Supply Co., Ltd., 360 Dufferin Street, Toronto. Factory will be one story, 92 x 175 ft., and office building, 32 x 65 ft. H. G. Duerr, 1010 Lumsden Building, Toronto, is architect.

Western Canada

Medicine Hat, Alta., is arranging to increase capacity of its local power plant at a cost of \$100,000.

Hilton Brothers, Ltd., 680 Wall Street, Winnipeg, Man., manufacturer of boiler and pipe covering, has awarded contract to John Gunn & Sons, Ltd., 508 Avenue Building, for a one-story addition, 75 x 90 ft., to cost \$40,000.

Vancouver Pile Driving & Contracting Co., Vancouver, B. C., has general contract for lumber assembly wharf and foundations for \$2,000,000 sawmill and pulp plant at Howe Sound, B. C., for Kraft Co. of British Columbia, Ltd.

Pacific Coast

SAN FRANCISCO, Nov. 22.—Vitalite Piston Mfg. Co., Santa Ana, Cal., has leased two-story factory to be erected on South Main Street for new plant, to cost about \$30,000 with equipment. W. W. Kays, Ramona Building, is architect.

Palo Alto Sheet Metal Works, 521 Ramona Street, Palo Alto, Cal., C. B. Spangler, head, has awarded general contract to Wells P. Goodenough, 310 University Avenue, for one-story unit, to cost about \$20,000 with equipment.

Bach Aircraft Co., Los Angeles, has awarded general contract to Sarver & Sarver, 727 West Seventh Street, for new parts manufacturing and assembling plant, 100 x 200 ft. and 50 x 65 ft., at Metropolitan airport, near North Hollywood, to cost about \$45,000.

Western Sulphur Co., 1 Drumm Street, San Francisco, has awarded general contract to Staton & Dean, 354 Hobart Street, Oakland, Cal., for one-story storage and distributing plant, 40 x 120 ft.

Iron Fireman Mfg. Co., 984 East Seventeenth Street, Portland, manufacturer of mechanical stokers, etc., has arranged for a stock issue of 100,000 shares, part of proceeds to be used for expansion.

Foreign

A COMPANY in Great Britain is planning for a new pulp and paper mill near Rouen, France, with capacity of 3000 tons per month, to cost more than \$2,000,000 with machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Great Britain No. 76095.

Luneburg Power, Light & Waterworks, Ltd. (Luneburger Kraft, Lichtund Wasserverke, G.m.b.H.), Luneburger, Germany, is disposing of bond issue of \$1,100,000 in United States, a portion of fund to be used for extensions.

Humber, Ltd., London, England, has been formed with a capital of £1,250,000 (\$6,250,000) to take over and consolidate company of same name, Commer Cars, Ltd., and Hillman Motor Car Co., Ltd., all with plants for manufacture of popular-priced automobiles. Consolidated company will develop increased output for international business.

Nationalist Government of China, Nanking, has awarded contract to Automatic Electric Co., 100 West Monroe Street, Chicago, for installation of local automatic telephone system to cost \$1,800,000, to be completed in 1929.

Officials of H. M. Byllesby & Co., 231 South La Salle Street, Chicago, operating electric light and power properties, have organized Mexican States Public Service Co., Inc. (Empresa de Servicios Publicos de los Estados Mexicanos, S. A.) to take over and consolidate a number of power plants and systems in Mexico, including generating plant at Hermosillo, Sonora; an electric and ice-manufacturing plant at Guaymas, Sonora, and electric generating station at Culiacan, Sinaloa. Plans are under way for enlargement of two first-noted plants, including installation of additional machinery and construction of transmission lines. John J. O'Brien is president of parent organization.

Thompson Purchasing Co., 8 Rue Edouard VII, Paris, France, purchasing and forwarding agent, has removed offices to 4 Rue Fignon.

THE IRON AGE

New York, December 6, 1928

ESTABLISHED 1855

VOL. 122, No. 23

Simple Control of 52,000 Parts

Cash Register Company
Solves Problem of Regu-
lating Stock and Retain-
ing Its Production
Economies

BY BURNHAM FINNEY*

RAW and finished stocks of the National Cash Register Co., Dayton, Ohio, are controlled so that the amount on hand does not greatly exceed, and yet fully meets, the demands of production. This is done by means of a simple method, although 52,000 parts go into the company's product and many of them are used in such small numbers compared with the output of the equipment in which they are made that frequent and expensive machine set-ups are required. The problem of stock control, therefore, is complicated by the need for an economical volume of output, in keeping with the investment and set-up costs.

About 42,000 parts are produced in the company's plant and the remaining 10,000 are bought. Excluding machinery and other plant equipment, approximately 98 per cent of the raw materials and finished parts purchased by the company is carried in stock regularly. Material is con-

trolled principally through a stock ordering department, which is under the supervision of the factory superintendent responsible for production. Inspectors, on the other hand, report to the engineering department, which is directly responsible to the management. This arrangement eliminates any sympathetic connection between the inspectors and the production department and insures impartial and rigid inspection.

Procedure in Bringing Out New Machine

Before a new part or a new machine goes into production, the future demands committee must decide that it is warranted to meet the needs of a particular line of business. Information regarding the function of the machine is then turned over to the invention department, which makes up models to be examined for mechanical defects and for betterment of efficiency by the register

*Resident editor of THE IRON AGE, at Cincinnati.

Advantages Attributed to Simplified Stock Control System Used by National Cash Register Co.

1. Only material that is actually in demand by operating departments is stored in the stock rooms.

2. All costs entering into the manufacture of parts are tabulated and are available soon after each operation has been completed.

3. Production officials can locate the position of an order within a few minutes.

4. Duplication of records has been avoided, reducing overhead expenses.

5. Inventories of raw and finished stock are determined with comparative ease, in spite of the large volume of material on hand.

6. The system has contributed substantially to lower operating costs and has increased the efficiency of the company's production division.

After the machine passes the register examining committee, prints are sent to the planning committee, the chairman of which is the foreman of the tool designing department. Other members of the committee are the foremen of departments that may have operations on parts making up the machine. This committee decides whether permanent or temporary tools should be made, the kind of tools that are necessary, the type of machine on which parts are to be machined, the time required to make the design of the tools and the due date for the completion of the tools. The committee also prepares a list of the sequence of operations through which the parts are to pass. This information is incorporated in a report called the "planning department list," which is sent to all departments having operations on any part of the machine. A copy also goes to the stock ordering department, which gets from it the following essential data: (1) name of the part, (2) raw material from which the part is made, (3) number of parts obtained from a strip or bar of stock, (4) departments in sequence of machine operations, (5) number of each part per register. Incidentally, the stock ordering department generally knows how many machines are to be built in a given period, how much raw stock will be required, the date for the completion of tools and the date for completion of the machines.

The stock ordering department is responsible for material from the time it is ordered through the purchasing department until it is delivered to the assembly department. In ordering stock the department proceeds on the basis of maintaining a two weeks' surplus to guard against tieups of manufacturing because of temporary interruptions in the receipt of goods. The surplus also enables the operating departments to increase production beyond normal rates for a limited time.

Master Sheet for Raw Stocks

Form No. 1 also shows the price per unit and the average price per unit. The unit price is obtained from the seller's invoice. At the top right hand corner of the form is listed the monthly usage. These figures are put down in pencil and every six months are transferred to the usage column on the main part of the form card.

Form No. 1 is the only record of raw materials, since none is kept in the stock rooms. When a new item is ordered, the stock ordering department sends a note to the stock room where the item is to be stored requesting its entry in the stock room's index and arrangements for its storage in a compartment. The index gives the location and number of all material in the stock room, and raw items received at the plant are quickly dispatched to the stock room and placed in the compartment assigned.

When the figures in the "quantity in stock" column of form No. 1 show that the stock has been reduced to the

Invoice Card No. 1 for Manufactured Parts, Identified as Form No. 13, Is Filed in a Galvanized Iron Pocket on the Stock Bin in the Stockroom. It is the only record of issues and withdrawals. When more stock is to be ordered, it is sent to the stock ordering department and during its absence information is kept temporarily on invoice card No. 2 (form No. 14)

form No. 1. All essential data, such as the part name, number of parts in each stock box, department in which first operation is done, kind of material necessary and number of operations, are listed. On the back of the form is recorded the usage of the part for six-month periods, also the type of machine on which the part is used and the number per machine.

Invoice Card Avoids Complicated Filing

Invoice card No. 1 for manufactured parts, identified as form No. 13, is filed in a galvanized iron pocket on the stock bin in the stockroom. It gives detailed information about the part and is the only record of the issues and withdrawals, thus eliminating duplication of filing and a large amount of detail work. On parts being machined the time allowed for the various operations or the due date for the completion of the part is arrived at by taking into consideration the number and kind of operations on the part and the condition of the departments in which the operations are performed. Two weeks are added to the time allowed for performing operations to take care of any unusual condition in the manufacturing departments. When the stock in the stockroom and on order diminishes to the "low limit," the invoice card is sent to the clerk in the stock ordering department, who places an order and

enters the quantity ordered and due date on the invoice card, and returns it to the stockroom.

When parts are received in stock, the date and quantity are entered on the invoice card by the stockkeeper. When any of the parts are drawn from stock, the amount delivered is entered in the "delivered" column and is deducted from the amount in stock. The "by number" column is for the check number of the stockkeeper making the transaction.

During the absence of the invoice card from the stockroom while an order is being placed by the stock ordering department, all entries of transactions are made on invoice card No. 2 (form No. 14), the memoranda being transferred to the main invoice card as soon as it has been returned. Form No. 14 is not used when the main invoice card is in its bin.

Inventory Taking Simplified

A label for each raw stock bin describes the stock and gives the numbers of other bins in which the same kind of stock is carried (form No. 8). It also shows the date on which the last physical inventory of the stock was taken. The company takes a physical inventory of raw and finished stock at six-month intervals, and the date on the stock bin card is watched by the stockkeeper, who sees that the stock is invoiced within the time limit, taking advantage when possible of the time when the stock is

Manufacturing Departments Schedule Work to Conform to Due Dates Specified on an Order, and Stock Production Order No. 1, Called Form No. 15, Is a Sample of Such an Order. Attached to this form is a tracing and cost sheet giving the location of stock, cost of labor and materials and other items, and serving as a record from which annual inventory of work in process is taken

When the stockkeeper is asked for a report on the amount of any particular material on hand in the stockroom, he fills out form No. 9, and sends it to the stock order clerk. When a department needs material from the stockroom, the foreman fills out and signs a requisition, form No. 10, and forwards it to the stockkeeper, who issues the required material and then forwards the requisition to the order clerk, who deducts the amount from the quantity in stock on record form No. 1. The foreman is required to give the use for which the material is intended. If a department returns goods to the stockroom, the foreman fills out a "stock returned credit ticket" (form No. 11) and sends it with the stock to the stockroom. The ticket is then sent to the order clerk for entry on form No. 1.

All manufacturing departments schedule their work to conform with the due dates specified on the order, and stock production order No. 1, called form No. 15, is a sample of such an order. When invoice card No. 1 (form No. 13) is sent to the stock ordering department to have additional stock ordered, the order clerk gets from it and from the master control record (form No. 12) the necessary information to fill out stock production order No. 1. One copy goes to the making department for requisition purposes, a second to the same department to be filed and a third to the stockkeeper. When the making department is ready to start work on the order, the presentation of the requisition copy to the stockkeeper is his instruction to deliver the quantity of stock called for. He then enters the date and quantity delivered on the requisition and forwards it to the stock order clerk, who enters it under "delivery" on form No. 1 and deducts the amount delivered from the quantity in stock.

Accompanying form No. 15 is a "tracing and cost sheet," on which is kept the record of the location of each box of stock in the factory. Information regarding labor costs is got from a copy of the piece-work or day-work labor ticket, known as form No. 23, which is filled out by the clerk of the department upon the completion of the operation on each order and is sent to the stock ordering department. There the department that has had the stock is credited and the department to which it is delivered is charged with it, entries being made on the cost sheet of form No. 15. The data on the tracing and cost sheet give the location of stock, prevent duplication of payment to workmen, and serve as a record from which the annual inventory of work in process is taken. As a result of this system the cost sheet is kept up-to-date constantly and is never more than 5 hr. behind the actual work. The figures include the cost of labor, of materials and of other items entering into the manufacture of the part. When inventory time arrives, the total value of the work in process may readily be computed from these sheets.

Accompanying each box of stock through the factory is a stock card, form No. 16, really constituting the production order after the first operation, as form No. 15 goes only to the department performing the first operation. The stock card contains the part and order number, name of part, quantity ordered, number per box, truck or box numbers, date ordered and the date the part must be completed. As it progresses with the work through the factory, the quantity of parts processed, the date of finishing the work and the workmen's check number are listed. When a department has completed its operation, the foreman charges the material in the box to the next department having work on that stock. The foreman gets this in-

Standard work or tote boxes are used throughout the plant, and material travels through all operations in the same box. The box number is entered on the time ticket by the department performing the first operation.

When the stock on hand is reduced to the "right-of-way" limit, which is a two or four weeks' supply, depend-

the factory, the tickets indicating to the foreman, tracers and others concerned the importance of the stock.

When the stock in the stockroom is entirely exhausted, a holding ticket is placed in a pocket on the stock bin, which is a notification to the stockkeeper putting away stock that there is a requisition being held for a quantity of the part. Requisitions that cannot be filled because of

stock exhaustion are filed in a central location in the stockroom and are filled immediately when the stock is received.

Whenever it becomes necessary to send stock through the factory ahead of the regular schedule to which it has been assigned, a special "sent-ahead" requisition is used to speed delivery of the material.

Converting Core Ovens to Gas Heating

Ease of Change and Benefits Accruing Stressed in Description of the Revamped Equipment

BY JOHN F. LANGNER*

CORE baking, an essential operation in foundry practice, is still in a state of evolution. This vital process is far from being perfected, but progress toward this end has been accelerated of late years. The essential phase of core baking is the application of heat, and here much of the profits of many foundries is swallowed. The correct fuel properly applied is the answer to this knotty problem. But, while most foundrymen recognize this, they do not seem to know what the correct fuel is nor how to apply it.

Until recently one of the largest boiler foundries in the Middle West used the raw fuel, coke. It was cheap and its use was traditional. But lack of control was a bug-a-bear which cost many rejected charges that had been spoiled by either over or underbaking.

Recently the coke-fired core ovens were converted to use gas as a fuel. The only changes necessary were to block off the ports, at the bottom of the oven, which led from the coke combustion chamber and to place gas burners on the floor of the oven, along each side.

Prior to the conversion the foundry output had so increased that it had been decided to install more ovens. But this was found to be unnecessary, as the use of gas increased the production of the existing units beyond the present needs.

*Industrial gas engineer, Northern Indiana Public Service Co.

Naturally the increased production meant less labor, fuel, time, space and equipment cost. Close temperature control was made possible and through this item rejections and spoiled production were largely eliminated.

Furthermore, atmospheric control was attained by the use of gas—a considerable accomplishment when it is considered that a distinctly oxidizing atmosphere is a requisite in good core baking. By proportioning the gas-air mix-

ture, before it is fired through the burner, a reducing, neutral or oxidizing atmosphere is obtained at will. In this case the latter is desired.

Inside dimensions of the oven are 9 ft. wide, 14½ ft. deep and 8 ft. high. It has two high-pressure Surface Combustion Co. gas inspirators, which feed into two horizontal manifolds, one on each side. The sketch shows the burner assembly in detail. The manifold consists of a 3-in. standard pipe on which 1-in. lava-tip burners, 62 in number, are spaced 2½ in. apart and fired as indicated.

Cores made here are of an oil sand mixture, the ratio being one part of oil to 54 parts of sand by volume, and they vary from 1 to 350 lb., dry weight. A test of 15 heats gave an average of 1.34 cu. ft. gas for each pound of baked cores. At 70c. per M cu. ft. of gas, and 1.34 cu. ft. per pound of cores, the fuel cost was \$1.876 per ton of dried cores. If these ovens were insulated this cost could undoubtedly be reduced.

Short Conveyors in Making Trucks

Handling Heavy Pieces from Machine to Machine on
Rollers or by Monorail—Devices
Used in Assembling

BY FRED L. PRENTISS*

POWER conveyors for progressive assembling of motor truck chasses were recently installed by the White Motor Co., Cleveland. Although the efficiency of the use of conveying equipment for assembling trucks was questioned, the results have proved satisfactory, in that the chasses are assembled more quickly and at reduced cost. Considerable handling of material has been eliminated and the production department is able to do planning better than under the old method of assembling.

The problems faced in laying out the assembly department with power conveyors were more complex in many ways than those involved in building assembly lines for passenger automobiles. On the latter a large volume of cars of one model are turned out. The White company makes 12 distinct truck models on one assembly unit, and in addition there are many departures from the standard designs.

Another important recent change in the methods of this company which has proved of great advantage has to do

with the finished stock. Formerly the company built standard trucks for stock and at times accumulated large stocks. Then much of the truck equipment had to be changed to meet the specifications of the customer. This led the company to discontinue building standard trucks for stock. Instead a stock is built up of standard parts comprising the more important units. A motor is built complete except as to certain parts for which substitution may be made to suit the buyer. Transmissions for the heavier types of cars are built up with various gear ratios, so the purchaser can have without delay the gear ratio he wants. Sleeves are left off the rear axle, permitting these to be assembled with different gear ratios. There are calls from buyers for different types of magnetos and for different motors. With the new method of building up parts that are standardized the buyers' specifications can be quickly complied with by the addition to these standard parts of such parts as are not completely standardized.

As a result of this innovation, the stock is kept in finished machine parts and sub-assemblies or partial sub-assemblies, instead of in finished trucks. This makes the

stock flexible and more liquid and reduces the amount of capital that otherwise would be tied up in finished stock.

Special Racks for Special Parts

An interesting feature of the plant is the material handling system, which has been gradually developed and extended during the past year or two. Trucks with special racks arranged for convenient handling of work are used to transport such parts as crankshafts, camshafts and connecting rods from machine to machine during operations, and from department to department and to the finished stockroom. These are mounted on wheels and are pushed by hand from machine to machine for successive opera-

tions, but for long hauls they are pulled by a tractor or a lift platform truck. The use of racks on which parts do not come into contact with each other eliminates handling in containers, in which parts are in danger of being damaged, and does away with congestion caused by piling parts on the floor. Some parts are handled on skids with lift platform trucks.

Roller conveyors are used for moving some parts between machine operations and rail type tracks are provided for progressive assembling of transmissions, differentials, rear axles and motors. Hand labor in the handling of material, and consequently the fatigue that it causes, have been materially reduced. One result has been a better

Main Motor Assembly Line, at the Right, Is So Constructed That It Can Be Used for Assembling Motors of Various Sizes and Types

Monorail and Roller Conveyors Are Provided for Moving Crank Cases from Machine to Machine for Successive Operations

quality of work produced. As a man doing production work on a machine is a mechanic rather than a common laborer, the company feels that his efficiency on the machine will be increased to the extent that the amount of handling work he does is reduced. Parts stored on conveyors and racks are stored in a more orderly fashion than would be possible with old methods and there is better stock control.

Crankcases and cylinder blocks are moved from machine to machine on roller conveyors. The two rows of cylinder block machines have roller conveyors connected to the tables of the machines, permitting the blocks to be pushed in a straight line from the conveyor on to the table and, after an operation, on to the next section of the roller conveyor.

After the finishing machine operation the crankcases and the cylinder blocks pass over a roller conveyor through a Blakeslee metal washer. From this they move on to a table where an air hose is used in blowing off the chips and water.

Transmission cases are moved through the machining department on roller conveyors. Chain hoists lift the cases from the conveyor to the machine and back to the roller table after each machine operation. On the opposite side of this department gears are cut and other parts that go into the transmission assembly are machined. The various parts come together on the transmission assembly line—a steel track at working distance above the floor. The transmission case, set on a carrier mounted on wheels, is pushed along the track for progressive assembling. A hoist picks

In the Frame Assembly Department There Are Three Parallel Assembly Lines

Chasses Are Assembled on Power Conveyor Lines So Arranged That They Can Be Used for Assembling 12 Different Models of Trucks

up the assembled transmission case at the end of the line and sets it on a test stand.

Crankshaft forgings are brought into the plant on skids handled by trucks and after the first operation on the rough stock the shafts are placed on A-frame trucks holding 10 crankshafts. Camshafts are handled in the same general type of truck. These are loaded on pins on the four sides of the truck, each truck having a capacity for about 60 of the smaller sizes of shafts. The crankshafts and camshafts are pushed on these trucks from machine to machine for successive operations; when finished, the trucks are towed to the assembly line. Flywheels are handled on skids. Pistons are transported on A-frame trucks having shelves on each side. Similar trucks are used for handling connecting rods, each having a capacity for holding 120 rods.

The differential for the lighter type of axles is assembled on a carrier running on an assembly track, the operations being performed at various points along the line. First the case is put on a carrier and when the end of the line is reached it has been built up into a complete rear axle assembly. Permanent fixtures assist in the operations. Some of the parts are banked on adjoining tracks, which are connected to the assembly line by a turntable. When the completed axle is lifted from the line the carrier is pushed off on to a buggy which carries it back to the start of the line.

Assembling Engines on a Conveyor

The motor assembly conveyor line is a track built of two flat rails approximately 200 ft. long. This track is sufficiently wide to handle assemblies of all sizes of motors made in the plant. Three roller equipped carriers are bolted to the ends of the crankcase, which is pushed along the track on the rollers. The assembly line is located in the basement adjacent to natural light and ventilation. All finished stock is kept in a stockroom at the side of the line. Several roller conveyors at right angles to the motor assembly line are provided for feeding finished parts from the stockroom to points where they are wanted along the line. Chain hoists operating on overhead monorails at right angles to the assembly line bring the larger units, such as cylinder blocks, crankshafts, transmissions and flywheels, to the line at points where they are to be assembled. Bins are located along the assembly line for carrying small stock, these being supplied from other bins in the stockroom.

Stops are provided in the assembly track to hold the

motor at fixed points when parts are being added. The track has short hinged sections at various points, which may be raised to permit a man to work at the front end of the motor assembly. For convenience in assembling there are also roll-over sections in the track, for turning over the unit, which starts on the line with the crankcase in an upside down position. Several half revolutions of the unit are made during the assembly of the cylinder block, connecting rod, pistons and cylinder head. Sub-assembly work is done on benches at the side of the line. Nuts for attaching the cylinder head are driven in by a machine located at the side of the line. Two shorter assembly lines, very similar to the main line, are provided for some of the models.

On completion of the assembly the motor is picked up by hand hoists and put on a running-in stand. There is a network of overhead monorails for handling the motors from this point, as well as for conveying other parts. The finished motors are carried on a four-wheel truck to the dynamometer testing machines and from there to a spray painting booth. After painting and drying they are placed on trucks, five to a truck, and hauled to the chassis assembly floor.

Frames Put Together in Three Lines

Three parallel lines of the rail type are provided for the progressive assembly of frames. Two of these are for the lighter frames, which are received assembled with the exception of the brackets, and the third for the heavier units. The frames, as they move along the lines, rest on bar supports extending beyond the rails on each side, and mounted on a carrier which runs along the rails on two wheels. Layout jigs for centering the holes are suspended from overhead hoists that move on a monorail above the assembly lines. Electric hoists mounted on hand propelled trolleys are used for turning the frames over. Suspended from the hoist is an I-beam, at each end of which is a wheel-operated chain that is swung around the frame for turning it over. The side members of the heavy frames are placed on the line, cut to length and bent. The frames are hot riveted,

Section of Final Assembly Line Where the Chassis Is Spray Painted, After Which It Moves into a Drying Oven

rivets being heated electrically. An electric hoist, on a monorail extending over the lower end of the frame assembly lines, picks up the completed frames and carries them to the adjoining erection or assembly shop.

Three parallel chassis assembly lines permit progressive operations. The frame is first placed on two horses mounted on casters. Then the front axle is placed beneath the frame on a dolly and the front springs are fastened to the frame. Then the rear axle is run under the frame on a second dolly and the rear springs are fastened to the frame. The frame at this stage is resting on the two dollies, each mounted on two wheels at each end. The dollies serve as a carriage while the chassis is being moved along the line.

The frame is pushed forward until the first dolly is engaged by the power conveyor of the chain type, which is just above the floor level. As it moves along the line the dolly wheels run on plate rail tracks laid on the floor. Then the motor is let down into the frame by an overhead chain hoist, and the other parts are fed into the chassis from either side as the latter moves along the line.

At the end of this assembly line all parts have been put on the chassis except those which would be injured by heat. Reaching the end of the line the chassis is transferred by means of a monorail hoist to the second conveyor line, on which it moves in the opposite direction, to be cleaned and painted. The conveyor carries the chassis through a washing booth, where it is washed with steam and the dirt is blown off with air. Then it is spray painted in the second booth, in which there is down-draft suction through openings in the floor, to draw away the fumes. It moves from the painting booth into a steam heated oven where the paint is dried. Leaving the oven, a hoist sets it on the third conveyor line and, while it moves along this under power, the wheels, tires and cushions are put on, finishing the chassis assembly.

The assembly conveyor is 350 ft. long and moves at a speed of 3 ft. a minute. The larger units to be used in a day's operation of the chassis assembly line are usually put on the assembly floor at night or early in the morning. Small stock is kept in bins and racks along the line, and one day's supply of the larger parts, such as wheels and axles, is on hand at the proper points on the floor when the assembly starts in the morning. The times of all operations in chassis assembling have been determined by time studies, and the men working on the line are paid under a group

piece rate and bonus system fixed for the crew as a whole.

A method of laying out machinery that is followed in the planning department has proved highly satisfactory. All equipment in each line of buildings is shown in a factory layout made on 9 x 20-ft. layout boards on a scale of 1/4 in. to the foot. When any change in the arrangement is desired, because of the addition of new models or the installation of new equipment for old models, a layout is made on the board. Small pieces of cardboard are used, in different colors, pinned to the board to indicate each machine and its type; lines show the location of conveyors and trolleys and strings show the proposed routing. The proposed routing as prepared by the planning department is closely studied by the production department heads, and perhaps a number of changes may be made before a layout is decided upon. When the arrangement is definitely agreed upon, the pieces of cardboard showing the location of the machines are replaced with similar pieces which are all blue, and the board is kept as a permanent map of the department layout.

Stresses Induced by Arc Welds

IN an effort to investigate the stresses induced in a metal plate by the electric welding process, the committee on welded rail joints of the American Electric Railway Association took a 1/2 in. plate, 8 in. wide and 24 in. long, and deposited a small welded bead on one 24 in. edge. L. H. Crook of the department of mechanics, Catholic University of America, Washington, studied the stresses by a comprehensive set of strain gage readings.

Large "negative" or compressive stresses are induced in the plate adjacent to the weld. Some of these are beyond the elastic limit of the metal, so numerical values cannot be given them. These deformations persist even after the welded bead is carefully milled off. Along a line two inches below the head an elastic stress of 30,000 lb. per sq. in. is reduced 50 per cent by cutting away one inch of the plate. The stresses in all parts of the plate seem to be reduced by approximately one half of their original value when the first inch below the bead is cut away. Maximum tension stresses of about 15,000 lb. per sq. in. are induced in the edge farthest away from the weld; the neutral axis is about one-third the distance from the bottom edge.

Carnegie Safety Trophy a Miniature Converter

THE safety trophy for which the various plants of the Carnegie Steel Co. will compete in 1929 is an actual Bessemer converter in miniature, perfect in detail, and fashioned after a unit at one of the principal plants of the company.

The converter, supports and accessories are of sterling silver and rest on a bronze plinth, oblong in form, 25 in. by 34 in., which bears silver shields designed to carry the names of the monthly winners. At the front and rear of the converter are bronze statuettes of two of the master steel workers, one of whom is employed at the Homestead plant and the other at the New Castle, Pa., works. Beneath the figure on the front of the composition appears the name of the company, cast in bronze, and a larger shield or plate which will carry the name of the winner in perpetuum at the end of the year.

Mechanizing Minnesota Iron Mines

Changes of Late Years in Both Underground and Open-Pit Mines—Electric Power Shovels

MECHANICAL ENGINEERING in the iron ore industry was covered in a comprehensive paper by A. Tancig, mechanical superintendent Shenango Furnace Co., Chisholm, Minn., presented before the recent St. Paul-Minneapolis meeting of the American Society of Mechanical Engineers. The following has been taken from the contribution:

High production at low cost is the aim of both the open-pit mines and the underground mines. It should apply more particularly to the latter, because production in underground mines is naturally limited. To obtain low costs we are mechanizing more and more our underground operations—using hand-held air-operated jack-hammer drills for hard ground, and hand-held air-operated auger drills for softer ground. Hand shoveling or mucking the ore into cars is a thing of the past in most mines. Loading into the cars and chutes is now being done by slushers, or scraper loaders, a machine consisting of an electric-motor-driven two-drum hoist, with one pulling rope for hauling the loaded scraper and a tail rope for returning the scraper to the face.

An indication of the usefulness and growing demand for these scraper loaders is that the earliest type, six years ago, had a 2¼-hp. motor, whereas today we have them as large as 20 to 50 hp., with either clutch or remote control. The net result is less arduous labor, greater production per miner, and a reduction in the cost per ton of ore produced.

Cars in use underground range from the 1-ton-capacity sub-level type to the 5-ton main-level type, all with ball or roller bearings. The main-level cars have half to three-quarter size automatic couplers to facilitate handling in trains, and are run at high rates of speed over heavy steel rails. The cars used underground are all-steel, sturdily built, usually for 24-, 30- or 36-in.-gage track, with 14- to 16-in. diameter wheels. Chilled-iron wheels are considered preferable to manganese, as being less abrasive on the rails, frogs and switches. As yet, steel ties have been used little in the underground mines, although the only objection is the initial cost.

Steam-engine, handbrake-operated hoists are being replaced with electric-motor-driven hoists, either directly connected or having a single-gear reduction with herringbone gears and oil-operated post brakes. The latest hoists are equipped for safety with overspeed and overwind devices. Such electric hoists range from 100 to 1300 hp. (motor rating) and are for depths of from 200 to 2000 ft.

Pumping Equipment of Today

Underground drainage has been shifted from the old reliable, though sometimes bulky, steam pumps, requiring large pump stations underground and long steam lines, to motor-driven centrifugal pumps or motor-driven multi-plunger pumps. A recent addition to our pumping equipment and one that gives great promise of further economies is the deep-well turbine-type pump.

The last few years have seen continued abandonment of the isolated power plants which every mine had and the installation of electrically driven equipment. The result is a more flexible and efficient operation, fewer men employed and a lower production cost.

When the underground mines operate during the winter, they accumulate stock piles of ore that are loaded during the shipping season into 50- or 75-ton steel ore cars by

steam shovels. Where the shovels are electrically operated and have caterpillar traction, only two men are required to operate each one, where formerly eight men were necessary.

Open-pit mines have relegated the smaller underground producers to the point where their high cost and low production are at best a worry and sometimes a liability. Mines of the open-pit type had their real start in the early 'nineties. The equipment included the ordinary contractor's scrapers, carts and shovels, all of a type which can be seen today in any small grading or foundation job. But the growth of the industry created a demand for bigger and more efficient equipment, until today the machinery is the latest, most efficient and largest in existence for mining purposes.

Electric Power Shovel Introduced

Up to six years ago all shovels were of the steam type, ranging from the 1½-cu. yd. dipper capacity, 50-ton type, to the 8-cu. yd. dipper capacity, 350-ton type. The average production shovel, however, was the standard railroad type having a 4-cu. yd. dipper, self-propelling on rail sections, 135-lb. steam pressure, approximately 85,000 lb. bail pull. These shovels have lately been fitted with caterpillar traction to facilitate moving about and to reduce the labor servicing each machine.

About seven years ago electric power shovels were introduced on the iron ranges. While their general adoption was slow, it was not because of any lack of appreciation of their advantages, these being only too obvious. But rather it was because of a policy of watchful waiting until most of the objectionable features could be corrected by their manufacturers. This policy of cooperation between the few users and the manufacturers was a wise one, because today we have not a large variety of makes of electric power shovels, but rather the shovels of only two manufacturers are in general use.

OPERATING COMPARISON, APPROXIMATE, FOR EACH SHIFT

		Steam		Electric
Operator	1	\$10.35	1	\$10.35
Cranesman	1	7.55	0	
Fireman	1	5.70	0	
Oiler-helper	0		1	5.70
Pit men	5	21.70	0	
Night watchman	1	5.70	0	
Power for 1500-cu. yd. per shift		32.25		12.00
Interest on investment....		7.00		11.60
Maintenance, season repairs and Sunday watchman...		9.00		3.00
		\$99.25		\$42.65

The figures are given merely to show the trend and the result of modern planning. These later-type shovels have cut herringbone gears, inclosed ring-oiled bearings, pressure lubrication, bronze-lined bearings, castings of steel, alloy-steel shafts. Motors and motor-generator sets have ball or roller bearings and the shovels are as nearly automatic and fool-proof as it seems humanly possible to make them.

Ore-Hauling Cars

Two classes of cars are used in the pits. One is the standard 50-ton and 70-ton all-steel ore cars belonging to the railroads and hauled in trains to the ore docks after being loaded in the pits. The other class is the mine-owned

all-steel dump cars ranging from 16 to 30-cu. yd. capacity, equipped with air brakes and with large air cylinders on each side of the center frame for dumping the loads.

In connection with certain pits having ores which require beneficiation, there are ore-washing plants for removing the free silica from the ore through agitation in water. The washing plants, developed over a period of years, range in capacity from 125 tons to several thousand tons an hour.

A later beneficiation plant is the crushing and screening plant for screening out the large lumps of ore and crushing them to shipping sizes. Whole trainloads of ore from the pits are dumped into the bins at one time, and the

material is screened, crushed and reloaded into ore cars within the space of a few minutes.

An interesting sidelight on the increasing use of machinery in production of iron ore is in the fact that there has been no increase in the accident hazard. This result is being achieved because the safety of the employee is always the first consideration when laying out or purchasing new equipment. The employee's safety has become so important that each mining company has a separate department whose sole duty is to cooperate with employees, foremen and superintendents in promoting the greater safety of everyone on the payroll.

Index Which Prophesies Trade Movements

Methods Used to Construct the Valve and Fittings Index Used by Walworth Company to Control Manufacturing Activities

AT the recent Chicago meeting of the American Management Association, Joseph H. Barber, assistant to president, Walworth Co., discussed the scientific methods underlying the "valve and fitting index." His company had been attempting unsuccessfully to correlate production records with known conditions in various markets, and in 1921 concluded that the fluctuations in its business could be best explained in the light of normal activities in general trade.

Next it was agreed that the general trade conditions were most promptly reflected in the flow of orders from jobbers. Evidence that this holds true was found in a study of merchant pig iron, for which statistics are available for many years showing orders, shipments, production and prices. The Walworth company's problem then was to find some index, related to orders or to demand (in the several basic industries which consume valves and fittings) which could guide it in budgeting for production. Of course, it was recognized that if some such index could be devised which would closely parallel the condition of the Walworth company's order books, even that would be of little use in forecasting business conditions, unless an adequate theory on the business cycle could be invented.

In attempting to build up an index curve, the many items of valve and fittings manufacture were segregated into several classifications of related products, and the production curves of each group studied individually. It was found immediately that these curves showed violent fluctuations, even though Carl Snyder's "volume of trade index" (carefully adjusted to eliminate seasonal and secular variations) varied no more than 10 per cent up and down. But when plotted data on the various industries which bought a certain group of fittings (called for convenience Group A) was compared, it was found that the swings were from 4 to 12 times as violent as Snyder's volume of trade index for all American industries.

In order to compare this mass of more closely related data, the curve for each industry was recomputed in terms of its own "cycle unit" by methods used by the Harvard Committee of Economic Research. When these adjusted curves for the consuming industries were plotted on a single sheet, and an average struck, it was found to show a surprisingly close relationship to the curve showing orders for Group A of Walworth goods. An even better agreement between the curves (see chart) was forced by giving the various industries appropriate weights, as suggested by knowledge of sales conditions, or by the evident divergence of individual data in those parts of

the curve where the unweighted average departed considerably from the curve representing actual sales of Group A products.

This study proved that orders in Group A fluctuated widely because, on the average, the industries which give orders for such products fluctuated in the same way. Therefore, to budget production of these products intelligently, it would only be necessary to collect opinions and forecasts for each of these consuming industries, reduce them to numerical statement, give each one its proper

Close Agreement Between Orders for Product (Full Line) and Complete Trade Condition in Consuming Industries (Dotted Line)

weight, and plot the result. If the curve turned up, prepare for increased orders; and vice versa.

When this plan of study was worked out for the various classes of valves and fittings, several pronounced similarities in the various groups were discovered. Furthermore, some of the consuming industries were much more "sensitive" than others, that is, seemed to have most effect in the marked divergence from those indexes related to more general business conditions. It was therefore to select the most important or indicative from the 60 series of data available and compute the final index as a weighted average of 16 separate indicators of national demand. Five of them are the "sensitive" ones, and the rest are responsible for the relatively stable absorption in such lines as buildings and equipment. Experience has shown the valve and fittings index, as so computed, to have the following distinctive features:

1. It is a broad sample of conditions, not a single company's experience.
2. It measures the volume of jobber orders; therefore measures jobber's psychology.

3. It indexes trend of demand—the orders to be derived from basic industries.

4. It measures quantity of going business, rather than prices or profits.

5. It turns corners ahead of other barometers, because it reflects immediately conditions among the jobbers.

6. It has definite swings, because of the "sensitive" factors included in its composition.

Should Furnaces Run on Sunday?

Question of Shutting Down Blast Furnaces Once a Week
a Live Topic 79 Years Ago

WHETHER men employed in steel and iron plants should work on Sundays had the attention of those engaged in the business as long ago as the middle of the last century. Going through some correspondence of his grandfather, Frank Brooks, vice-president First National Bank, Pittsburgh, discovered letters bearing dates of July 18 and July 19, 1849, that dwell upon the feasibility of shutting down blast furnaces on the Sabbath Day. A transcript of a reply made by J. Kennedy Duncan, who operated a blast furnace at Springhill Furnace, Pa., to the Rev. Isaac M. Cook, a clergyman of Beaver, Pa., together with the observations of his brother Samuel Duncan, are interesting as showing the views of blast furnace men of those times on the matter of interrupted operation of the furnaces.

Springhill Furnace, Pa., July 18, 1849.

Dear Sir:

Yours of 10th inst. on the subject of closing blast furnaces on the Sabbath Day is before me. To your first inquiry, "Have you ever attempted the experiment of running your furnace without being in blast on the Lord's day?" I answer, I have. The result has been not always the same. Some six years since, in making the experiment, it failed on one or two occasions. Since, up till the summer of '47, attempts were made with unsatisfactory results. In the summer and fall of '47 I had two furnaces in operation; the experiment was again made at both and succeeded well.

To your second inquiry, "If you have made the experiment and failed can you acquaint us with the nature of the difficulties that have thus far frustrated your endeavor to hallow the Sabbath; are they accidental, such as might be remedied by improved machinery, or by removing the necessity of running on the Sabbath because of competition, or are they permanent, growing out of the nature of the business?"

I reply that the failure in the first experiment was owing to the nature and quality of the ores then used, together with a decided dissatisfaction of the workmen who, strange as it may appear, though no diminution was made in their wages, were decidedly opposed to closing the furnace on the Sabbath. Any lack of yield, or if the yield was there and the iron not so good, was always attributed to stopping one day in the week. This to me was a serious difficulty from the fact that it always excited my suspicions that they did not do their duty, although I had no positive evidence of it other than this—that, instead of being stopped 24 hours, it was usually 30 and some times more. I would say then, from the experience I have had, that the blowing of furnaces does not grow out of the nature of the business unless it be owing to certain qualities of ore that are of a hard and obstinate nature, more or less impregnated with sulphur. This difficulty I suppose would be remedied by using hot blast—I have always used cold blast.

To your third inquiry, "If you have succeeded in the experiment is your iron of as good quality as before; by resting do you lose more than one day's blasting? Is your machinery different from that in com-

mon use? Do you make more or less high metal than before? What effect has the change had on the conduct and character of the hands", I state the quality of iron is the same—high and gray iron about in the same proportion as when blasting all the time. As a general thing there was no loss of stock that I could perceive. The machinery for blasting as also the construction of the furnace are as those in common use.

I could not discern any material change in the conduct and character of the workmen other than this, that instead of seeing them at their accustomed posts on the Sabbath they would as a general thing, (at least seemed to be) in their "right mind," for they were clothed and found their places in the sanctuary of God. Allow me the privilege here of saying that in seeing these toiling men coming into the church door and orderly taking their seats, listening with attention to the Words of Life as they fell from the lips of him who was ministering in the Saviour's name, was truly a source of real enjoyment.

It is further my duty to state that, although the furnaces before alluded to operated successfully for a time by resting on the Sabbath day, yet subsequently to my great mortification I have been under the necessity of blowing, during what time the furnaces have been operating, on the Sabbath day. This was owing as I supposed just to a very decided defect in the boshes, which occasioned the putting in of no less than six new hearths in the space of one year, whereas one ought to have been sufficient; second, to the working of poor ore that was of a hard, inflexible character, requiring more coal than ordinarily for smelting.

I also inclose you a communication from my brother Samuel on the same subject.

Very respectfully,

J. KENNEDY DUNCAN.

Rev. Isaac M. Cook, Beaver, Pa.

Fairchance Iron Works, July 19, 1849.

Dear Kennedy:

Agreeably to your request I now give you my experience in blowing furnaces, or rather in not blowing, on Sundays. I think much depends on the stack—that it is tight so as to exclude the air, and a great deal more on the quality of the ore. I mean ore that is easily smelted. In operating with Wharton Furnace in 'forty seven, we adopted the plan of stopping every Saturday night at 12 o'clock and opened 12 o'clock Monday morning; the furnace did well. We made from 16 to 19 tons of metal per week, that is in the six days; which was generally considered a good week's work when Sundays were included. The stack, however, is good, and the principal part of our ore the very best.

We found no difficulty either in stopping or opening up the furnace, as regards the working of it. We would have running cinder in an hour after the blast would go on Monday morning, and by daylight to all appearances the furnace would be hot and working

(Concluded on page 1451)

New Fabricating Plant in Philadelphia

American Steel Engineering Co. Has Space for Considerable Expansion—Easy Handling of Materials

SEVERAL features of the new plant of the American Steel Engineering Co., 3520 Queen Lane, Philadelphia, impress themselves upon the visitor. The plant has been laid out with forethought as to expansion, and in such way as to facilitate handling steel in and out. It is served by a spur track, from the Reading Railroad, which enters the main building at about mid-length and goes clear across.

On the railroad side of the building, traversed, of course, by the same spur, is the steel yard, under cover but not sided in. This shed is of the same span, roof height and skeleton construction as the main building and immediately adjoins it. Expansion will take the form of continuing this shed building to a length approximating that of its mate

and closing the ends and sides, making a second broad bay, parallel to the first, for fabricating work.

Across the street end of the present building is a two-story office and storage building, of brick facing on concrete and measuring 32 x 64 ft. The fabricating bay, in one room, is 64 x 220 ft., directly in rear of the office. Its roof trusses leave 20 ft. clear above the concrete floor. The walls are concrete to about 6½ ft., then ribbed glass to the eaves along the two long sides.

Fabricating work is done mostly upon the basis of engineering in the plant. This covers all details both for structural steel and for reinforcing steel, both of which are prosecuted over a considerable territory centering in Phila-

Interior of the Fabricating Shop Looking North. At A is the platform for tool room or machine shop, with compressor room under it; B B are the punches and shears; C is the roller straightener for plates; D D D are bar benders

At top of page is the plant, viewed from the Reading Railroad crossing. The steel receiving shed appears prominently in center, with storehouse this side of it. At its left is the forge shop

delphia. Bridge work is not attempted, except on simple designs similar in detail to structural forms for buildings.

Materials handling is by means of traveling hoists running on I-beams supported directly under the roof trusses. One 5-ton hoist is electrically driven and carries a cab. The others are differential chain hoists operated from the floor. It is planned to put in a light overhead traveling crane in the main bay, as the present runs do not give the flexibility expected.

Two Pels combination punches, shears and plate slitters are the heaviest pieces of fabricating equipment. The larger one can take a 15-in. I-beam and can punch a 1-in. hole through $\frac{3}{8}$ in. of steel. Some changes are being made so that it can handle 24-in. beams. The other one is used mainly in cutting bars. Three Kardong benders (Minneapolis) are used for reinforcing bars. Two of them are motor-driven. There is a set of bending rolls for plates. For bending structural shapes, when required, reliance is placed on a small forge shop, in a separate brick and concrete building.

There is the usual machine-tool equipment of a fabricating shop—drills, shaper, power hacksaw, etc. A small machine shop is being installed, on a balcony above the air compressor room, which will be in the nature of a tool room, but will be available for a variety of work. This is under command of the projected traveling crane.

Much welding is being done, so far as building regula-

tions and codes permit. That done in the shop is electric, with General Electric units. Field welding is by gas. In a few cases, where it has been necessary to remove a clip or other piece which had been welded on, the clip broke outside the weld and the beading had to be chipped off.

One useful "kink" observed in connection with the bar cutter was in the method for gaging lengths. The bar being cut lies in a trough consisting of a long channel, web downward. At 3-in. intervals holes have been punched through both flanges. These accommodate a gage block. For variations from exact 3-in. lengths, 1-in. or 2-in. spacers are used. Foot marks are stenciled on the channel at the appropriate holes.

Natural light is very good, all over the shop. Night work, which is not infrequent at present, is facilitated by the electric lighting system, lights being suspended in sufficient numbers just above the bottom line of the girders. Heating of the office is by hot water, with gas fuel, under thermostatic control.

In addition to its work of fabricating (and often erecting) steel, the company maintains a welding equipment department. It acts as distributor of General Electric welding units, having territory extending from southern New Jersey over all of Pennsylvania, Maryland, Delaware and most of West Virginia. To handle this business in the western part of Pennsylvania, a branch office has been established in Pittsburgh.

How Procedure Control Welding Originated

Rapid Construction of Overland Pipe Lines Magnified All Managerial Problems Found in Production Welding

BY G. O. CARTER*

WELDING metal by the use of the oxy-acetylene flame (or "oxwelding") had its first beginning in the United States in the early years of the twentieth century, following experimental work done in Europe. The development in 1906 and 1907 of a commercial source of oxygen gas gave the process its first real impetus and oxwelding began to be used to an appreciable extent in American metal working industries.

At first the process was most often used for emergency repair and proved a great boon in many instances. Tremendous amounts of money were saved through reconditioning equipment that otherwise would have been scrapped and in preventing losses through production delays.

Even in these early days, however, it became evident that there was an important application for oxy-acetylene welding in routine production. Of the early ones was the manufacture of steel barrels, and a little later the welding of pipe for various services began to assume some importance.

Early Work on Pipe Joints

As far back as 1911 some work on overland lines of steel pipe was done, and there is a line transporting manufactured gas now in operation which was laid by welding during that year. At the Panama-Pacific Exposition in 1914 practically all of the pipe for all services from water to high-pressure steam was oxy-acetylene welded, this installation involving many miles of pipe in many different sizes.

In the summer and fall of 1922 an important forward step in the construction of pipe lines was taken. A 140-mile, 8-in. oil line was laid by the Prairie Pipe Line Co.,

under the supervision of N. E. Wagner. The work was eminently successful and was described by Mr. Wagner before the International Acetylene Association. Mr. Wagner's work won for him that association's highest award, the Morehead Gold Medal for 1922.

It thus became quite evident that the laying of overland lines with oxwelded joints offered an important application of the oxy-acetylene welding process. However, there were a number of considerations, involving management and operation, that seemed likely to affect the acceptance of welding as a routine construction method for pipe joints.

Difficulties Encountered in Scattered Crews

Early opponents of the welding idea stressed the fact that the quality of the welded joint was dependent on the skill and integrity of the welder. Others pointed out that it required supervision of men more than ordinarily skilled in welding practices to insure uniformly high-grade results. Laying a pipe line in the oil or natural gas country, where the welders operate many miles from their base of supplies and under varying conditions of weather, offered a difficult problem in personnel, training and management. Transporting oxygen and acetylene to the welders also involved some difficulties and the matter of an adequate method for field testing the finished joints before the line was put into operation was another item that required study.

It was evident from the beginning, to members of our organization, that if pipe welding was to be generally accepted these various matters would have to be studied and the best practice developed for each of the fundamental ele-

BOOK REVIEWS

Employee Questions Statistically Treated

Employee Representation. By Ernest Richmond Burton. Pages 283. 5% x 8 in. Published by the Williams & Wilkins Co., Baltimore. Price, \$3.

In an excellent preface to Mr. Burton's book, Henry C. Metcalf calls attention to the three significant contributions that employment representation is making to American industry: converting industry from a purely productive process into an educational experience, facilitating the realization of more truly scientific management, and injecting new meaning and value into democracy.

What this volume covers is an investigation of the history of employee representation in this country, the motives prompting employers to install representation plans, and the obstacles and difficulties that have beset the movement; and finally, an interpretation of employee representation and the desirable direction of its further development. Indications thus are that the author had made up his mind before making the investigation.

The author's definition of the term "employee representation" is: "broadly . . . to include any established arrangement whereby the working force of a business concern is represented by persons recognized by both the management and the employees as spokesmen for the latter in conferences on matters of mutual interest."

Neither the various socialistic and academic experiments in Europe, nor Mill's approval of workers' election of managers, is causally related to the present development. The oldest case in operation in this country is the Filene cooperative association, started in 1898 as an insurance committee. Other companies strove in this direction, but not until 1915, or say when Rockefeller became an earnest advocate of the system, was there any very great progress in this direction. To speak of the various attempts, successful and unsuccessful, in this country and abroad, would take up too much space; so we come to the essential features of the American development of the movement in question.

Special chapters are devoted to the sources and nature of modern industrial conflicts, the managerial objectives of employee representation, the methods of organization and extension of the plan, managerial responsibility for operation, the methods of assuring adequate representation of the employees, joint conference bodies, organization for integration, some of the problems of operation and their solution, and terms and conditions of employment.

There is a good appendix of selected bibliography. As a whole, the book leaves the impression of being a mass of statistics rather academically treated.

quoting the rules themselves and following with a discussion of the law, supported by a citation for each statement. The table of cases includes more than 1600 decisions and the table of contents, 413 headings. The topical arrangement follows closely that of the Patent Office rules of practice with which attorneys and inventors are familiar. The typography is pleasing and the language simple and easily understood and the general arrangement effective for ready use. The index appears to be complete.

The author presupposes a knowledge on the part of the reader of the fundamentals of patent law. The book is addressed to the busy patent attorney and to the engineer who, having had a liberal amount of experience with patents, is desirous of having at hand a volume which will give to him the answer to the hundreds of questions which must come up in his mind. It is a work which will be found of great value to the intense student in the patent field.

The basis of the volume is the collection of notes of Loyd H. Sutton, a successful practitioner in the patent field, a former examiner in the Patent Office, and lecturer at George Washington University on the subject of patent law. Mr. McCrady has bestowed four months of intensive work on these notes, putting them in shape for publication. He has revised them, added to them, rearranged them, and checked them over.

Cartels in Germany and Elsewhere

Kartelle und Staat, unter Beruecksichtigung der Gesetzgebung des Inund Auslandes. By Dr. O. Lehnich. Pages, 314, 6 x 9 1/4 in. Published by Reimar Hobbing, Berlin. Price, 16 m.

Of course, "cartel" has a very elastic definition. Before the Great War when it was attempted in Germany to frame a law covering rings, cartels, gentlemen's agreements, syndicates, *et id genus omne*, there were in the empire at least four hundred such, of about twenty different varieties—vertical, horizontal and otherwise—and it remained for the late Hugo Stinnes to increase the number and variety.

As the functions of each cartel must be considered in relation to one or more of all of four principal factors—selling conditions, price-fixing, amount of production, and method and amount of sales activities—it will be seen that writing a work on this subject is somewhat like preparing a detailed description of the universe, with particular reference to the seven or eight bodies most familiar to us terrestrials.

Demand and supply of course play a great rôle, and cause the rise and fall of one or the other of the various kinds of combinations intended to produce proper equilibrium. For, as the author remarks, when demand is greater than supply, the State must protect the consumer from the producer; the converse, when supply is too great. There are also to be considered such items as movement of population, climatic conditions, natural resources, political divisions, water supply, etc. To all of this we add the general trend of public opinion, and the differences in development and surge of the various branches of industry.

The author starts with the statement that cartels are "agreements between independent producers in the same line, for the purpose of regulating the market and limiting production." He is not of the opinion that their purpose is monopolizing the market, but that they are simply to regulate and reduce competition. The fact that they can first fulfill their purpose when the circle of firms is closed, and that especially for this reason cartels that regulate produc-

Covers Patent Matters for the Engineer

Patent Office Practice. By Archie R. McCrady. Pages 387, 6 1/2 x 9 1/4 in., illustrated. Published by H. D. Williams Co., Ouray Building, Washington. Price, \$10.

Each year America produces more inventions than the previous year; each year the work of the United States Patent Office increases in volume and technicalities; and each year patents for invention become more and more a factor in the country's industrial development. It is by no means an easy task for the inventor to keep abreast of the technical procedure involved in the procuring of his patent.

To meet this situation quite a number of books have been written by patent lawyers covering various phases of technical patent law and Patent Office practice. It has, however, been left to A. R. McCrady to bring together in one volume a concise consideration of the rules of practice,

tion especially desire monopoly does not, in his opinion, alter their object.

The third section of the book considers what is of comparatively little importance to Americans—the purely German cartel laws.

The fifth section concerns cartels in countries without any special laws governing such matters: Peru, New Zealand, Australia, Argentina, etc. The sixth groups according to, on the one hand, whether they provide for legal measures against combines, or, on the other hand, provide full legal protection for them.

England is the only country in which free competition is defended by law. There is no especial legislation about cartel contracts; all is governed by the "common law." France is a good example of making the law agree with the business conditions that it is intended to control; both bearing and bulling of prices being forbidden. In Switzerland the French laws of the late thirties were introduced in some cantons, private agreements preventing unlimited competition. In Belgium, fine and imprisonment threaten those who by illegal or improper methods either raise or lower prices artificially and in great degree. Italian anti-cartel laws are much like the Belgian. In Spain there is no great tendency toward combinations, but there are laws against those tending to limit competition and raise prices unduly. Holland does not concern itself, as a State, with cartel matters. Denmark has a recent law against combinations tending to limit competition. In Hungary, although cartel matters were debated for a great while, there is as yet no law governing them. In Japan there is a law against "uncommon regulation of prices in order to attain excessive profit."

The excellent alphabetical index, and the list of works collated (nearly three hundred in all) show the thoroughness with which this volume has been prepared.

ROBERT GRIMSHAW.

Cyclopaedic Account of Automobile Steels

Autostaehle des Welthandels. By Dr. A. Mueller-Hauff and Dr. K. Stein. Pages, 189, 5¼ x 8½ in.; illustrations, 39, and plates, 10. Published by Verlag Stahleisen, Dueseldorf. Price, m. 9.

The fact that 90 per cent of the materials employed in the automobile industry consist of iron and steel, and that without the comparatively recent improvements in the latter material the wonderful progress in that industry would have been impossible, shows us that "auto-steels" deserve a thorough technical and practical work all to themselves. Here they have it.

Up to date there has been too little exchange of data and opinions on this topic among manufacturers, metallurgists, and technicians generally. This book is a good start in this direction. The progress from melting in crucibles to manufacture in the Siemens-Martin furnace has been of inestimable value to the automobile industry; but there has been no thorough compilation of data concerning all the different varieties of special steels as applied to special purposes.

This little book takes up very practically and thoroughly the matter of testing for elasticity, tensile strength, hardness, etc., by all the approved practical methods known to the technicians. It then proceeds to metallography, with special reference to the influence of manganese, nickel, chrome, and tungsten. Next it treats of the manufacture, as such, of auto steels, going into the details of melting, casting, forging, and rolling, with particular reference to the character of the surfaces attained. Tempering, welding, cold drawing (with its advantages and disadvantages) and general machining, etc., receive careful and competent attention.

The chapter entitled "Auto Steels" covers the ordinary carbon varieties, re-adoption of the so-called silicon steel

(0.10 C., 0.50 to 0.80 Mn., 0.70 to 1.00 Si.) is taken up. As this steel has a very high elastic limit (60 to 70 per cent as against the usual 50 to 60) it is well worth attention.

Case-hardening of ordinary and ternary steels, with particular attention to the discovery and the elimination of defects, especially warping, receives due consideration. Krupp succeeded in doing away with this evil by giving a very high surface hardness—in fact, such steels would scratch glass. The use of chromium is recommended in this connection. The author gives space to mention a process long known in the laboratory, but not sufficiently adopted in practice, namely, the employment of at least 6 per cent of nickel and about 0.5 to 1 per cent of chromium to prevent warping. Steels with this composition, cooled slowly in the air from about 800 deg. C., show the self-hardening quality, their surfaces being glass hard.

The chapter on tempering, as the word is usually employed (meaning hardening and drawing) is especially instructive and interesting, the more so as it is enriched with numerous tables showing the physical properties of various kinds of steel, each with various percentages of alloy.

Balls and rings for bearings get a chapter for themselves. Magnet steels, for both permanent and electro magnets, are taken up in detail. There is a very good section on ball-valve steels.

Taking it by and large, this little book is better worth its cost than nine out of ten of the technical works that have come under the reviewer's observation for a long time.

How to Test and Grade Foundry Sands

Standard and Tentatively Adopted Methods of Testing and Grading Foundry Sands. (1928). Pages 94, 6 x 9 in.; illustrations, 31, paper covered. Published by American Foundrymen's Association, 222 West Adams Street, Chicago. Price, \$3.

This publication is a revision of the foundry sand test methods issued by the joint committee on molding sand research in 1924, and contains in addition descriptions of testing procedures developed since 1924.

Controlling specifications are given, with general information as to methods of conducting tests and details of construction of apparatus which has been found satisfactory for performing the tests.

The book is divided into five sections: (1) Foreword; (2) Standards; (3) Tentative Standards; (4) List of Manufacturers of special testing apparatus; (5) Bibliography.

New 42 and 48-In. All-Geared Motor-Driven Lathes

UNUSUALLY heavy all-geared transmission is a feature of a "Lowdrive" lathe of completely new design which has been brought out by the Bradford Machine Tool Co., Cincinnati.

The unusually heavy all-geared drive is made possible by placing about two-thirds of it under the head and down in the bed where six selective initial speed changes are controlled and locked by a single lever. From the speed gearing, power is transmitted by heavy flexible chain to the initial drive in the lower front part of the head. The downward pull

the drive to the spindle is disengaged. The faceplate drive is controlled by a large lever which moves the engaging pinion into or out of mesh with the internal face gear. With this drive engaged, the operator uses the apron control to start, stop and reverse the lathe spindle.

Power rapid traverse is available for traversing the carriage in either

ings. The system includes an automatic oil-pressure accumulator which discharges oil at a pressure of about 300 at fixed intervals as long as the lathe is running.

The lead-screw is 2 7/16 in. in diameter and has one thread per inch. Being used for thread cutting only, it is not splined. The lead is guaranteed to be accurate within 0.001 in. in 18 in. for the full length of the thread. Screw cutting and power

The 42-In. Lowdrive All-Geared Lathe Is at the Upper Right. The planer type bed with pawl rack for the tailstock and power rapid traverse motor is shown in the view above. A close-up of the head, with guards removed, is at the right

of the chain, which increases with heavier cuts, is emphasized as an important factor in securing rigidity between the head and bed. This arrangement is patented.

In addition to the spindle, the head itself carries a back-gear drive and a triple or faceplate drive, as well as a direct spindle drive. The construction permits use of a tumbler in the head for the "feeds" and "threads," as well as a mechanism having two coarse screw ratios (4 and 20) which materially increases the thread and feed range listed on the regular index plate. A lead of 20 in. is regularly available. Eighteen spindle speeds, forward and reverse, ranging from 1½ to 175 r.p.m. are obtainable. A spindle brake acts automatically when

direction along the bed, for the carriage cross-feed screw and tool rest, and for the angular feed to the compound rest top. This traverse is engaged simply by holding down a lever on the carriage until the required movement has been effected. The independent motor on the bed, at the tailstock end, provide for all power traverse requirements. It is impossible to engage the power rapid traverse until the power feed has been so engaged and vice versa.

Oiling of each bearing is automatic, fresh oil being supplied according to the requirements of the different bear-

feeding cannot be in simultaneous engagement. The quick-change gearing for obtaining the various threads and feeds is of the company's standard design.

A 25-hp. constant-speed motor which runs continuously in one direction is usually furnished for the machine. Starting and stopping of the motor is from a push button station on the head, or at one or more other places on the machine if desired. Independent starting, stopping and reversing of the lathe is effected by a

(Concluded on page 1474)

Face Milling Machine Adapted for a Variety of Work

KEARNEY & TRECKER CORPORATION, Milwaukee, Wis., has added to its line of Mil-Waukee-Mils the new Broadside here illustrated. Like other Mil-Waukee-Mils, this machine is built on the unit plan and may be adapted for a variety of production face milling jobs.

The new machinery has for its foundation the standard Simplex and Duplex Mil-Waukee-Mils described in

8½ in. in diameter and the one at the rear 6 in. On the rear of the faceplate and integral with it is a 4 pitch 20½-in. diameter internal gear with 82 teeth. This gear is driven through a shaft and pinion and large spiral bevel gears and the ratio of the drive pinion to the internal gear is approximately 8 to 1.

A feature is the use of flywheels in the cutter drive. It will be seen from

Use of Flywheels in the Cutter Drive, Shown in the Line Sketch Above, Is a Feature of the Broadside Face Miller

THE IRON AGE of Sept. 15, 1927. By replacing the standard horizontal spindle head on a Simplex with the new face milling head the Simplex machine becomes the Broadside. In like manner two of these heads may replace the standard heads on the Duplex, or, if desired, just one of the Duplex heads may be replaced. Like other Mil-Waukee-Mils the new machine can be furnished with either 14 in. or 22 in. width tables and with seven power feeds ranging from 2 to 11 ft.

Cutters up to 24 in. in diameter may be used. The head is fitted with the new standardized spindle nose. The larger diameter cutters are driven by clutch keyways with the cutters held to the faceplate by means of bolts. Timken bearings are used throughout and automatic lubrication is provided. The main spindle, which carries the faceplate, is 5¾ in. in diameter and is mounted in Timken bearings, the one at the front being

the accompanying sketch that, in addition to the driving pinion shaft, A, which drives the internal gear, there is an auxiliary free running shaft, B, driven by the internal gear. Both shafts carry flywheels that revolve at eight times the main spindle speed. It is stated that with this arrangement the driving shaft flywheel prevents "kicking back" of the cutter as each tooth of the cutter bites into the metal; similarly the auxiliary shaft flywheel prevents the "jumping ahead" of the cutter as each tooth leaves the cut. The two flywheels thus maintain a neutral action, with one set of forces counterbalancing the other, the result being smooth flow of power at the periphery of the cutter. Twelve spindle speeds, ranging from 6 to 60 r.p.m., are obtainable by means of pick-off gears. The head cannot be furnished with quick-change gears. Eighteen changes of feed, obtainable either by pick-off gears or quick-change gear box, are provided.

Annealing Pot of Stainless Iron Welded to Steel

STAINLESS iron, welded, forms the Fuzon annealing pot, made by the Chicago Steel & Wire Co., 103d Street and Torrence Avenue, Chicago. Annealing with this new pot is said to cut time and cost almost in two. The pot, which weighs 660 lb., takes the place of a cast steel pot weighing 3300 lb. Each pot holds about 2000 lb. of wire. Consequently, when annealing wire in the new stainless iron pot, it is necessary to heat only 2660 lb. of metal, whereas with the old cast steel pot 5300 lb. of metal must be heated.

At the annealing point of wire, 1350 to 1400 deg. Fahr., this stainless iron shell has scarcely taken color. Consequently there is no sign of scale over its surface or interior. Because of the rapid scaling action that takes place when heavy cast steel pots are heated and cooled, the metal in them has to be so thick that they will last some time. With stainless iron pots the life should be almost indefinite.

The Fuzon annealing pot is about 7 ft. high and has an outside diameter of about 24 in. The body of the pot

is made of 14-gage stainless iron, 18 per cent chromium with 8 per cent nickel. It has a wrought steel base plate ¾ in. thick and a wrought steel collar on top, about 1 in. thick. Eight carbon steel rods, ½ in. in diameter, are welded to the collar and to the base to take the lift. A steel plate is welded inside of the pot, so that the coils of wire may easily be removed and will not be caught in the corrugations of the outside shell.

The shell of the pot is first formed and riveted, the riveting being pri-

Welded Annealing Pot of Stainless Iron

marily for the purpose of retaining the proper shape, and not to afford extra strength.

Carbonizing Pots of Welded Heat-Resistant Steel

Welded pots for case hardening and annealing are being placed on the market by Mossberg Pressed Steel Corporation, Attleboro, Mass., under the trade name Mephisto. The company has produced a line of welded steel products since 1920, among which are vulcanizing pans. To improve upon the conventional galvanized pan, a special steel has been used, capable of resisting corrosion due to the sulphur and steam from the rubber compounds. Such construction also calls for special welding rod and technique, so the joints may be equally resistant. During experiments designed to improve this material even further, an alloy and welding process was discovered which has resisted oxidation at 1800 to 2000 deg. Fahr. Comparative tests show that a welded pot of Mephisto metal acquires merely a thin, tightly adherent scale under conditions which would destroy a similar pot made of 3/16-in. boiler steel plate.

Baker Articulated Tilting Truck Will Load Approximately 500 Tons of Sheets in a 10-Hr. Day, Putting a Package Weighing from 6 to 10 Tons in a Car in 10 or 12 Min.

Truck Loads Steel in 10-Ton Packages

AFTER more than a year of development work, the Baker-Raulang Co., Cleveland, has put on the market an electric storage battery truck which will load 10-ton packages of sheet steel into box cars without danger of breaking through car floors.

The new truck is known as the Baker type D-96 articulated tilting truck. It is articulated, or hinged, in the center. This hinge enables it to make the very short turn from the loading dock through a 6-ft. car door with a package as large as 48 in. wide and 102 in. long. In operation this truck is like a one-horse wagon, if the horse were turned around in the shafts and faced the wagon.

The power section carries the bat-

tery and the driving and steering apparatus. The load section consists of a tilting platform mounted on a single axle and includes the hoist for tilting the platform and a double drum power winch.

Sheets which are to be handled by the Baker truck should be provided with 2 x 4-in. wood skids and firmly strapped together. The truck will pick such a package up from the floor, but in order to handle the maximum tonnage the packages should be placed on the truck platform by means of an overhead crane. The steel is usually weighed just before it is loaded, and when the crane picks it up from the scale the truck platform is run underneath. The truck

then carries the load from the scale and places it in the car. Under such conditions, and making ample allowances for delays, the truck will load approximately 500 tons of sheet in a 10-hr. day, putting a package weighing from 6 to 10 tons into a car in from 10 to 12 min. In tests packages have been repeatedly loaded into cars within 6 min., but in regular operation delays will nearly double this.

Under the present system, two men will load approximately 80 tons of sheet per day by hand. Accordingly, this truck, with an operator and a helper, will replace 12 men and will eliminate damage to the sheets as a result of scratching or rusting. Sheets larger than 48 x 102 in. can be handled, but automobile cars with 10-ft. door widths are required.

Hydraulic-Feed Horizontal Boring Machines

UNIT plan of design to permit adapting the machine for a wide range of work is a feature of the

or drilling heads. The center frame is made in various lengths according to the work-holding fixture required.

hydraulic-feed horizontal boring and drilling machine here illustrated, which has been placed on the market by Baker Brothers, Inc., Toledo, Ohio.

Essential units include the two end frames and the center frame. To the end frames are attached the sliding saddles, each of which is actuated by a separate Oilgear pump, and on the saddles are mounted the necessary single or multiple-spindle boring

The main heads are driven by individual motors mounted either on the heads or the saddles, as shown. The feed, which is controlled by foot pedals at the front of the machine, has the characteristic rapid advance and return of the Oilgear device and also the infinite number of adjustments of rate of feed. Use of two hydraulic pumps, one for each end of the machine, is emphasized as simpli-

The Single-Spindle Machine for Boring and Counterboring Rear Axle Housings Is at the Left. The machine below is for boring transmission cases

fying the piping and eliminating the necessity for an equalizing mechanism. A pressure gage on each hydraulic pump permits checking abnormal operating conditions, such as dull tools, undue hardness of material, incorrect chucking, etc., which conditions are indicated by the building up of high gage pressure. The saddles slide on unusually wide scraped ways and are proportioned to assure rigidity and alinement.

One of the machines illustrated is

fitted with two spindles in each head and with fixture and support for two boring bars for boring two holes in an automobile transmission case. In this installation two machines are employed, one for the roughing and one for the finishing operation. The second illustration is of a single-spindle machine with fixture for boring and counterboring cast steel truck rear axle housings. The machine is designated as the No. 25 H. H.

High-Pressure Continuous Service Pump

L EAD extrusion presses, used by rubber hose manufacturers for lead incasing hose previous to vulcanizing and by electrical wire and cable manufacturers for incasing ca-

which are bronze lined throughout. The main bearings are babbitt lined and the eccentric and main bearings are lubricated automatically from a 2½-gal. oil reservoir. The knuckle

Hydraulic Pump for Lead Extrusion Presses and Other Continuous High-Pressure Use

bles, require hydraulic pumps that will continuously deliver a large volume of water at high pressure. The hydraulic pump illustrated, built by John Robertson Co., 131 Water Street, Brooklyn, is designed for such continuous service and is furnished in sizes up to 50 gal. per min. and for working pressures up to 6500 lb. per sq. in.

The pump has a steel shaft with large diameter eccentric bearings

joints are bronze lined and work in oil. The plungers are of "non-rust" steel and operate in a forged steel pump chamber which is bronze bushed and fitted with removable bronze valve seats. The packing chambers are deep and easily accessible. Each pump is equipped with a hydraulic safety relief valve of sufficient capacity to relieve full discharge of the pump without a substantial increase in pressure.

Artificial Lighting in Industry

I N a pamphlet dealing with the use of Cooper-Hewitt lamps for lighting industrial buildings, much information is given on the subject of vision, its acuteness and its importance in the question of industrial lighting. The utility of producing sharp outlines is stressed, as this increases the contrast between surfaces. Examples are quoted in which this element has meant a definite industrial improve-

ment, either through a saving in labor costs or the turning out of a product containing fewer minute defects not discernible unless lighting conditions are particularly good.

It is stated that the yellow and green light rays constitute the best seeing rays in the entire spectrum, and these rays are said to form 90 per cent of the total rays emanating from the Cooper-Hewitt light. The remaining 10 per cent comes from the blue and violet end of the spectrum, while none whatever, it is said, comes from the red end.

Goggles With Helmet Attachment

G OGGLES attached to a skeleton helmet by fiber links have recently been added to the line of equipment for oxy-acetylene welding, manufactured by the Oxweld Acetylene Co., New York.

The goggles can be readily raised over the forehead or lowered over the

Skeleton Helmet with Goggles Attached

eyes with one hand; the bridge is adjustable and is covered with rubber insulation. Replaceable lenses, in standard size and colors, are used, the colored lenses being protected by cover lenses of clear glass. In another style the lattice skeleton cap is replaced by a fiber helmet, protecting the entire top of the head adequately. Both styles have leather adjusting straps at the rear.

New Paint Spraying Outfit

T HE Weil Lectrospray, a new electric spray painting device developing sufficient air pressure to spray liquid finishes, is being manufactured by the Weil Machine Co., Detroit, for economical painting or spraying in factories, warehouses and other buildings.

The Motor-Compressor Unit of the Spraying Outfit May Be Slung Over the Shoulder

The motor-compressor unit may be slung over the shoulder with the strap provided or it may be set on a bench or on the floor. This arrangement thus represents a departure from the usual practice in this type of gun.

By plugging into an electric light socket and snapping the switch, pressure is generated by the motor-compressor. The density of the spray is controlled by an adjustment of the nozzle.

New Method of Bundling Sheets for Shipment

STEEL sheet, especially full-finished automobile sheets, have been one of the most troublesome commodities handled by the railroads. When wood bracing is shattered by the shifting movement of piles of sheets, the steel is strewn all over the car. Even when the wood bracing holds, the

placed under the band at each corner. There was difficulty, however, in stretching and fastening the ends of the bands, and after working on sev-

Steel Bands and Corner Protectors of Sheet Steel Are Used in Strapping Bundles of Sheets for Shipment. The bands are fastened together with a Signode joint. Tool for making the joint is shown at right

shifting of the piles of sheets—which vary greatly in length—is sufficient to cause the shorter sheets to shuffle back and forth, resulting in scratching and curling up at the ends. As a consequence, many sheets have had to be returned to the mills for reconditioning.

About a year and a half ago, some of the mills, with the cooperation of the Consolidated Steel Strapping Co., 2600 North Western Avenue, Chicago, started experiments intended to do away with wood bracing by bundling the sheets with steel bands and allowing the unit to shift in the car. Progress was made, but without solving the problem.

The Fisher Body Corporation, Detroit, also began experimenting, using 2-in. x 16-in. gage bands and loading the bundles in gondola cars instead of box cars. The bundles were lifted into gondola cars by crane and covered with waterproof paper to protect the sheets from the elements. These shipments arrived in such excellent condition that the Fisher company decided to have all of its shipments made in this manner.

Bundles 20 in. high were put up with three cross bands around the steel only; 2 x 4 skids were strapped to the bundle with two or three longitudinal bands. Corner protectors made of sheet steel (about 6 x 6 in.) were

eral methods of fastening it seemed that welding was the only satisfactory means of fastening the ends; but welding required an experienced welder, and trouble was encountered because of heat going down through the top sheets.

The Consolidated Steel Strapping Co. then developed a simple stretcher and tool for making the Signode joint on a 2 x 0.050-in. band. After making several test shipments to the Fisher body plants, permission was obtained from that company for the mills to use this new Signode equipment.

The Fisher Body Corporation limits its bundles to 20 in. high, for convenient handling, and the average bundle weighs from 15,000 to 16,000 lb. Two 2 x 4 skids, running lengthwise, are used to allow the bundle to shift; otherwise the bundle would stick on the bottom and the top of the bundle would slide. Three crosswise straps are placed next to the steel, and the lengthwise straps are put on over the 2 x 4 skids. These bands are 2 x 0.050-in. material, tightened with a special "heavy duty" stretcher and fastened with the special tool for making the Signode joint. After the strapping operation is completed, the bundle is wrapped with Sisal Kraft waterproof paper, and then loaded by crane on gondola cars.

While gondola loading costs are higher per car than box car loading, the cost per ton is said to be just about the same, due to increased efficiency of handling in the mills by reason of strapping large bundles. For example, a bundle weighing 20,000 lb. can be strapped and covered just about as cheaply as one weighing 8000 lb. From 100,000 to 140,000 lb. can be loaded in a gondola, but only 80,000 to 90,000 lb. in the average box car. Advantages claimed for the Signode method are that it delivers

material in better condition; saves handling, which eliminates scratches; cuts down loading costs at destination; saves railroad equipment; cuts down claims on railroads, and reduces the amount of material rejected.

Some receivers request strapped shipments in box cars. Some of the bundles are strapped the same as for gondola loading, and some are loaded crosswise of the car. In crosswise loading the steel is strapped in small units of 4000 to 6000 lb., and five or six of these small units are strapped together with two or three bands into one large unit in each end of car.

To Control Combustion on Heating Furnace

THE Carnegie Steel Co. is having the American Heat Economy Bureau, Inc., install on one of the heating furnaces at its Duquesne works automatic control equipment for regulating the combustion of fuel in the furnace. Such control has established its value in a recent installation on a slab heating furnace, the heated slabs from which showed a very thin, uniform scale, which readily broke off at the rolls. The flame in the furnace is merely a haze at the rear.

Serious difficulty previously had been encountered in operating the

furnace. At times so much gas was fired that it burned at the stack or excessive scaling occurred, impairing the quality of the finished product. The automatic control is designed to admit only the desired amount of air to the furnace for the fuel fired and maintains this condition for all rates of firing. Under such uniform conditions, the scale loss on heating furnaces is reduced one-half or more, it is stated, while the fuel consumption is maintained at a minimum, dependent on the furnace design and the character of the steel heated.

Mileage Scale Attacked by Shippers

Proposed Freight Rate Changes on Iron and Steel Products Objected to by Mills,
Partly on Ground That New Tariffs Would Be Unreasonably High

WASHINGTON, Dec. 4.—The recent report of Examiners Howard C. Faul and C. M. Bardwell recommending a mileage scale of rates on iron and steel products throughout Official Classification territory was attacked by steel producers, consumers, Chambers of Commerce, railroads, port authorities, and others in briefs of exceptions filed last week with the Interstate Commerce Commission. A principal objection was that the scale carries levels of rates that are too high. But this objection was not voiced by the Chicago and related districts. Protests also were made against suggested rates for short hauls, especially by producers in the Middle West districts; proposed changes in relationships, the arrangement of mileage blocks, the maintenance of present differentials on eastbound traffic from Johnstown, Pa., and Cumberland, Md., and other points. Arguments probably will be heard before the commission the latter part of this month.

Steel Corporation an Objector

United States Steel Corporation subsidiaries filed exceptions to six recommendations. They objected to the conclusions of the examiners that the "level of the rates on iron and steel is of much less importance to shippers generally than is their relationship;" that "the principle of what the traffic can or will bear is a factor which must be given due weight;" that "the evidence is persuasive that, with certain exceptions * * *, rates on manufactured steel should be uniform or level throughout the territory under consideration;" that the scale to be adopted as a maximum reasonable rate scale be applied to the interstate transportation of iron and steel articles; that "in view of the peculiar conditions existing at Johnstown (Pa.) and Cumberland (Md.) * * * no objection be interposed to the retention of the present differentials on this traffic eastbound provided the same differentials are established on westbound traffic;" and that no origin grouping should be authorized in connection with hauls of approximately less than 150 miles.

Discussing the first exception it was contended that it was proved conclusively that the rates were unreasonably high. Ignoring the weight of the testimony showing the unreasonableness of the general level of the short haul iron and steel rates in the middle district, the brief said, the examiners start the scale at 6c. per 100 lb. Manifestly, it was urged, they have overlooked the controlling fact that there are different traffic and

transportation conditions existing within the Pittsburgh district, Mahoning and Shenango Valleys, Cleveland-Wheeling territories * * * which would justify a lower scale for this short-haul territory than that recommended for general application.

It was also pointed out that the examiners overlooked the important fact that the Monongahela, Allegheny and Ohio rivers afford to shippers in the Pittsburgh district a means of water transportation available throughout the entire year at rates appreciably lower than the scale recommended and that the establishment of such a scale in that district would drive away from the rail carriers the traffic which they are now enjoying at highly compensatory rates, with the consequent decrease in the carriers' revenues. It also should be remembered, the brief said, that the present scale of rates in the Pittsburgh, Mahoning-Shenango Valley, Cleveland-Wheeling districts are presumably now on a reasonable basis.

Claims Rates Would Be Unreasonably High

Excepting to the recommendation that "the principle of what the traffic can or will bear is a factor which must be given due weight," the brief said this contention is grounded on the fact that the examiners have ignored the element of reasonableness and have proceeded upon the false premise that the iron and steel traffic can bear unreasonably high rates, notwithstanding that during the course of the discussion they hold "it is the commission's duty in this proceeding to fix reasonable rates on steel." The brief sets forth a part of the scale proposed to support the argument that it would have the restrictive effect of long-haul rates. It is pointed out that over 62 per cent of the movement of steel is for hauls less than 300 miles and that when the length of the hauls from Pittsburgh to the large consuming markets in the East is reached the percentage of the longer movement is much less. It was declared that the short-haul rates in the middle district should not be increased because of the water competition situation and that they are more than amply compensatory, and finally that the long-haul rate from that district should be reduced because the traffic is not moving freely thereunder.

Regarding the recommendation that the rates on manufactured steel should be on a uniform level throughout Official Classification territory, the brief urged that consideration should be given to the transporta-

tion, commercial and competitive situation peculiar to the short-haul movement of iron and steel articles in the Pittsburgh and adjacent territory and that reasonableness should not be sacrificed for uniformity.

Scale Declared Unscientifically Drawn

The brief also maintained that the scale is unscientifically drawn. It was declared to be entirely too high in that the rates of progression are too rapid. Attention was directed to the fact that the rate for the first block, which is fixed at 6c. per 100 lb., was 20 per cent of the first class rate proposed for the first block in the Eastern Class rate case. Dealing with the proposed maintenance of differentials on eastbound traffic from Johnstown and Cumberland, the brief inquires as to why the differential relationship should be preserved to Johnstown and be denied to all competitive districts.

The finding that no origin grouping should be authorized in connection with hauls approximately less than 150 miles, the brief said, would work considerable injury to the competitive mills in the middle district, which have been developed under long established rate groupings on short-haul traffic, unless practical exceptions are permitted so as to mold the scale to fit into the exigencies of trade and commerce. The brief expressed the view that the establishment of groups on traffic involving distances under 150 miles would be in the public interest, but that such groups should be a matter of conference between the carriers and the industries involved, with the proviso that no carrier should be permitted to take out of the prescribed group a particular industry and accord to it a preferential rate, "such as the trunk line carriers in the Philadelphia steel producing district have been according to the favored competitor on traffic moving to the large metropolitan consuming district."

The brief made no objection to the retention of the Pittsburgh group as now constituted, provided that Pittsburgh is used as a central point from which to determine the mileage. But if the mileage from the Pittsburgh group is to be constructed on the average from all points in the augmented group, the brief said, exception will be taken to including Wheeling and related points.

Jones & Laughlin's Objections

The Jones & Laughlin Steel Corporation, Pittsburgh, made seven objections to the recommendations. It contended that the rates for long

hauls are unduly high in their relation to rates for short hauls under the proposed scale; that the level of rates in the scale for hauls in excess of 100 miles is unreasonable; that the level for hauls of less than 50 miles is unreasonable; that points in Ohio and West Virginia now included in the Pittsburgh group should not be constituted into a separate group; that the rates recommended do not give effect to the findings of fact; that the examiners erred in failing to recommend a scale having the progression and level of the scale proposed by F. A. Ogden, traffic manager of the Jones & Laughlin Steel Corporation, and that the scale proposed from five miles and under to 800 miles should not be adopted.

Objection was made to the scale because it names rates for the longer hauls, over 300 miles, that are unduly high in relation to the rates for shorter hauls, under 100 miles. The rate of progression was declared to be too high and the rates to increase too fast for successive distances or mileage blocks. It was contended that the purpose and effect of the scale is to prevent the middle district from shipping to or beyond the other districts, to keep the middle district out of the Atlantic seaboard market and West Coast business available by water only through seaboard, and also out of the St. Louis and Mid-Western market and other territory beyond whose rates base on Chicago or the Mississippi River. It was stated that the "blow dealt the (United States Steel) Corporation by the examiners hit also the middle district independents, including these exceptants." The net result of the scale, it was said, would be to reduce aggregate revenues by less than 5 per cent; that the reductions would fall more to the short haul traffic than to long haul, and that the scale accomplishing the reductions shall progress from 60 per cent of the Central Freight Association fifth class rate at five miles to 100 per cent of fifth class at 480 miles. In its exception that the level of rates for short hauls of less than 50 miles is unreasonable, the brief said that, with one-fifth of the total traffic moving less than 40 miles and a proposed increase thereon of about 40 per cent, it seems clear that some provision should be made in the final decision to take care of the short movements, 40 miles and less, taking place within so-called and arbitrary switching limits or elsewhere.

The proposed separation of Weirton and Wheeling, W. Va., from the Pittsburgh group, it was stated, would simply throw them $\frac{1}{2}$ c. or 1c. out of line with the familiar Pittsburgh rate basis. Quotations, it was declared, would under pressure of competition have to be made, as they are now, in contemplation of the Pittsburgh base price and freight rate. The $\frac{1}{2}$ c. or 1c. difference, it was contended, necessary to take into account on quotations, would be more hindrance and nuisance in the routine of selling and accounting than the money would be worth to the railroads. Finally, it

was declared that the proposed scale, or any other scale embodying full class rates for long hauls, and a substantially lower level of rates for short hauls, "will fail to remedy the discrimination or correct the unreasonableness of the present rates from Pittsburgh."

Valley Producers also File Exceptions

Steel manufacturers in the Mahoning and Shenango Valleys excepted to the report because of its failure to include certain sections in the territory involved, such as a section of Kentucky and Lake Michigan points reached by way of cross-Lake routes; because of its failure to carry fully into effect facts which, it was stated, warrant a lower rate scale than the basic scale and because of proposed maintenance of differentials on east-bound traffic from Johnstown and Cumberland.

The basic scale proposed was declared to be too high for both the long and short hauls. It was contended that a mileage scale should start at a lower figure than 6c. because of the existing short haul rate situation in the important iron and steel producing districts of Pittsburgh, Wheeling and Chicago and because of the competitive relationship between the iron and steel industries located in switching districts and industrial districts. The brief urged adoption of the Rhodehouse scale, which starts at 3c. and progresses at an increase of $\frac{1}{2}$ cent for each five-mile block, reaching the rate of 92.5c. for the 66 to 70-mile block, which is the present intrastate rate between Youngstown and Cleveland. The Youngstown interests, objecting to maintenance of the Johnstown and Cumberland differentials, asked application of the mileage scale basis from all producing points without exception.

Objection was made to any fourth section relief which will permit the direct lines by way of the Western gateways to publish a lower basis on iron and steel in carloads from Pittsburgh than from Youngstown to the Virginia cities and to points located on the Chesapeake & Ohio and Norfolk & Western railroads intermediate to the Virginia cities by way of the Eastern gateways. But whatever scale is prescribed, it was said, should be applied from Pittsburgh by way of the Eastern gateways and should not be equalized by the Western gateways, unless at the same time the same basis of rates is accorded the Valleys as is accorded Pittsburgh by way of direct routes through the Western gateways.

It was also urged that no change be made in the present rail-Lake and rail-Lake-rail rates to Duluth and the Twin Cities, regardless of the rate basis which may be prescribed within official territory. To permit the carriers to advance the rates to Duluth and the Twin Cities, it was said, would result in changing the competitive relationship of Youngstown and other interior points in official territory with other producing dis-

tricts, such as the Chicago district, to the destination territory, which is outside the scope of the proceeding.

Illinois-Indiana Shippers Also Object

Manufacturers and consumers in the Illinois-Indiana territory, through the Illinois-Indiana Shippers' Steering Committee, took exception to the proposed grouping and declared that the commission should reaffirm the principle of grouping as stated in the Jones & Laughlin rate case, which, in effect, provides that rates from and to each group, in the aggregate, average substantially the same as if made from and to each point separately. It was suggested that the establishment of groups of points of origin and groups of points of destination should in the first instance be left to the carriers, and that as to the making of rates to and from Milwaukee, which have always been made on an arbitrary over the Chicago rate, they should be continued to be made on that basis.

The Indiana State Chamber of Commerce, representing numerous producers and consumers in Indiana, excepted to the scale and submitted one of its own, providing a rate of 6c. for five miles and under up to 51.5c. for 1200 miles. The scale is carried in five-mile blocks up to and including 70 miles at a rate of progression of 10c. for each 100 miles. At 70 miles the scale is broken in 10-mile blocks up to and including 160 miles at a rate of progression of 5c. for each 100 miles on the theory that hauls for distances in excess of that are handled largely by through freight trains and the scale would be broken at a rate of 4c. for each additional 100 miles up to and including 500 miles.

In so far as iron and steel are concerned, the brief said, the Pittsburgh interests are striving to get into certain portions of southwestern Indiana and into Illinois in competition with producers located in the Indiana-Illinois territory. Here, it was stated, the element of competition should tend to decrease further the rate of progression, so beyond 500 miles the scale would be broken so that the rate of progression would be 3c. for each 100 miles. Under this scale, it was declared, consumers in certain portions of Indiana and Illinois would have the privilege of purchasing their steel in a highly competitive market.

[Briefs have been filed, also, by producers in the Philadelphia and Buffalo districts, by the Cleveland Chamber of Commerce, Milwaukee Iron and Steel Committee and others, and these will be summarized in the issue of Dec. 13.]

Directors of the General Fireproofing Co., Youngstown, have called a special meeting of stockholders on Dec. 4 to consider a plan for the exchange of the old common stock of the company for new stock on a four for one basis. The plan will necessitate increasing the authorized common shares from 200,000 to 500,000.

Operation of Stevens Steel Furnace

Open-Hearth Unit, Insulated and Incased in Steel, Is Subjected to Close Oxygen Control

WHEN the conditions are met that give the greatest thermal efficiency in the open-hearth furnace, a neutral atmosphere is automatically produced, and the furnace pressure is automatically made constant. It must be remembered that a neutral atmosphere depends upon the correct ratio of air to fuel, and any variation in furnace pressure causes a variation in volume of air induced. A neutral atmosphere improves metallurgical conditions, resulting in a greater yield and better steel.

According to a statement by Arthur L. Stevens, president Arthur L. Stevens Corporation, 205 West Wacker Drive, Chicago, the Stevens furnace is designed to meet these conditions. Regenerators are of a form and capacity, based upon data regarding heat absorption by brick and time of reversal, that give the maximum heat recovery and highest air temperature possible. All of the air for combustion is sent through the regenerators; this is done independently and is in no way related to stack draft. Stack draft is used only to take away the waste gases produced, and the pressure in furnace over the bath is kept constant at all rates of firing.

Air is supplied at constant pressure and is metered, as is also the fuel, so that the correct ratio of fuel and air is always maintained, and cold, infiltrated air is excluded. The flame temperature is raised, which

promotes fast melting. And, as the increased economy in the use of fuel and the exclusion of excess air reduce the volume of hot gases, there results a prolonged life for refractories.

Guarding Against Unwanted Air

To carry out this method the Stevens furnace is incased in steel, with specially constructed doors to insure against inward leakage of air. The regenerators are correctly proportioned for maximum heat effect and are insulated and incased in steel. Air supplied by a fan at a constant pressure is passed through an orifice meter, and this charge is calibrated with the fuel supply. Constant pressure is maintained in the furnace atmosphere. This means that high fuel economy is secured and a neutral atmosphere is automatically maintained.

Various patented devices are used in carrying out this plan and a broad patent has been granted for operating an open-hearth furnace with a neutral atmosphere maintained in this manner.

The first Stevens furnace to go into production is said to have cut fuel consumption sharply. The yield was increased and the percentage of pig iron used in the charge was reduced. The quality of steel was improved and the entire cost of installing the complete new furnace was saved in less than one year.

begun last week on the ground. When assembled these trusses will be hoisted into place whole, without disturbing traffic on Fort Street. When it is completed, about July 1, 1929, the Ambassador bridge will be the largest suspension bridge and have the longest span of any bridge in the world.

Aircraft Manufacturing to Adjoin Detroit Airport

The Detroit Board of Commerce and the Wayne District Association have announced plans for the organization of a \$5,000,000 corporation to undertake the immediate development of the Detroit-Wayne Industrial Airport, a tract one mile square, just outside the city of Wayne, which is 17 miles from Detroit.

Half of the tract will be sold or leased as industrial sites to manufacturers of planes, parts or accessories. The Stinson Aircraft Corporation has already purchased a 10-acre site and has begun construction on a \$250,000 plant, which, it is expected, will be completed in 60 days. Other aircraft companies are said to be considering locations at the industrial airport.

Buffalo Scrap Dealers Form Institute Chapter

The seventh chapter of the Institute of Scrap Iron and Steel was organized at a meeting held at the Hotel Statler, Buffalo, Monday evening, Dec. 3, and attended by 60 representative dealers and brokers from western and central New York. The following officers were elected: Charles Bock, president; Sol Morrison, first vice-president; L. Hurwitz, second vice-president; Ben Rosenthal, third vice-president; J. E. Farrell, secretary; Harry Roblin, treasurer; Joseph M. Maher, chairman executive committee.

Trade Practice Conference in Chicago December 12

WASHINGTON, Dec. 4.—The trade practice conference of the woodworking machinery industry with the Federal Trade Commission will be held on Dec. 12 at the Sherman Hotel, Chicago. The conference will be in charge of Commissioner G. S. Ferguson. An announcement by the commission said that a majority of manufacturers and dealers will be represented, and it is the desire of the commission and the industry that all others who have an interest in the subject consider themselves invited whether or not they have received an official announcement. Among trade practice proposed for discussion are inducing of breach of contract, fraud and misrepresentation, secret rebates, and price discrimination. Efforts will be made to provide for elimination of unfair commercial practices. The Association of Manufacturers of Wood-

working Machinery has drawn up a tentative list of rules which will be submitted.

World's Largest Suspension Bridge Nearing Completion

Construction of the \$26,000,000 Detroit-Windsor Ambassador bridge has progressed so rapidly that all of the cable work will be completed this week, according to Robert MacMinn, chief engineer in charge for McClintic-Marshall Co. Fabrication of the stiffening trusses in the central, over-river span, which is 1850 ft. long, will be begun before Jan. 1 and completed by April 1. On the Canadian side, 17 bays of the 29 bays of steel approach have been completed, and work on the Canadian side approach, including concrete, is about 75 per cent completed. On the American side work on two trusses each 140 ft. long, which will bridge Fort Street, Detroit, was

Use of Blast Furnace Slag in Bituminous Construction

Following several previous publications devoted to use of blast furnace slag, the National Slag Association, Cleveland, has put out Symposium No. 8, "Use of Slag in Bituminous Construction." This is a 60-page pamphlet dealing with application of slag aggregate or slag concrete to the construction of highways and other similar mass engineering projects. Quotations are given from a large number of publications and authorities, showing the requirements for this service, how well the slag fills these requirements, and many other pertinent matters connected with the subject.

Schedule of the next instalment of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Dec. 20—Position of Iron and Steel Producers.

Pig Iron Freight Rates from Granite City Reduced

WASHINGTON, Dec. 4. — Passing upon a complaint of the St. Louis Coke & Iron Corporation, Granite City, Ill., the Interstate Commerce Commission in a decision made public last Wednesday held that rates on pig iron in carloads from Granite City to certain deliveries in the St. Louis district, to Cape Girardeau, Mo., and to Springfield, Mo., are unreasonable and unduly prejudicial. Rates on pig iron from Granite City to certain other destinations in Central, Western trunk line and Illinois territories were found not unreasonable or unduly prejudicial. These latter destinations included points in Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, Ohio and Wisconsin.

The new and old rates from Granite City in gross tons, to the St. Louis, Cape Girardeau, and Springfield districts, follow:

	New Rates	Old Rates
St. Louis.....	75c.	56c.—\$1.23
Cape Girardeau ...	\$3.18	\$4.26
Springfield	4.00	4.50

The new rates are to become effective Jan. 10. To destinations on the rails of the Terminal Railroad in the St. Louis switching district a rate of 56c. now applies from Granite City for distances ranging from six to 15.5 miles and averaging about nine miles. To deliveries on other lines in the district, the distances from Granite City range from 14 to 22 miles and average about 19 miles. To most of the deliveries in the district on the Missouri Pacific and to at least one delivery in the district on the Frisco Lines a joint rate of 75c. applies. To other deliveries on connecting lines in the district, combinations apply from Granite City, composed of the 56c. rate of the Terminal Railroad, plus the switching charge of the delivering line. These combinations range from 83c. to \$1.23. Fourth section violations, which had been complained of through failure to establish certain joint rates, were said by the commission to have been removed.

South African Steel Plant of 150,000 Tons Capacity

Plans for South Africa's new State-owned steel plant were outlined by the new corporation's chairman on the eve of his departure for Europe to look into the matter of steel production and select the technical expert who will guide the destiny of the venture, according to the Department of Commerce.

Initial production of 150,000 tons per annum will be aimed at, according to his statement, the department is informed by Trade Commissioner Samuel H. Day, Johannesburg. Importations of raw steel are at present about 300,000 tons. Manufactured steel products made by new subsidiary industries are expected to take another 150,000 tons of raw steel. The

value of steel imported into South Africa in 1927 was £2,500,000, and in 1926, £3,000,000.

Thus, if the corporation obtained the whole Union market and had the benefit of the demand of subsidiary industries for products that could easily be made in South Africa, the total eventual production might be as high as 500,000 tons per year, it is said.

Emphasis was placed on the new company's policy to treat all suppliers, whether British, German or American, on a fair and equal basis in calling for tenders for plant equipment. No contracts were to be placed during the coming European trip, since these were to come only after prolonged study and arrival at final details by the staff of experts.

Booklet on International Foundrymen's Congress

A 44-page illustrated booklet has been issued giving the details of the arrangements for the Third International Foundrymen's congress to be held in London, England, June 11 to 15, 1929. It contains full information regarding the various tours and other arrangements that have been made for the convenience of American foundrymen who expect to attend. The booklet, prepared under the supervision of the committee on international relations of the American Foundrymen's Association, is being distributed by the association and by the official travel agents, Thomas Cook & Son, 585 Fifth Avenue, New York.

A general description of the Third International Foundrymen's congress follows a foreword by S. T. Johnston, president A. F. A. Subsequent sections describe the arrangements that have been made for plant visitation, sightseeing, and the official tours. The latter section, which is very complete, includes detailed itineraries and quotes rates of fare covering the trip to the London congress itself, the official pre-convention tour of Great Britain, and a choice of three post-convention tours covering attractive sections of the continent of Europe.

An American foundryman may attend the Third International Foundrymen's congress for as little as \$391 from New York, including round trip cabin steamship accommodations, hotel rooms in London, breakfasts while ashore, local sightseeing, entertainment, etc. The most elaborate tour listed covers most of England and Scotland, Belgium, Germany, Switzerland, Italy and France.

The booklet is illustrated with reproduction of events at the First International Foundrymen's congress in Paris in 1923 and typical European scenes. Copies may be obtained from the official travel agents, or C. E. Hoyt, executive secretary American Foundrymen's Association, 222 West Adams Street, Chicago.

Study of Metallurgical Problems at Pittsburgh

The current year's program of the metallurgical advisory board of the Carnegie Institute of Technology and the United States Bureau of Mines on which five research fellows, one research engineer and an assistant and an analyst now are at work under the instruction of a group of men from the Pittsburgh station, United States Bureau of Mines, embraces the following problems:

Physical chemistry of steel-making (plant work), by C. F. Christopher, research engineer, University of Pittsburgh, metallurgical engineer, who will have A. D. Myer as assistant and J. F. Sanderson as analyst in the work.

A study of the cause and control of abnormality in case-carburized steel by J. E. Jacobs, Carnegie Institute of Technology, metallurgical engineer, class of 1928.

Formation and identification of inclusions by M. F. Judkins, University of Washington, chemical engineer, class of 1928.

Distribution ratio of iron oxides between slag and metal by W. O. Krebs, Yale University, chemical and metallurgical engineer, class of 1928.

Method of determining inclusions by W. E. Marshall, Georgia School of Technology, chemical engineer, class of 1927.

Viscosity of open-hearth slags by Kenneth Metcalfe, Rose Polytechnic Institute, chemical engineer, class of 1928.

The Bureau of Mines instructors in charge of Dr. C. H. Herty, Jr., are: J. M. Gaines, Jr., B. M. Larsen, G. R. Fitterer, H. Freeman and P. W. Edeburn.

Montclair, N. J., Adopts Institute's Specifications

The standard fireproofing specifications, as drafted by the American Institute of Steel Construction, have been adopted by the city of Montclair, N. J. This is the first city in the United States to take such action. The ordinance adopted by Montclair as an amendment to its building code reads:

"The fireproofing of structural steel shall conform to the standard specifications for fireproofing structural buildings of the American Institute of Steel Construction, dated Oct. 8, 1927."

The Florida Building Officials' Conference unanimously adopted on Nov. 17 a uniform building code which includes in its entirety the institute's standard specification for structural steel for buildings. This building code was immediately accepted by the city of West Palm Beach and will be adopted by all of the larger cities of Florida by ordinance, as the Building Officials' Conference has no mandatory powers. The State of Florida purposes to have legislation enacted ultimately making the use of the new code compulsory throughout the State.

Fabricated Structural Steel

Awards of 42,400 Tons Include Several Large Jobs— Chicago Office Building Will Take 10,000 Tons

AWARDS during the last week totaled 42,400 tons. Of outstanding size were 8600 tons of plates and shapes for a ship to be built at Chester, Pa.; 7200 tons for an insurance building at Hartford, Conn.; 5600 tons of shapes and sheet steel piling for a railroad warehouse at Jersey City, and 5000 tons for an office building at Boston. New projects, calling for 27,400 tons, included 10,000 tons for an office building at Chicago. Awards follow:

BOSTON, 5000 tons, United Shoe Machinery building, to New England Structural Co.

BOSTON & MAINE RAILROAD, 1400 tons, 12 bridges, to Boston Bridge Works, Inc.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD, 250 tons, freight shed, to Palmer Steel Co.

HARTFORD, CONN., 7200 tons, building for Etna Life Insurance Co., to Levering & Garrigues Co.

WHITE PLAINS, N. Y., 365 tons, Peoples National Bank Building, to Hay Foundry & Iron Works.

NEW YORK, 2200 tons, office building at Madison Avenue and Forty-seventh Street, to Levering & Garrigues Co.

NEW YORK, 785 tons, apartment building at 423 East Eighty-sixth Street, to Paterson Bridge Co.

NEW YORK, 520 tons, apartment building at 237 East Twentieth Street, to A. E. Norton, Inc.

NEW CITY, N. Y., 900 tons, Rockland County Hospital buildings, to unnamed fabricator.

ASBURY PARK, N. J., 1500 tons, convention hall, to Hedden Iron Construction Co.

Jersey City, 5600 tons, 1600 tons in column cores for Delaware, Lackawanna & Western terminal, to Levering & Garrigues Co., and 4000 tons of sheet steel piling, to Bethlehem Steel Co.

CHESTER, PA., 1600 tons of shapes and 7000 tons of plates for ship to be built by Sun Shipbuilding Co., to Carnegie Steel Co.

PITTSBURGH, 400 tons, apartment building, to McClintic-Marshall Co.

CLEVELAND, 700 tons, plant for Geometric Stamping Co., to Austin Co.

FLINT, MICH., 900 tons, Flint Auditorium, to Flint Structural Steel Co.

PONTIAC, MICH., 100 tons, truck repair building for Fisher Body Corporation, to R. C. Mahon Structural Steel Co.

STATE OF INDIANA, 600 tons, highway bridges, to Rochester Bridge Co.

CHICAGO, 345 tons, store and loft building, to Duffin Iron Works.

CHICAGO, 150 tons, warehouse for John Sexton & Co., to Wendnagel & Co., local.

GREEN LAKE, WIS., 375 tons, club house, to Vulcan Mfg. Co., Fond du Lac, Wis.

MONTICELLO, MINN., 800 tons, bridge, to Minneapolis Steel & Machinery Co.

KANSAS CITY, MO., 425 tons, Klein Building, to Kansas City Structural Steel Co.

PARADISE, MONT., 570 tons, Clarks Fork bridge, to unnamed interest.

LA HABRA, CAL., 100 tons plates, riveted pipe line, La Habra Heights subdivision, to Western Pipe & Steel Co.

SAN FRANCISCO, 2870 tons, Methodist Book Concern hotel, McAllister and Leavenworth Streets, to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 480 tons, store and office building on Newbury Street.

BOSTON, 110 tons, Boston Elevated Railway garage.

PORTLAND, ME., 500 tons, Maine General Hospital.

NEW YORK, 1000 tons, apartment building at 37 West Seventy-second Street; James Stewart & Co., Inc., general contractor.

NEW YORK, 700 tons, apartment building at 4 East Seventy-second Street; George A. Fuller Co., general contractor.

NEW YORK, 200 tons, building at Broadway and Sixth Avenue for John David store.

STATE OF NEW YORK, 150 tons, highway bridge.

STANDARD OIL CO. OF NEW JERSEY, 1000 tons, five tanks.

PHILADELPHIA, 500 tons, office building at Sixty-ninth and Market Streets.

BALTIMORE, 100 tons, building for Stone & Webster, Inc.

ERIE, PA., 2000 tons, building for Erie Dry Goods Co.

LOUISVILLE, 1600 tons, approaches to highway bridge spanning Ohio River.

CINCINNATI, 140 tons, municipal garage.

CINCINNATI, 2000 tons, building for Union Gas & Electric Co.; George A. Fuller Co., general contractor.

CLEVELAND, 600 tons, Robert Fulton and Louis Agassiz schools.

YOUNGSTOWN, tonnage unstated, seventeen-story building for Central Trust & Saving Co.

FLINT, MICH., 1500 tons, Union Trust Co. building.

DETROIT, 800 tons, section 5, Detroit-Windsor tunnel, including Customs building and Detroit approach.

DETROIT, tonnage unstated, *Detroit Times* building.

CHICAGO, 10,000 tons, office building at 1 North La Salle Street.

CHICAGO, 1000 tons, First Regiment Armory; Mississippi Valley Structural Steel Co., low bidder.

MINNEAPOLIS, 1400 tons, Northwestern National Bank building.

PRAIRIE DU CHIEN, WIS., 1300 tons, highway bridge.

BARABOO, WIS., 280 tons, Federal aid bridge across Wisconsin River at Delton; general contract awarded to Fischer & Yahr, Wausau, Wis.

New Steel Putty Drums

The Geuder, Paeschke & Frey Co., Milwaukee, has added 50-lb. and 100-lb. putty drums to its line of Wedg-Seal containers. These drums have the Wedg-Seal patented inclosure designed to keep the oil from leaking out and are constructed to withstand handling and shipping abuse. It is claimed that this permanent tight seal is necessary to keep the putty in perfect condition, and after opening it can be resealed securely, eliminating the need for adding oil.

Steel Water Tank and Look-out Platform

WENTZ CAMP, 4 miles northeast of Ponca City, Okla., is a boy scout camp of 160 acres on which barracks have been erected and improvements made to accommodate 1000 boys. One of the first things the visitor sees is the combined water tank and lookout, shaped something like a giant scepter.

The spherical portion, 21 ft. in diameter, holds 30,000 gal. of water, which is used as a general supply. The tower or cylindrical portion, 7 ft. in diameter and 75 ft. high, incloses a circular stairway which extends through the tank to a platform 10½ ft. in diameter. This observation point, 94 ft. above the ground, is surrounded by a lattice fence and equipped with a telescope and searchlights.

Steel plates used in building this structure range from 5/16-in. to ¾-in. thick. They were fabricated at the western plant of the Chicago Bridge & Iron Works and erected by one of that company's field crews. A swimming pool and additional buildings are under construction.

This Issue in Brief

Cuts costs and improves quality of work by freeing machine operators from "common labor" work of lifting and carrying. Truck builder finds it pays to install short gravity conveyors to carry heavy parts from machine to machine.—Page 1426.

* * *

Arc welding induces large "negative" or compressive stresses in steel plate adjacent to the weld, investigator finds. These deformations persist even after the welded bead is milled off.—Page 1429.

* * *

Impartial and rigid inspection of manufactured parts is insured by having inspectors report directly to engineering department. In this way sympathetic connection between production department and inspectors is avoided.—Page 1419.

* * *

Dead stock is kept out of stock-room by selling material unused in six months. "Corpses" are cleared by systematic sale of dead items. Purchasing agent is made responsible for sale of materials no longer used.—Page 1421.

* * *

Instead of buying more core ovens, foundry substituted gas fuel for coke. The change increased output to such an extent that existing equipment yielded increased product.—Page 1424.

* * *

Accident hazard not increased by greater mechanization. By placing employees' safety first when laying out or purchasing new equipment, iron mines have been able to keep down accident rate, despite considerable increase in mechanical equipment.—Page 1431.

* * *

Forty-three million dollars' worth of American machinery was shipped abroad in October. This is a gain of 32 per cent over September. Machinery exports for first 10 months are 13 per cent above same period of 1927.—Page 1480.

Takes the "guess" out of manufacturing for stock by budgeting production according to surprisingly accurate sales forecast index. Valve and fittings manufacturer found that his sales curve fluctuated almost exactly in parallel with composite curve based on operations in industries in which his product is used. Now he can tell ahead whether to cut production or to prepare for increased orders.—Page 1431.

* * *

Structural fabricator gages bar lengths quickly by placing the bar to be cut in a long channel, in which holes are cut at 3-in. intervals. Foot marks are stencilled on the channel. The holes accommodate a gage block, permitting accurate measurement to be made almost instantly.—Page 1434.

* * *

Storm of protest raised by proposed mileage freight rates on iron and steel. Consumers, producers, railroads, Chambers of Commerce and others file protests before Commerce Commission. Producers say rates would be unreasonably high. They deny that rates should be on a uniform mileage level, and furthermore claim that the scale is unscientifically drawn.—Page 1442.

* * *

Prophecies steadily increasing foreign trade. Dr. Klein foresees steadily increasing export business for American manufacturers. World buying power is growing, he says, and will grow as long as peace prevails.—Page 1478.

* * *

Lowers production costs by means of simplified stock control. Simple system enables cash register manufacturer to keep track of 52,000 parts, using only 28 different forms. Elaborate records, with accompanying costly clerical force, are eliminated.—Page 1420.

Manufacturing heads must know something about markets, and sales executives must know something about manufacturing, if the business is to prosper to the utmost. The old, neatly drawn divisions are too narrow for modern industrial executives, for manufacture in many lines is in a state of flux, calling for men who can see and comprehend the business as a whole—not just one part of it.—Page 1448.

* * *

Reduces money tied up in stock. As motor trucks are now built to specification, Cleveland plant no longer makes stock models, but keeps stock liquid by maintaining it in the form of finished machine parts, sub-assemblies and partial assemblies. Final assembly is made to meet the specifications of the customer.—Page 1425.

* * *

Work goes through the plant in the same tote box. Material in process in the N. C. R. plant goes from operation to operation in the same box. Accompanying the box is a stock card on which each department foreman marks the quantity of parts processed, the check number of the operator, and the date work was finished.—Page 1423.

* * *

Pig iron output establishes new post-war November record. Daily rate of 110,084 gross tons attained last month is highest November rate since 1918. Gain over October was 1.15 per cent. On Dec. 1 there were 194 furnaces in blast, a loss of 3 during the month.—Page 1452.

* * *

No bewhiskered cost figures here. Cost records are never more than 5 hr. behind the actual work. As soon as work on a certain order is completed, department clerk in cash register plant sends labor ticket to stock ordering department. In this way, not only are cost figures kept up to date, but duplicate payment to workmen is prevented and the location of the work is always known.—Page 1423.

THE IRON AGE

ESTABLISHED 1855

Higher Convention Standards

ONE who attended the recent convention of the National Founders' Association in New York could not but realize, if he had had similar contact with the association in its earlier years, that the old order has changed, in fact, has been revolutionized. Those conventions of the early nineteen hundreds rang with high-pitched notes of labor conflict. Hours were given to reports from all parts of the country telling of strikes by the molders' union to enforce demands for higher wages or, as in many cases, for shop control with regulation of output, high minimum wage, limitation of employment of handy men on molding machines, and all the rest of the union program in opposition to the open shop. The whole atmosphere of the annual gatherings was charged with militancy.

Partly because the open shop has steadily made headway in the foundry trade, partly because the molders' union has somewhat modified its old views in respect to modern production methods, but chiefly, perhaps, because high wages have come to stay in all industry—at all events the latter-day conventions of the National Founders' Association have lost the old note of militancy. The same is true of the like gatherings of the National Metal Trades Association.

Instead of recounting their engagements with the embattled hosts of unionism, the founders and the men of the metal trades make their annual meetings more like Chautauquas in economics, Government relations to industry, production management, cost accounting, modern marketing, and all the movements that have been remaking industries in the decade since the great war. With manufacture in many lines in a state of flux, executives in the metal-working industries are turning these meeting places into centers of education and of constructive effort. They recognize that leaders in industry today must know much more and about many more things than their predecessors needed to know 20 or 25 years ago. They are finding out also that once orthodox ideas of departmentizing their businesses are much too narrow for this day. Operating men now know that they must study markets and the developments in trade if they are to sit intelligently in conference with managers of sales. And sales executives equally appreciate that the old-time go-getter salesman is being succeeded by a type whose equipment includes much that was once left exclusively to the man in the shop. Thus convention programs take a wide range and appeal to all classes of executives.

What is happening in the association work of the foundry and metal-working industries is seen in manufacturers' organizations in all lines. The changed conditions of post-Armistice years call for bigger and

broader men as heads of industry, and the higher plane of the association convention of today is a distinct response to the new demand.

Is There a New Inflation?

IN a recent address before the Harvard Economic Society Colonel Ayres predicted that high industrial and commercial activity will continue into at least the early months of 1929, but expressed the opinion that this country is now experiencing an inflation; an inflation after \$500,000,000 of our gold (about one-ninth of our total stock) has gone abroad—which would be a new kind of inflation; and he declared that there are vague but real dangers in the increase of loans to brokers by corporations and individuals.

This opinion affords grounds for serious consideration, although exception may be taken to certain of the fundamental statements. Especially is it doubtful if our industrial and commercial activity be at so high a rate as is generally supposed. Many indices support the common belief, but none of our many composite indices of production is satisfactory, and we are lacking any such thing as a general economic index that is any more than a guess. It may be that we are experiencing dazzling activity in some branches of industry and backwardness in others.

There are perplexities in the existing economic situation in this country for which no good explanations are offered; and in the absence of such there are bound to be vague apprehensions.

It is a common belief, entertained by so competent a financier as Secretary Mellon, that our national income has attained the figure of about 90 billion dollars. This implies a remarkably rapid annual increase during the last few years. Income tax returns go some way toward supporting such a belief.

On the contrary, Dr. W. R. Ingalls, who makes an annual estimate that is published in the *Annalist*, reckons the internal national income in 1927 at 73 billion dollars, compared with 74.9 in 1926 and 73.5 in 1925. Doctor Ingalls makes this estimate according to a consistent formula. He also offers an accounting of the industrial income, according to statistics actually reported, into which enter none of the factors that play a part in the formula. The industrial accounting, in millions of dollars, is as follows:

	1925	1926	1927
Agriculture	13,034	12,985	*13,000
Mineral	5,678	6,213	5,520
Building (50 per cent) ..	3,300	3,480	3,470
Steam railroad	6,123	6,383	6,139
Public utility	1,827	1,995	2,113
Telephone	793	878	950
Manufacture	26,800	*28,000	*27,000
Total	57,555	59,934	58,192

The figures indicated by asterisks are more or less

conjectural, which is not, however, to imply that they are reckless guesses. The industrial accounting foots up to about 80 per cent of the total estimated by formula. Both methods give totals of a similar character, i. e., showing but small additions from year to year. This immediately raises two questions: how to account for the difference between 75 billion dollars and 90 billion, and how to account for great increases from year to year.

Some explanation may be found in the stock market. At the middle of 1926 the quotational value of all the stocks listed on the New York Stock Exchange was about 35 billion dollars. At the beginning of November, 1928, it was 61 billion, against which 5.9 billion was being borrowed. All of this great appreciation in nominal value has not been converted into income, either by way of dividends or liquidated profits, but some of it has. Thus the total of State income tax revenue in Massachusetts in 1927 was upward of 21 million dollars, which was about 5 million dollars more than normally, all of which gain is directly traceable to transactions in stocks.

Increases in national income in that way, therefore, may swell and distort the income reckoned as derived from industry, i. e., agriculture, mining, manufacturing, transportation, etc. But all income must be spent, either by the direct recipient or by some one else, unless it be converted into gold to be hoarded. The last certainly has not happened, for we have exported gold. Consequently, if it were really spent, it ought to be used in producing more goods. But irrespective of the exhibitions of single industries, or even groups of industries, our aggregate statistics do not reveal any such thing in any particularly noteworthy way.

A distinct and much discussed feature of the present situation is the great volume of loans on securities that are being made by others than bankers. This means that corporations instead of distributing their surplus among their stockholders, to be spent by them, and instead of themselves spending it for increased production (which they may deem to be temporarily unwise) are lending it to speculators and thus contributing toward the bidding up of security quotations. We have herein a good deal of a paper, or credit, situation, which is different from the physical and material; and presents good ground for apprehension that a reversal of the whole process will extinguish a good deal of fiction or inflation. If, when and as the bubble is punctured there will be losses instead of gains to be figured in income tax returns. Such a puncturing may occur through the withdrawal of corporate credit from the stock market and its use in the production of more goods.

We may draw a distinction, therefore, between goods income and goods plus credit income and this may explain in part the discrepancy between estimates of 75 and 90 billion dollars. It is conceivable that estimates on the former basis may increase while on the latter they are receding; but if so there might be more or less of discomfort in the process.

The retention of great surpluses by corporations looks economically dangerous and to be largely contributory to and explanatory of the existing situation. Let it be observed that, while the total loans on New York Stock Exchange collateral are only about 9 per cent of the total quotational value, probably the major

portion of the latter is owned outright and the loans are in a much greater proportion to the floating supply that changes hands. The corporate surpluses result no doubt from the inability of the corporations to use them in their own businesses, which are already overbuilt in general. If they were distributed to stockholders, the buying ability of the latter would be increased, which would be reflected in increased demands for goods; and excessive producing capacity would be more rapidly brought into use and some of the present paradoxes would disappear.

A Study of Wage Rates

UNCLE SAM finds the same difficulties in personnel management that confront any other large employer. Many of them resolve into the question of wages and salary. "What is the ruling rate for file clerk, for dictaphone operator, for messenger, for truck driver?" are questions which must be answered by anyone who attempts to pay a fair wage for standardized duties. The fair rate is doubtless affected by variable cost of living in different regions and by steady employment or safe tenure. But in any case some comprehensive information is necessary before Congress can act fairly on the prayers for salary adjustments being made by various groups of civil service employees.

For this very purpose the national Government's Personnel Classification Board is undertaking a comprehensive survey of current labor rates, both by field investigators and by questionnaires. As is the usual procedure, the individual returns will be confidential; the tabulated summaries, however, will be published not only for the benefit of Congress and other officials, but for every personnel manager in the country. It is therefore a matter of self interest for those organizations among the metal trades which are approached to procure and forward the desired information promptly. The successful termination of the investigation should not only benefit the great army of government employees, but be of value to economists, labor departments and progressive business executives generally.

The Quest for Business Stability

FOLLOWING a succession of years in which price variations have been narrow, the value of stable markets has won wide appreciation. Profits are being made not so much by luck or foresight as by increased industrial efficiency. Economies have been found in steady plant operations. To make production still more stable, all obstructions to the even flow of business are objects of attack. Organized efforts are being made to free industry from the unsettling and demoralizing effects of unfair competition. Methods of distribution are being studied to find new ways to reduce the cost of getting goods from plant to consumer.

In this connection cross-hauling of steel has been condemned as uneconomic. Yet, curiously enough, certain steel producers deliberately cultivate trade outside their natural markets to achieve the very stability that cross-hauling is said to disturb. On the theory that it is unwise to put all of the eggs in one basket, these companies aim to free themselves from the full effects of a possible local depression by having customers in other districts.

Along with the study of distributing methods, mar-

ket research is receiving more attention. By careful surveys, some manufacturers have succeeded in forecasting their bookings so accurately that great economies in production have been made possible. Finding out what the consumer is likely to buy has become one of the most fascinating of business problems.

In lines of manufacture where style is a factor, calculations of probable consumer demand are always contingent on a certain element of chance. It is well known that eye appeal now is a primary factor in determining the success or failure of automobile models.

Fortunately for iron and steel and machinery no uncertainties of style directly disturb stability. Economical output is virtually assured so long as sufficient demand can be found. To obtain this sine qua non, market research is valuable not only to forecast business but to develop new uses for products. The machine tool salesman has long been on the lookout for new applications for existing equipment and for opportunities to develop machines to fit new requirements. Some steel companies compile records of the tonnage needs of all consumers in their territories; others have profited by a more penetrating study. Knowing the customer's business is becoming not merely a desirable, but a necessary, part of the sales campaign.

Big or Little Business?

PERHAPS it is chiefly the item of brains that determines whether a given business enterprise will succeed better by being big or by being little. There has been a good bit of propaganda about big business, some of it merely by writers or speakers who saw a chance to show off by taking the side that was once unpopular. Yet we still hear a good deal of sound talk about cases in which little business is likely to get along better than big business.

For an illustration we have coal mining. For many years there has been altogether too much productive capacity. One might suppose that by this time a substantial proportion of the small mines would have been eliminated. The statistics show that this is not the case, and when the matter is submitted to men well versed in coal mining matters the rejoinder is: "Of course not. Bare production costs are about the same and the big concerns have much more overhead." Coal mining, if not relatively simple, is a thing on which one readily can secure all the requisite information, there being experts available and ample means for picking out the best equipment. The individual company does not need to possess much ingenuity or initiative.

Steel making might be supposed to be different, but one often hears in the steel trade intelligent references to cases in which the small steel mill will do the better, in highly specialized products. The small strip mills of Germany are mentioned in this connection. They measure their success by revenue rather than by tonnage. When, with a much smaller increase than formerly in the total tonnage, steel has been growing more and more diversified in character and has been passing into innumerable small uses, may we not reasonably infer that conditions are really growing more favorable for the small units? There was a time when costs were being reduced rapidly by mere bigness, but the bigness has gone so far, involving such heavy capital outlays,

that it demands tonnage, and when there is not tonnage it is at a corresponding disadvantage.

If bigness necessarily gives low final cost, and if erection of dwelling houses and other small structures is inefficient, how does it come that by this time we do not have one or more big companies operating throughout the country and putting up these buildings by the thousands? Following the theories accepted in so many quarters it could be demonstrated that here is a great field. The big company could have a much wider variety of plans, all tested and safe, for the customer to select from than is available when as now the prospect consults the individual architect. Yet the thing has not been done, and there must be a reason. Overhead may be one reason; the disposition of the average man to patronize an individual, who may be more sympathetic if not so intelligent, may be another.

If a great deal of research is necessary to make the best product, and if the means cannot readily be imitated, there is a reason for big business in such cases; but when it comes to secrecy the little business seems to have the advantage. To a considerable extent, it appears to be a question of whether or not a great deal of brains is required.

Right before us we now have argument and contest on this score in another branch of business, that of retail merchandising. The chain stores have been succeeding, but it is argued that if the individual storekeeper should use the same skill, not difficult to acquire, he will be able to hold his own in spite of the combinations' advantage in mass buying. If he does not, the case will not necessarily be proved, for many storekeepers do not display merely an average amount of ability.

What Makes a Good Joint?

AT the recent meeting of the International Acetylene Association, a manufacturer of refrigerating equipment stated that in the last five years not a single leaky weld had left his shop. A steam heating contractor also testified that no leaks had been reported in his welded installations in an equal length of time, nor could he imagine the circumstances which would induce one of his workmen to make a defective joint. A past president of the American Welding Society and a pioneer in the industry has stated publicly on many occasions that he has never heard of a failure in a weld made under procedure control. An executive of a company which has arc-welded hundreds of stills for petroleum refineries said that not one had proved defective at the joints, despite continued use at high temperature and pressure.

Over against this remarkable testimony must be placed the exhibit at a Government bureau, containing dozens of electric and gas "welds" which failed in service. We must consider the well-nigh universal feeling among the older engineers that the "weld is no better than the welder," and that even the best workman has his blue Mondays. Lastly, many have had unsatisfactory experiences with the repair man who attempted to fix a broken lawn mower, a gas engine block, or a piece of household equipment.

The reason for this contradictory situation is that the first four men referred to joints made under pro-

cedure control—that is, joints made with due consideration for the quality of the metal being welded, the design of the article, the welder's skill and equipment, his supervision, and the final inspection and test. All of these essentials are the result of good management. With them the result is satisfactory—would be satisfactory, indeed, no matter what the operation might be.

Riveting requires the same elements of procedure control. As the president of the Welding society (who is closely connected with a leading steel fabricator) has pointed out, engineers and the public generally accept riveting not because an inspector has tapped each rivet head, but because long experience has shown that riveting in the hands of an honest organization makes dependable joints.

Only a similar experience with competitive processes will yield a similar confidence, and eventually prove the soundness of welded joints. The customers of the first four gentlemen quoted are part of this growing body of opinion.

Should Furnaces Run on Sunday?

(Concluded from page 1432)

fine. But we never could get a bed of iron until Monday evening; after that, we let out a bed every morning and evening. I noticed, however, that we did not make as much iron in the fore part of the week—say the three first days—as the three last. This undoubtedly was owing to the ore being reduced on Saturday, so as to have the furnace in good order for stopping. This was done to prevent the furnace from cooling off as fast as it would have done had the burthen or ore all been left on. In this case we no doubt would have had a great deal of trouble in starting, and perhaps not have been able to get the furnace cleared at all; for in all my experience with furnaces it was running a considerable risk to stop any length of time with a full burthen. I feel satisfied, had we not stopped on Sundays, the furnace would have made 4 tons of metal with the same hands and nearly the same amount of stock, instead of about 3 per day.

The next year, say '48, the furnace did not do so well. This I thought was owing entirely to the ore, as it had to be got farther in the hill, and underwent a change for the worse. It was much harder to smelt and did not yield as it had done. We tried stopping several Sundays in '48, but found that it did not do anything like so well as when we stopped in the summer of '47. I am therefore clearly of the opinion that it depends upon a great many circumstances, as to the practicability of stopping furnaces over the Sabbath.

Your Brother,

SAMUEL DUNCAN.

How Procedure Control Welding Originated

(Concluded from page 1434)

ments. It was obvious that this program would require a careful analysis of all of the features involved, including the training and supervision of the welding operators, the selection of material to be welded and the welding rod used, the design of the joint for welding, the proper preparation of the parts for welding, the proper technic for actually making the welded joint, and adequate provision for testing the finished job.

Men in the petroleum industry had an adequate appreciation of these essentials; consequently in 1924 members

BEWILDERMENT over the spectacular jumps which every day's stock market records has extended even to men described as "among Wall Street's shrewdest operators." One such observed the other day that without doubt we are going through a process of inflation, adding with due circumspection: "I still cling to the belief that one and one make two." Such an expression might classify its author as of an outgrown era, but it is about the only type of judgment that may safely be passed upon the amazing developments of these six-million-share days. As the wonder grows, the question keeps recurring whether the minds that seemingly control the situation have grasped something which others have missed, though equally intent on knowing all that is to be known. Or is it the Florida boom over again on a more stupendous scale and with no less certain a reckoning ahead, even though the credit supply suffice for further increases in brokers' loans and the reaction when it does come be without a sudden smash?

of the engineering and service staff of the Linde Air Products Co. were asked to cooperate in the laying of a long overland pipe line in eastern Texas. Welding crews for this line were organized and trained and the line put in in record-breaking time. Out of the 60,000 or more welded joints required to lay 220 miles of 16, 18 and 20-in. pipe in 20-ft. lengths, only four or five proved defective under test and these were promptly rewelded.

At the completion of this job all our men who were in contact with it pooled their experiences and out of this fund of information came a schedule of practices covering the six steps previously mentioned. This outline of good practice for pipe laying seemed to furnish a set of specifications whereby similar work could be done on other lines, and were designated a "procedure control" for pipe line welding. This procedure control was used and proved highly successful on other installations of similar character, now totaling several thousand miles.

It was obvious from the first that the principles of procedure control could be applied to other applications of welding—in fact, that they are a set of basic principles upon which any welding application might be conducted. And in practice over several years this has proved correct. Procedure control welding has been applied with outstanding success to the production of pressure vessels, light sheet metal products, the reclamation of steel and gray iron castings, bronze-welding of cast iron pipe, and many other major applications of the oxy-acetylene process.

Procedure control for oxwelding considers the following essentials:

- A. Determining the ability and knowledge of the welding operators.
- B. Selection of material to be welded.
- C. Design of the joint for welding.
- D. Proper preparation of the parts
- E. Welding technic.
- F. Testing of the welded product.

When these elements are properly provided for, the oxy-acetylene process can be depended upon to furnish a dependable and safe construction for practically any type of metal structure. By understanding and applying these fundamentals the outstanding advantages in flexibility, quality and cost of the oxy-acetylene process for joining metal sections can be obtained. This procedure control idea, while representing an outstanding development in the managerial aspects of welding, is not new, but is simply the application of accepted good practice for engineering design and construction to work done by the oxy-acetylene process.

Iron Output Increased in November

Daily Rate Gained 1252 Tons or 1.15 Per Cent Over October—
Largest November Since 1918—Net Loss of Three Furnaces

PIG iron production in November, according to actual returns received from all companies, showed an increase of a little over 1 per cent over October. It was also the largest for this year and exceeded all records for that month since November, 1918.

Total November pig iron output was 3,302,523 gross tons, or 110,084 tons per day for the 30 days, as against 3,373,506 tons, or 108,832 tons per day, for the 31 days in October. This is an increase for November of 1252 tons per day, or 1.15 per cent. In October the increase over September was 6755 tons per day, or 6.6 per cent. The November rate was the

largest this year and compares with 88,279 tons per day in November last year. It was also the largest in 19 months, or since April, 1927, when the daily rate was 114,074 tons. The rate last month was also the largest for November since 1918, when the daily rate was 111,802 tons. There have been but two November daily rates exceeding that of this year—in 1918 and in 1916. In 1916 the rate was 110,394 tons per day.

Operating Rate Active on Dec. 1

There were 194 furnaces active on Dec. 1, having an estimated operating rate of 108,575 tons per day. This

compares with 108,800 tons per day as the operating rate for the 197 furnaces active on Nov. 1. Last month three furnaces were blown in and six were shut down. Several large furnaces were operated at a high rate in November, which accounts in part for the high operating rate of the 194 furnaces on Dec. 1 as compared with the 197 on Nov. 1.

Of the three furnaces blown in during November, one was a Steel Corporation stack, one belonged to an independent steel company and one was a merchant stack. The six furnaces shut down included three Steel Corporation stacks, two inde-

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in November Was 1.15 Per Cent More Than in October; Composite Prices Increased
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

pendent steel company furnaces and one merchant unit. The net loss of three furnaces for the month was in steel making stacks.

Steel and Merchant Iron

There was a gain in steel-making iron last month of 423 tons per day—the November daily rate was 88,474 tons, as compared with 88,051 tons per day in October. Merchant iron output made a larger gain last month, or 829 tons per day. The November rate was 21,610 tons per day and that in October was 20,781 tons per day.

Furnaces Blown In and Out

During November the following

furnaces were blown in: One Cambria furnace of the Bethlehem Steel Co. in western Pennsylvania; one Toledo stack of Pickands, Mather & Co. in northern Ohio; and one Bessemer furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama.

The following furnaces were blown out or banked last month: One stack of the Donner Steel Co., Inc., in the Buffalo district; the Sheridan stack of the Lavino Furnace Co. in the Lebanon Valley; one Carrie and one Duquesne stack of the Carnegie Steel Co. and one Eliza furnace of the Jones & Laughlin Steel Corporation in the Pittsburgh district, and one Lorain furnace of the National Tube Co. in northern Ohio.

Magnesia and Silica Crucibles Made in Induction Furnace

The production of silica and magnesia crucibles in the induction furnace has been achieved in the laboratory of the Pacific experiment station of the United States Bureau of Mines, Berkeley, Cal. The essential new parts of this work are the development of a technique for the high-frequency furnace production of silica crucibles of greater wall thickness than could be readily fabricated from commercial fused silica, and for heavy-walled magnesia crucibles of great density and mechanical strength. A description of the method employed, which produced crucibles of excellent quality in a reasonable time and with a moderate expenditure of power and materials, is given in Serial 2896, by C. N. Schuette, recently published by the bureau.

The Foote Brothers Gear & Machine Co., Chicago, is offering its common stockholders the privilege of purchasing additional stock at \$20 a share, in order to finance purchase of the Lyle Culvert & Road Equipment Co., the Stockland Road Machinery Co., and the Northwestern Steel & Iron Corporation, all of Minneapolis, and the Bates Mfg. Co., Joliet, Ill.

Iron and Steel Markets

Pig Iron Output at a High Rate

November Daily Production Largest Since April, 1927—

Steel Operations Steady Despite Effect of
Year-End Stock Reducing

PIG iron production last month, at 110,084 tons per day, was the highest since April, 1927, and was the largest November output since 1918. With December estimated, the total for the year will be close to 38,000,000 tons, which has been exceeded only in two years since the war, 1923 and 1926.

Steel production holds to a range of 80 to 83 per cent, notwithstanding some falling off in specifications from consumers who desire to keep their stocks at a minimum over the inventory period. The automobile industry, although demanding less steel for December shipment, owing to changes in models and to stock reduction over the year end, has arranged for large shipments early in the new year.

Except for the automobile industry, most of the major consuming lines are taking practically as much steel as at any time in months, and in a few lines, notably railroads and shipbuilding, the outlook is promising for an upward swing.

Rail orders of 42,000 tons placed at Chicago included 28,000 tons for the Chicago & North Western and 10,000 tons for the Wabash, while four roads will take a total of 25,000 tons of track accessories, with 20,000 tons about to be closed. The Santa Fe inquired for 3400 freight cars, in addition to 1075 mentioned a week ago, and is also in the market for 56 passenger cars, requiring in all 70,000 tons of steel.

American shipbuilding, long quiescent, is being stimulated by the loan provisions of the Merchant Marine Act. A Chester, Pa., shipbuilder has ordered 8600 tons of plates and shapes for an ocean liner, and a Camden, N. J., yard is seeking protection on 60,000 tons of plates and 15,000 tons of shapes for six ships on which it is bidding. Bids have been taken on two large Lake cargo vessels. A Wilmington, Del., shipyard bought 1500 tons of plates for three yachts.

The construction field continues to hold attention because of the volume of pending tonnage, which was augmented in the week by 27,400 tons, of which 10,000 tons is for a Chicago office building. Awards were 42,400 tons. A sheet steel piling contract of unusual size was for 4000 tons for a railroad warehouse in Jersey City.

Specifications from the agricultural-machinery industry in November were the largest on record, and the volume of shipments is undiminished.

Such loss as may occur this month in the production of some lines of finished steel will be partly offset by increasing operations of rail mills, which are about to begin rolling of recent orders, and of tin plate mills, which are up to 85 per cent of capacity operations against a recent dip to about 75 per cent.

Although first-quarter steel contracting has not yet gathered momentum, the situation as to prices of plates, shapes and bars has been clarified by the announcements of most of the producers that no advance will be made from the range of 1.90c. to 2c., Pittsburgh, prevailing on contracts and spot orders in this quarter. Chicago mills have withheld decision on forward prices for these products, but outside competitors have sold at the current quotations. With no price advance to stimulate specifications, the mid-December deadline for completing fourth-quarter contracts may not be as effective in driving in tonnage as it was in September.

Some users of sheets, desiring to delay current quarter shipments until after Jan. 1, have been told that tonnages not released for movement this month will be invoiced at the \$2 advance which is in effect on first-quarter contracts.

A reduction of \$5 a ton has been made on cold-drawn alloy steel bars through a change from 1c. to $\frac{3}{4}$ c. per lb. in the extra over the price of hot-rolled alloy bars.

November pig iron production was 3,302,523 tons, only 70,983 tons below the total for October, which had one more day. On Dec. 1, 194 furnaces were in blast, making iron at a daily rate of 108,575 tons, against 197, on Nov. 1, operating at a daily rate of 108,800 tons. Three Steel Corporation, two independent steel company and one merchant stacks went out of blast during the month, and one Steel Corporation, one independent and one merchant furnaces went in, a net loss of three.

Pig iron sales have declined in some sections, but prices are steady. The 50c. a ton advance made a week ago by one Alabama producer may be followed by others. Eastern Pennsylvania basic and Virginia foundry iron have been marked up 50c.

Water shipments of 53,980,874 gross tons of Lake Superior ore in the season just closed were 3,000,000 tons more than in 1927 and were exceeded in only four of the past 10 years.

The Ruhr lockout has ended with recourse again to governmental arbitration, and European steel sellers are now actively seeking orders.

A sale of 5000 tons of steel ties has been made in England to a British railroad, the first contract of the kind.

THE IRON AGE composite prices are unchanged at \$18.59 for pig iron, its high of the year, and at 2.362c. per lb. for finished steel. A year ago pig iron was \$17.59 and finished steel 2.307c.

Pittsburgh

Output Maintained By Active Specifying—Price Stability Gives No Incentive for First-Quarter Buying

PITTSBURGH, Dec. 4.—December opens without material change in the rate of steel ingot output in this and nearby districts, but the explanation is less in the volume of new business than in the fact that consumers still are specifying with a fair degree of freedom against old commitments. Such losses of tonnage as there have been in some steel products are pretty well counterbalanced by the swell in the production of rails and tin plate.

Consumers seemingly have few requirements beyond those that cannot be met from existing contracts; fresh purchases also reflect a desire to keep the materials item in year-end inventories at a minimum. First-quarter buying has not yet developed much momentum. Since prices of bars, plates and shapes are to be the same as those in this quarter's contracts, buyers evidently do not sense the necessity of haste.

The stipulation as a deadline date on fourth quarter contract specifications cannot be enforced under the circumstances and this is another reason for the lack of real activity.

Not a few users of sheets do not want shipments made this month in

the fear that they may not be worked off before the inventory date. Mills are insisting on specifications by Dec. 10 under the threat of an advance of \$2 a ton if tonnages are not released for shipment this month. The higher prices named several weeks ago still refer more to January and later shipment than to current deliveries.

Much of the first quarter strip requirements of the motor car builders remains to be placed.

Nothing yet has been said as to first-quarter wire and nail prices, but the idea will not down that producers will seek more money, but an advance of \$2 a ton, as has been suggested, will not, it is believed, include woven wire fence and wire rods.

Structural steel lettings remain very small in this district and fabricators are beginning to express some fear of inability to maintain shop operations throughout the winter unless there is early betterment in business. Railroad buying apart from track supplies has not assumed proportions calculated to elate local steel makers. The oil and gas industry is providing a fair amount of tonnage, and the hope is that it will do much better in 1929 than in recent years. Prospects for tin plate are regarded as very bright because of a belief that this year's pack will prove none too large for needs. The motor car industry is less anxious for steel and probably will not again show real desire for supplies until after the national automobile shows have been concluded next month.

Inactivity characterizes the primary materials markets. If anything, pig iron is a shade easier than it has been and in scrap there is a little more anxiety on the part of dealers for orders than there is on the part of consumers to place them.

Pig Iron.—The Westinghouse Electric & Mfg. Co. has asked for prices on its requirements of foundry and Bessemer iron for the first half of

next year; no specific tonnage is mentioned. Interest in the market on the part of melters in this district is very limited otherwise, and sales for the most part are of single carloads. On such lots of foundry iron, no particular difficulty is had in obtaining \$18, Valley furnace, for No. 2 grade, but the market remains untested on sizable tonnages. No big inquiries lately have developed for basic iron. Supplies of this grade have increased in the past three or four weeks and, while some producers are still quoting \$18, offerings of \$17.50 are uncovered. Incidentally, this is as high as any clear cut, openly competitive business has been done. That price also is well above the average of orders now on the books of merchant furnace companies. A price of \$18.25 for Bessemer and malleable iron is supported entirely by small lot sales. There is some evidence that Ohio and Indiana foundries, which lately have been drawing upon Valley furnaces for supplies, have become well covered on their immediate requirements. This fact, in conjunction with the lower rate of steel ingot production and the incident change in the position of steel companies with respect to surplus iron supplies, gives the general market an easier tone. The Jones & Laughlin Steel Corporation has taken off one of its Aliquippa furnaces for relining.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50
Bessemer	\$18.25 to 18.50
Gray forge	17.50
No. 2 foundry.....	18.00
No. 3 foundry.....	17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Billets, slabs and sheet bars reflect in specifications no material letdown in the operation of sheet, tin plate and strip mills. But new business is very dull, and active negotiations for first quarter tonnages are yet to be begun. Non-integrated sheet makers probably are waiting to see how well the advance in first quarter sheet prices goes over before entering orders for sheet bars at an advance of \$1 a ton over this quarter's contract price. Strip makers

appear assured of some advance over the prices they have received in the past six months, while the billet and slab prices for the first quarter are the same as in this quarter, but \$1 a ton above the third quarter price. The next quarter's price on wire rods is yet to be announced, but the common belief is that it will remain at \$42, base Pittsburgh or Cleveland.

Bars, Plates and Shapes.—Without the formality of public announcements, makers are empowering their salesmen to take first quarter contracts at the prices in effect on fourth quarter commitments. Business is fairly active in specifications, but suffers somewhat from the fact that consumers are desirous of having light stocks at the end of the year, and since there is to be no advance in prices for first quarter, the deadline date on this quarter's contract specifications is rather ineffective as a business stimulant. Structural lettings in this area run chiefly to small tonnages and no sizable projects are in sight. Local shops are busy, but need more orders to carry through the winter at an economical rate of operation.

Rails and Track Supplies.—Distribution of the New York Central track accessories orders is yet to be announced, but local producers expect to share to the usual extent, since there was little or no variation in the prices submitted by the various factors. In general, track fastenings are slow. The local standard-section rail maker has a good backlog of 1929 orders and rolling on them will be under way in the next 10 days. Light-section rails are very dull.

Wire Products.—No announcements have been made as to first quarter prices; in view of the tardiness of word on the matter, there is a belief in some quarters that no change is to be made, but some manufacturers intimate that prices soon to be announced will be \$2 a ton higher on nails and wire. Business reflects the desire of distributors and consumers to keep down inventories, but runs well up to the average for this time of the year.

Tubular Goods.—Business is fairly active. Makers are better supplied with line pipe orders than with oil country or building construction requirements, but there is some demand for all three classes. Among the projected pipe lines, the one to convey natural gas from Wyoming to Salt Lake City, calling for 350 miles of 14-in., 16-in. and 18-in. pipe, is regarded as nearest the mills.

Sheets.—November proved one of the big months of the year in specifications and will not fall far short of being equally good in shipments. There is now some slowing up in tonnage releases, owing to the desire of consumers to be able to show heavy cash and light materials items in their year-end financial statements. The mills are meeting this situation by applying the clause in contracts which sets up Dec. 10 as the date of final specifications. Attempts by consumers to defer shipments until next month find manufacturers willing if the buyers are prepared to pay the January price, which is \$2 a ton higher than that on December shipments. Generally, the mills are driving for specifications, but expect to time shipments in a way that will help buyers to escape heavy stocks on the last day of the year. Producers say that the higher prices announced several weeks ago now are effective, but it is also a fact that most consumers have lower priced contracts that run somewhat to the blanket variety, against which they can specify for any additional early requirements that may develop.

Tin Plate.—Mill operations continue to increase and now average fully 85 per cent of capacity. Early 1929 requirements have been specified rather freely since the announcement on Nov. 15 of the first half price. Sentiment is cheerful as to next year food container requirements. This year's pack of peas, corn and tomatoes is estimated to be below what has come to be regarded as the annual consumptive requirements, and a close clearance of the year's general food pack is looked for before the new crops come in. This condition points

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	7
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel	Charcoal Iron
2 to 2½ in.....	27 1½ in.+18

Less carload, 4 points less. Add \$8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

Per Cent Off List

Carbon, 0.10% to 0.30%, base (carloads).....	55
Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

to active packing operations next year, especially as the use of canned foods is gaining from year to year.

Cold-Finished Steel Bars and Shafting.—Since prices are not to be different in the next quarter, the recent opening of books for that period has not been followed by a rush of contracting. Business in the past week showed some gain as compared with the week before, but it is recognized that it will not be until after next month's automobile shows that a clear line will be had on the demand or that there will be real constancy to automobile production.

Hot-Rolled Strips.—The market is clearly quotable at 1.80c. to 1.90c., base Pittsburgh, for strips wider than 6 in. and 1.90c. to 2c., base, for 6 in. and narrower, but with the lower figures the prevailing ones. Prices of 1.80c. and 1.90c., which were supposed to have been reserved for the round tonnage buyers, have been named to some relatively small tonnage users. It seems several of the really large tonnage buyers have not yet spoken for their first-quarter requirements and the market thus has not had the test of important business. Current movement of strips on old orders is holding up well, but new business as a whole is quiet.

Cold-Rolled Strip.—Makers have not encountered much resistance on first-quarter contracts to a price of 2.85c., base Pittsburgh, but small lot buyers are voicing objections to more than that and the really large consumers have yet to do much contracting. There is a fairly well sustained movement on old orders, but order books of makers are growing slimmer.

Coke and Coal.—No further recession has occurred in coke prices, but the market is no more active than it has been, and while supplies are moderate, gaged by ordinary standards, they are quite ample for all requirements. The coal market could hardly

be duller than it is, and the concern of producers seems to be greater about keeping their mines going than in the prices they can secure.

Old Material.—Heavy breakable cast scrap has been sold at \$13 in the past week, but except for this change, a decline of 50c. a ton, prices are stationary for the second consecutive week. Heavy melting steel still is appraised at \$17, sales into consumption at more not being possible, while dealers find it difficult to uncover supplies at less. Steel manufacturers do not find it necessary to supplement deliveries on contracts by fresh purchases, but, on the other hand, the scantiness of supplies makes dealers wary about selling. These circumstances obviate the possibility of much fluctuation in prices. The Pennsylvania Railroad December scrap list, closing Dec. 5, contains almost 50,000 net tons, including 7000 tons in a supplementary list.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....		\$17.00
Scrap rails.....		17.00
Compressed sheet steel....		17.00
Bundled sheets, sides and ends.....	\$15.50 to	16.00
Cast iron carwheels.....	15.00 to	15.50
Sheet bar crops, ordinary..	17.00 to	17.50
Heavy breakable cast.....	13.00 to	13.50
No. 2 railroad wrought...		17.00
Hvy. steel axle turnings...		15.00
Machine shop turnings....	10.50 to	11.00
Acid Open-Hearth Grades:		
Railr. knuckles and couplers	18.50 to	19.00
Railr. coil and leaf springs	18.50 to	19.00
Rolled steel wheels.....	18.50 to	19.00
Low phos. billet and bloom ends.....	20.50 to	21.00
Low phos., mill plates....	19.00 to	19.50
Low phos., light grade....	18.00 to	18.50
Low phos., sheet bar crops	19.00 to	19.50
Heavy steel axle turnings.		15.00

Electric Furnace Grades:		
Low phos. punchings.....	18.50 to	19.00
Hvy. steel axle turnings..		15.00

Blast Furnace Grades:		
Short shoveling steel turnings.....	12.00 to	12.50
Short mixed borings and turnings.....	12.00 to	12.50
Cast iron borings.....	12.00 to	12.50
No. 2 busheling.....	9.50 to	10.00

Rolling Mill Grades:		
Steel car axles.....	20.00 to	21.00
No. 1 railroad wrought...	13.00 to	13.50
Sheet bar crops.....	18.00 to	18.50

Cupola Grades:		
No. 1 cast.....	14.50 to	15.00
Rails 3 ft. and under.....	17.50 to	18.00

The Sheet Steel Trade Extension Committee, Terminal Tower Building, Cleveland, is undertaking an extensive campaign to promote the wider use of sheet steel in various fields. The economy, durability and fire-resistiveness of sheet steel will be presented to fabricators, sheet metal contractors and the consuming public through various advertising media.

Textile machinery and parts valued at \$100,922,791 were produced in 1927, according to the Bureau of the Census. Other products and receipts for repair work and contract work were valued at \$16,095,538, making a total of \$117,018,330, a decrease of 3.8 per cent, as compared with \$121,653,324 for 1925, the last preceding census year.

Plans Being Pushed for Western Metal Congress

Fourteen metal engineering societies were represented at a preliminary meeting held recently at Los Angeles to make plans for the Western Metal Congress to be held Jan. 14 to 18 at the Biltmore Hotel and the Shrine Civic Auditorium in that city. More than 80 per cent of the display space for the metal and machinery exposition has been subscribed for and the program for the convention sessions is rapidly taking shape. Several of the organizations plan to hold their regular annual meetings during the convention and a special train for Eastern delegates will be run from Chicago over the Atchison, Topeka & Santa Fe Railroad.

The following societies will take part: American Society of Mechanical Engineers, American Institute of Mining and Metallurgical Engineers, California division of the American Petroleum Institute, Institute of Metals, American Welding Society, Society of Automotive Engineers, Pacific Coast Electrical Association, Pacific Coast Gas Association, Institute of Marine Engineers, Metal Trades and Manufacturing Association, Chamber of Mines and Oils, National Association of Purchasing Agents, American Foundrymen's Association and American Society for Steel Treating.

W. H. Eiseman, now at the Shrine Civic Auditorium, Los Angeles, is in general charge.

Graham-Paige to Assemble Automobiles in Germany

The Graham-Paige Motors Corporation, Detroit, has acquired a plant of 57,000 sq. ft. of floor space at Johannisthal, Germany, a suburb of Berlin, where Graham-Paige cars will be assembled in the future for distribution in Germany. The German plant of the E. W. Budd Mfg. Co., American body builder, is also located in Johannisthal, as are several other American automotive plants.

All employees of Deere & Co., Moline, Ill., who have been with the company two years or more, will be given an annual vacation of two weeks with pay, according to a recent announcement of William Butterworth, chairman of the board. The order affects about 7000 factory employees, and vacation wages will be governed by the normal wage and length of service of employee.

A 36-in. blooming mill for the Messina, N. Y., plant of the Aluminum Co. of America will be built by the Mesta Machine Co., Pittsburgh, and the order for a 24-in. structural mill for this plant has gone to the Mackintosh-Hemphill Co., Pittsburgh. The Aluminum company is building a plant at Messina for rolling aluminum into structural shapes for railroad cars.

Chicago

Rail Orders Total 42,000 Tons—Inquiry for 3500 Cars— November One of the Best Months of Year

CHICAGO, Dec. 4.—The Chicago iron and steel market can best be characterized as steady, with little evidence of other than moderate changes in the near future. Prices for finished steel for delivery after the turn of the year are holding the attention of many buyers, as indicated by an expanded volume of inquiry. Local producers are noncommittal, but mills in the East which market in this territory have not hesitated to accept future business at 2c. to 2.10c. per lb. for plates, shapes and bars. New orders for rails bulk large, but output remains low, pending releases against 1929 contracts. In some quarters it is thought heavier rollings will be under way by Dec. 15.

Railroads are active in making known their spring needs of track accessories. The Santa Fe has added 3500 freight cars and 50 passenger train cars to its inquiries of a week ago.

Announcement is made today that a local bond house will underwrite an issue for the 1 North La Salle office building, Chicago. Preliminary estimates place the steel requirements at 10,000 tons. The construction field still holds attention because of the volume of pending tonnage; actual awards are few in number and of moderate size.

November sales of finished steel products made it one of the best months in the year; total business was fully 10 per cent heavier than in November, 1927. Shipments in November far outdistanced the volume sent from mills in the same month last year. Sales for the past week were the best in five weeks and specifications also were the largest, with one exception, in four weeks.

Pig Iron.—Prices for Northern pig iron in and near Chicago remain firm at \$20 a ton, local furnace. Concessions on boat iron and lower quotations in meeting competition to the East seemingly have had no effect on the local situation. Shipments are steady, but producers expect a drop by Dec. 20, when foundries will slow down for the inventory period and the holiday season. Indications are that shipments in 1928 will at least equal those of the record year of 1926. One producer has advanced the price of Southern iron 50c. a ton, bringing the new quotation to \$17, Birmingham, or \$23.01, delivered Chicago. The silvery market is quiet, following an active contracting period.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.....	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail) ..	\$22.51 to 23.01
Low phos., sil. 1 to 2, copper free..	29.50
Silvery, sil. 8 per cent....	\$30.79 to 31.79
Bess. ferrosilicon, 14-15 per cent...	47.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—The Santa Fe has added 3400 freight cars and 50 passenger train cars to its inquiry of last week for 1075 freight cars and 16 baggage cars. The totals now are 4475 freight cars and 56 passenger cars. The steel for these cars will total about 70,000

tons. Local mills compute that 6100 freight cars were purchased by United States railroads in November. New orders for oil storage tanks will take more than 2000 tons of plates, and fresh inquiry from producers of petroleum products in Texas totals 3600 tons. Car shops are beginning to specify against recent orders, but the bulk of plate tonnage being shipped from local mills is going to structural shops and builders of large tanks. Chicago plate mills are engaged at about 80 per cent of capacity.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Ferroalloys.—Shipments of these commodities are in good volume. The spiegeleisen market is quiet. Carloads are being offered at \$34 a ton, Hazard, Pa. Several small orders for ferromanganese have been taken at \$105 a ton, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Billets.—Sales for delivery over the remainder of this year total 25,000 tons. Specifications are well up to the average of recent weeks.

Cast Iron Pipe.—The cast iron pipe market is stimulated by an inquiry from Detroit for 6000 tons of 24, 36 and 48-in. pipe. In some quarters this request for prices is looked upon as the forerunner of a winter buying movement and as a feeler to determine whether winter manufacturing prices will be obtainable. Although this subject has been given some consideration by sellers, no public announcement has been made as to the course to be taken. Quotations for 6 in. and larger diameter pipe are steady at \$37 to \$38 a ton, Birmingham. The freight rate to Chicago is \$8.20 a ton. Contractors in and around Chicago are placing small tonnages. Several public utilities have asked for preliminary figures for use in estimating budgets for the coming year. Railroads are finding little use for cast iron pipe at this time of the year.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$45.20 to \$46.20; 4-in., \$49.20 to \$50.20; Class A and gas pipe, \$4 extra.

Bars.—Shipments of bar mill products to manufacturers of automobiles are not greater than in late Novem-

ber, but builders are looking forward to an active demand for their products soon after the turn of the year. Shipping schedules now arranged for late December and early January are large. Specifications from the agricultural machinery trade in November were the heaviest on record, and the rate of shipping is undiminished. Deliveries on mild steel bars range from four to five weeks. Spot sales of iron bars are numerous at current quotations. Contracting in alloy steel bars is making headway. Shipments to most consumers are lighter as users attempt to hold stocks to the minimum. Forward contracting in rail steel bars is not being pushed by producers, but when tonnages are offered for delivery in the first quarter the price named is 1.95c. per lb., Chicago Heights. Specifications are in larger volume than shipments and deliveries have been extended. Both Chicago Heights mills continue to operate on double turn.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Structural Material.—Structural steel awards in the week totaled 1900 tons and fresh inquiry amounts to 3000 tons. Preliminary figures are being taken on a building to be erected at 1 North La Salle Street, Chicago; it is reported that 10,000 tons of steel will be needed.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Rails and Track Supplies.—Sales of standard-section rails total 42,000 tons. Included in this figure are 28,000 tons for the Chicago & North Western, 10,000 tons for the Wabash and 4000 tons for the Missouri-Kansas-Texas. Inquiry is slow, although several sizable orders are in the making. Four Western railroads have closed for 25,000 tons of track accessories for delivery in 1929. Fresh inquiry totals about 20,000 tons. In the local market prices for tie plates are steady at \$43 a ton. Inquiry before the trade for iron tie plates reaches a total of 10,000 tons. Standard-section rail production in this district is being held to a low rate, but rolling schedules against 1929 contracts are expected to be put in effect about Dec. 15.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—Buyers are being offered first quarter contracts at prices which prevailed in the fourth quarter. Current specifications are lighter, but operations are being held at an unchanged rate, so that producers may expand stocks.

Sheets.—Forward contracting is moving slowly. There is still a large tonnage to be specified against fourth quarter contracts. Spot purchases, except by consumers who do not normally contract, are negligible. Current specifications are a trifle heavier, and mills are operating at a higher rate, the range now being between 75

and 80 per cent of capacity. The roofing trade remains quiet. Jobbers are moving sizable tonnages from stock. Demand from agricultural implement manufacturers is turning upward. Deliveries are improving, common finishes now being obtainable in 10 days.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c. to 3.00c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Reinforcing Bars.—Local dealers in billet steel reinforcing bars have named 2.35c. per lb. as the minimum on carlot orders and producers are asking 2c. to 2.10c. per lb. for carloads in mill lengths of 40, 50 and 60 ft. Lower quotations by dealers are not to be withdrawn for several weeks. New prices for rail steel reinforcing bars are 2.05c., Chicago Heights, to the general trade and producers are asking 1.95c. for carload orders in mill lengths. Rolling schedules at billet bar mills are arranged unsatisfactorily for bending shop needs. With bar fabricators operating at only 50 per cent of capacity, deliveries from mills are such that some construction programs cannot be held to schedule. Contracts are few in number, but inquiry is active and estimating bureaus are busy.

Old Material.—The movement of heavy melting steel to local mills is steady as dealers press to cover old contracts taken at \$15 a gross ton, delivered. Consumer purchases of this grade are lacking, but dealers, who are looking for steady if not higher prices after the turn of the year, are anxious to complete old obligations and they do not hesitate to trade at the prices named in recent heavy tonnage contracts. The supply of cast iron borings is ample to meet current needs of consumers. Shipments are materially lighter from automobile manufacturers. The embargo against shipments recently put in effect by merchant furnaces has been lifted and borings are again moving freely to those consumers. For this grade dealers are paying \$12 to \$12.25 a ton, delivered, against old contracts. De-

mand for railroad malleable is active at \$16.50 a gross ton for local delivery, but 50c. above this price is obtainable for prompt shipment to outlying points. A melter has closed for 1000 tons of stove plate at \$12.75 a net ton, delivered, which is an advance of 25c. a ton in the week. Plate scrap is scarce and little relief is looked for by the trade until February or March, when it is expected that railroad car shops will be in heavier production. The demand for short rails, 2 ft. and under, is insistent. This specification is more to the liking of users than the older 3 ft. and under lengths. The Chicago & North Western will close a list this week.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraulic, compressed sheets	13.00 to 13.50
Drop forge flashings.....	10.50 to 11.00
Forg'd, cast and r'l'd steel carwheels	17.75 to 18.25
Railr'd tires, charg. box size	17.50 to 18.00
Railr'd leaf spring cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs.....	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings.....	14.25 to 14.75
Low phos. punchings.....	16.50 to 17.00
Low phos. plate, 12 in. and under	16.00 to 16.50
Blast Furnace Grades:	
Axle turnings.....	12.00 to 12.50
Cast iron borings.....	11.75 to 12.25
Short shoveling turnings..	11.75 to 12.25
Machine shop turnings....	8.00 to 8.50
Rolling Mill Grades:	
Iron rails	15.00 to 15.50
Re-rolling rails	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.25 to 17.75
Steel rails less than 2 ft..	19.00 to 19.50
Angle bars, steel.....	16.50 to 17.00
Cast iron carwheels.....	14.25 to 14.75
Malleable Grades:	
Railroad	16.50 to 17.00
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms	20.50 to 21.00
Iron car axles.....	26.50 to 27.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought...	13.25 to 13.75
No. 2 railroad wrought...	13.00 to 13.50
No. 1 busheling.....	11.50 to 12.00
No. 2 busheling.....	6.00 to 6.50
Locomotive tires, smooth..	13.25 to 13.75
Pipes and flues.....	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast....	15.50 to 16.00
No. 1 railroad cast.....	15.00 to 15.50
No. 1 agricultural cast....	14.50 to 15.00
Stove plate	12.25 to 12.75
Grate bars.....	12.50 to 13.00
Brake shoes.....	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—Improvement noted a week ago in sales of woven wire fencing is sustained, but the tonnages on the books of producers are far below those usual this late in the fall. Specifications for this commodity are more liberal from the South and Southwest, where weather conditions

are favorable for outdoor work. Demand for nails is light, sustaining output of not more than 30 per cent of capacity; the total tonnage so far this year is far below the volume of orders taken in 1927. The display of new automobile models is resulting in larger demands from several car manufacturers in the Detroit district, and accessory makers in and around Cleveland are also taking larger quantities of wire. The jobbing trade is well sustained in parts of the country where severe weather has not been experienced. Distributors generally are holding stocks to a minimum and are ordering extremely close to actual requirements. Inquiry for first quarter is more active, but producers are holding back the opening of books for that period.

Coke.—Forward contracting for the first half of 1929 is active. Deliveries remain on a par with those of a week ago.

Shipments of Sheet-Metal Ware Increase

WASHINGTON, Dec. 4.—Shipments of galvanized sheet-metal ware in October included 206,854 dozens, valued at \$832,243, as compared with 189,789 dozens, valued at \$742,188 in September and 182,469 dozens, valued at \$724,692 in October, 1927, according to reports received by the Department of Commerce from 15 concerns comprising a large proportion of the industry.

October shipments of enameled sheet-metal ware were 417,387 dozens, valued at \$1,650,657, as compared with 352,484 dozens, valued at \$1,372,242 in September and 322,081 dozens, valued at \$1,297,431, in October, 1927, according to reports received by the Department of Commerce from 18 manufacturers comprising approximately 80 per cent of the industry.

A continuous furnace for heating slab ingots is to be built at the plant of the Dominion Foundries & Steel, Ltd., Hamilton, Ont., by the Rust Engineering Co., Pittsburgh. The furnace will employ the Rust double firing principle in which a separately fired soaking chamber is utilized to equalize the temperature of the slab ingots before discharging. The furnace is approximately 60 ft. in length and 15 ft. in width, and will use coke oven gas as fuel.

An exposition of modern American industrial and decorative arts will take place in Chicago in January. It will embrace decorative work and include metalwork as well as lamps and lighting fixtures. Interiors will represent respectively a modern business office, a Pullman compartment, a passenger airplane interior, etc. James D. Cunningham, president Illinois Manufacturers' Association, is executive director of the exposition.

Philadelphia

No Price Change for First Quarter on Plates, Shapes and Bars—Shipbuilders Inquire for Large Tonnages

PHILADELPHIA, Dec. 4.—First quarter contracts on steel bars and plates will be closed at the current contract prices, instead of at an advance suggested by mills several weeks ago. Some small tonnages of bars are reported to have been closed at 1.95c., Pittsburgh, and plate mills are quoting 2.05c. to 2.10c., Coatesville, on contracts. Sheet mills are maintaining a firm attitude on prices, but consumers are not yet showing much interest in future buying. The opening of bids on 700 tons of black, galvanized and blue annealed sheets by the Pennsylvania Railroad brought out the current market prices at mill, except in the case of blue annealed sheets, on which one eastern Pennsylvania maker quoted 2c., mill, for delivery to Dec. 31, but 2.10c., mill, for first quarter.

Construction projects are less numerous, but shipbuilders are providing substantial prospective business in plates for work on which they are bidding. A Camden, N. J., yard has inquired for prices on about 60,000 tons of plates and about 15,000 tons of shapes for six ships, awards of which are pending.

Ferromanganese.—Most consumers have contracted for part or all of next year. The price is \$105 per ton, seaboard, quoted by domestic and foreign producers.

Pig Iron.—Orders for 25,000 tons of basic iron, reported last week as placed by an eastern Pennsylvania consumer, are understood to have been distributed among three producers. The tonnage was bought at a price quoted when the inquiry was issued about a month ago. Furnaces are now quoting on a basis of about \$20 per ton, furnace, or a 50c. a ton advance. Foundry iron is steady at \$21 per ton for first quarter; contracting is light. Activity by shipbuilders is beginning to develop some tonnage, and the Sun Shipbuilding & Dry Dock Co., Chester, Pa., is inquiring for about 500 tons of foundry grade. The Pusey & Jones Co., Wilmington, Del., is expected to inquire before the end of the year for a small tonnage. The Standard Steel Works Co., Burnham, Pa., is inquiring for 2500 to 3000 tons of low phosphorus. The Virginia pig iron producer has advanced its prices 50c. a ton, following an increase in the Birmingham market.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	21.26 to 21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X.	22.26 to 22.76
Basic (del'd east. Pa.)	20.25 to 20.75
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25	25.29
Va. No. 2X, 2.25 to 2.75 sil.	25.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Contracts for first quarter have been closed for small tonnages, and the prices to larger buyers are 1.90c. to 1.95c., Pittsburgh, or 2.22c. to 2.32c. per lb., delivered Philadelphia. A substantial tonnage of rein-

forcing bars will be required for the Reading Commercial Building, which was originally planned for structural steel, but is now designed for nine stories of reinforced concrete and three of structural.

Shapes.—Except on especially desirable business, 2.05c., f.o.b. nearest mill to consumer, is being quoted by eastern Pennsylvania mills. On a Pencoyd, Pa., basis this would be 2.11c., delivered Philadelphia. The successful bidder on a recent structural steel contract of 2700 tons used a price of 2c., mill, on the plain material, THE IRON AGE is informed, and a lower price on the shapes, mentioned in this column last week, appears to have been the basis of a bid by one of the unsuccessful contractors. Construction projects have declined recently and the tonnage in the Reading Commercial Building revised to call for part reinforced concrete construction has been reduced to about half the former total of 16,000 tons. A Camden shipbuilder, bidding for the contracts to build two Ward Line and four Matson Line ships, is seeking prices on about 15,000 tons of shapes. About 1600 tons of shapes for a ship contract has been placed by the Sun Shipbuilding & Dry Dock Co., Chester, Pa., with the Carnegie Steel Co.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ½-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex.	3.45c.
Cold-fin. steel, sq. and flats	3.95c.
Steel hoops	3.60c.
Steel bands, No. 12 to ½-in., inclus.	3.35c.
Spring steel	5.00c.
*Black sheets (No. 24)	4.00c.
†Galvanized sheets (No. 24)	4.75c.
Blue ann'l'd sheets (No. 10)	3.15c.
Diam. pat. floor plates—	
¼-in.	5.30c.
½-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Plates.—Protection is being given on substantial tonnages of plates required in pending shipbuilding contracts. The New York Shipbuilding Corporation, Camden, N. J., is inquiring for 12,000 tons of plates for two ships for the Ward Line and for 50,000 tons of plates for four Matson Line vessels. Although the Di Giorgio Fruit Co. is reported to have bought two or more ships in Europe, the present inquiry of that line for one or two ships to be built here has not been withdrawn. About 7000 tons of plates for an American South African Steamship Co. liner to be built by the Sun Shipbuilding & Dry Dock Co., Chester, Pa., has been awarded to the Carnegie Steel Co. The Pusey & Jones Co., Wilmington, Del., has awarded 1500 tons of plates and a small tonnage of shapes for three private yachts to the Bethlehem Steel Co. Plate prices continue at 2.05c. to 2.10c., Coatesville, or 2.15c. to 2.25c., Philadelphia.

Sheets.—Mills are maintaining 2.10c., Pittsburgh, on blue annealed; 2.85c., Pittsburgh, on black, and 3.60c., Pittsburgh, on galvanized sheets for first quarter delivery, but contracting has not developed to any extent. Bids on 700 tons of sheets for the Pennsylvania Railroad were at these prices, f.o.b. mill, except in the case of blue annealed sheets, on which one maker quoted 2c., Pittsburgh, for delivery to Dec. 31 and 2.10c. per lb. for the first quarter.

Imports.—In the week ended Dec. 1, 6700 tons of iron ore arrived at this port from Algeria and 152 tons of pig iron from Holland. Steel imports consisted of 65 tons of steel bars from Belgium and 36 tons of structural shapes and 10 tons of wire rods from Germany.

Old Material.—Except for a small tonnage of No. 1 heavy melting steel bought by a Claymont, Del., consumer at \$15 per ton, delivered, the iron and steel scrap market has been decidedly inactive.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.00 to \$16.00
Scrap T rails	14.50 to 15.00
No. 2 heavy melting steel	12.25 to 12.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.00 to 11.25
Heavy axle turnings (or equiv.)	12.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Roller steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	21.50 to 22.00
No. 1 forge fire	12.00 to 12.50
Cast iron carwheels	16.50
No. 1 cast	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling	16.50 to 17.00

Cleveland

Mills Announce Continuance of Fourth Quarter Prices of Plates, Shapes and Bars for First Quarter

CLEVELAND, Dec. 4.—Most of the leading producers have announced a continuation of the fourth quarter prices for first quarter contracts on steel bars, plates and shapes. This means a range of from 1.90c. to 2c., Pittsburgh, but producers expect to maintain a minimum of 1.95c. on most business. When Cleveland is used as a basing point for steel bars, the present range of 1.95c. to 2.05c., Cleveland, is continued by outside mills. Local bar mills expect to continue their 1.90c. mill base. While a few first quarter contracts have been written, mills are not pressing consumers for contracts. Specifications fell off the past week, particularly for steel bars, sheets and strip steel.

With the slowing down in production due to bringing out new models and the reduction of stocks for inventories, most of the automobile companies have curtailed their steel shipments for December, but the release of large tonnages is expected from this source for January shipment. One maker of low-priced cars has placed a large order for alloy steel bars for the first quarter. Some of the stamping plants in this territory have taken considerable automotive work against which they have not yet secured releases. This is causing a holding back of sheet specifications. Some of the mills can still take on a little tonnage in hot and cold-rolled strip steel for December shipment.

Plates are moving rather slowly. The American Shipbuilding Co. has taken ship repair work requiring 600 tons, which has been placed with a Pittsburgh district mill. The Pittsburgh Steamship Co. has taken bids on two large freight boats. Not much new work is developing in the building field.

Iron Ore.—The ore shipping season closed during the week with a total movement from the Lake Superior district of 53,980,874 gross tons, or about 3,000,000 tons more than during the previous year. This season's shipments were exceeded in only four of the past 10 years. Shipments in November were 4,260,942 tons, or more than double the November movement in 1927. Stocks at furnaces and at Lake Erie docks on Dec. 1 were approximately 39,500,000 tons, or 2,000,000 tons less than the amount at furnaces and docks on the same date a year ago. If the present rate of consumption is maintained, dock and furnace stocks on May 1 next year will be considerably less than on the corresponding date this year. However, consumers have secured shipments of all the ore that they expect to need before the opening of navigation, and while some stock piles may become well exhausted during the winter, a shortage is not looked for. The amount on docks and furnace yards May 1, this year, was 19,570,000 tons. Tabulation of shipments for November and for the season and for the past 10 years, as prepared by the Lake Superior Iron Ore Association, will be found in another column.

Pig Iron.—Sales declined the past

week, this evidently being partly due to the holiday. Cleveland interests during the week sold 32,000 tons in foundry and malleable grades, mostly for the first quarter. Few consumers are showing an interest in contracts beyond the first quarter. Inquiry is somewhat lighter. November shipments by some producers exceeded their production, and indications point to heavy shipments during December. While some of the automotive and stove and furnace foundries are curtailing operations this month and will take less pig iron, this decline in the demand will to some extent be offset by increased shipments to some of the other automotive foundries. Prices are firm and without change. One Valley furnace appears to have become rather active in parts of the Indiana territory, where it has made a few sales of foundry iron. An \$18 Valley price brings that grade to some Indiana points at a slightly lower price than the delivered price of Lake furnace iron. Cleveland furnaces are holding to \$18.50 for foundry and malleable iron for outside shipment and one Lake furnace to \$19.50 for its nearby territory. In Michigan, the market is firm at \$20.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	\$22.50 to 23.00
Malleable	19.50
Ohio silvery, 8 per cent.	29.00 to 30.00
Basic Valley furnace	17.50 to 18.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Ferroalloys.—Most consumers of spiegeleisen were covered by contracts before the recent \$1 a ton advance in prices. Some consumers have placed contracts for ferromanganese at \$105 a ton, and other business is pending.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.50c.
Galvanized sheets (No. 24)	4.45c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

Sheets.—Specifications have fallen off considerably, reflecting the slowing down of the automotive industry and the approach of inventory time. However, mills have received some good specifications, mostly for auto body sheets, for January shipment. Most mills have a good backlog to tide them over until next month. Some first quarter contracts are being placed, and there is a limited amount of early shipment business. Part of this is being taken at the new prices, but some of the mills that can take orders for December rolling are entering these at the old prices. Regular prices are firmly maintained for first quarter contracts.

Cold-Finished Steel Bars.—With the reestablishment of present prices on cold-finished steel bars for the first quarter, a \$5 a ton reduction has been made on cold-drawn alloy bars, this being effected by reducing from \$1 to 75c. per 100 lb. the differential over hot-rolled alloy bars. One producer made this reduction a few days ago and others decided to meet it. The reestablishment of the present cold-finished steel bar price is expected to result in considerable falling off in specifications this month, as consumers will reduce their stocks for inventories.

Reinforcing Bars.—New inquiry is limited to small lots. Both mill and warehouse prices continue irregular on new billet steel bars. Rail steel bars are unchanged at 1.90c., mill.

Semi-Finished Steel.—Specifications are holding close to recent volume. Not much contracting has as yet been done for the first quarter, for which a local producer is holding to \$34, mill, for sheet bars, billets and slabs.

Wire Products.—Manufacturers' wire continues in good demand, but nails are moving slowly. First quarter prices have not yet been named.

Warehouse Business.—This shows the seasonal slowing down in all commodities. Jobbers are still using the old card of extras for hoops and bands, but expect to adopt the new card Jan. 1.

Strip Steel.—While concessions of \$2 a ton from regular prices are being made on hot-rolled strip to round lot buyers, mills appear to be holding firmly to the regular 2c., Pittsburgh, base for widths narrower than 4 in. Few mills make the narrow strip, and deliveries are more extended on this than on the wide material, some of the mills making the narrow strip being filled up into January. Cooperage stock is being maintained at the regular 2.10c. base. With the new card of extras, present prices on narrow strip are from \$2 to \$4 a ton higher than those that prevailed on fourth quarter contracts, but the advance is smaller on wide strip. Quite a number of first quarter contracts have been entered. Cold-rolled strip is firm at 2.85c., Pittsburgh and Cleveland, for round lots. Most of the mills are asking 2.95c. for small lots.

Bolts, Nuts and Rivets.—The de-

mand for bolts and nuts is still good. Specifications from jobbers have declined, as usually happens at the approach of inventory time, but the demand from the automotive industry has increased. Rivets are moving in good volume. Present prices on bolts, nuts and rivets probably will be reaffirmed for the first quarter. With steel bars unchanged for that delivery and an advance in wire in doubt, makers see no reason to change prices.

Coke.—Specifications are fair, but there is very little new business. Prices are unchanged. Ohio by-product foundry coke is quoted at \$7.75, Painesville, for December shipment. The demand for domestic coke is rather slow.

Old Material.—There is not much activity in the market, which remains firm at recent prices. While mills have good stocks, they continue to take shipments in fair volume, and dealers apparently are buying enough scrap to fill outstanding orders to sustain prices at present levels. Scrap is

coming out in plentiful volume at these prices.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.50 to \$15.00
No. 2 heavy melting steel.	14.00 to 14.50

New York

Pig Iron Sales Total 18,000 to 19,000 Tons—4000 Tons of Sheet Steel Piling Placed

NEW YORK, Dec. 4.—A total of 18,000 to 19,000 tons of pig iron was closed in the past week by sellers in this district. Consumers are maintaining a steady interest in first quarter requirements, and it is estimated that about 50 per cent of the total needed for this period has been covered by contracts. Despite efforts of Buffalo producers to maintain \$18 per ton, \$17.50 seems to be obtainable on desirable tonnages and eastern Pennsylvania sellers have quoted competitive prices. About 5000 tons of foundry iron for the Dundalk, Md., plant of the Central Foundry Co. has been placed, the greater part reported to have gone to the New England producer for water delivery. The Eagle Iron & Brass Foundry Co., Passaic, N. J., has closed on 2000 tons of foundry iron with a Buffalo furnace. Among current inquiries for first quarter delivery are 500 tons of foundry iron for the Lancaster, Pa., plant of the Burnham Boiler Corporation, Irvington, N. Y.; 150 tons of low silicon foundry iron for the A. P. Smith Mfg. Co., East Orange, N. J., and about 600 tons of foundry grade for the Hilles & Jones plant of the Consolidated Machine Tool Corporation, Rochester, N. Y.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$22.41 to \$22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.89 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania. *Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Reinforcing Bars.—The market has had little activity in the past week. Interest still centers in the 8500 tons of bars required for the Delaware, Lackawanna & Western terminal at Jersey City. These bars will be bought by the Turner Construction Co., general contractor. The contract is likely to be closed during the week. No new projects of outstanding size have come out recently. The general run of small orders is keeping up to expectations for this time of the year. Prices are unchanged.

Warehouse Business.—Prices of black and galvanized sheets have been advanced in the New York district 20c. per 100 lb. on black, to 4.00c., base, and 25c. per 100 lb. on galvanized, to 4.75c., base. For delivery to consumers in northern New Jersey, the black sheet price continues at 4c., base, and galvanized sheets have been advanced 5c. per 100 lb., to 4.75c. The advance is attributed to the strong mill situation rather than to increased local demand. Continued mild weather is contributing to an active market for structural material and some substantial plate orders have been taken recently.

Plates, Shapes and Bars.—Developments of the week have made certain that there will be no advance in prices of plates, shapes and bars for first-quarter contracting. Some companies have informed their customers that their books are open at the fourth quarter prices of 1.90c. and 1.95c., Pittsburgh, or \$3 higher at Eastern plate and shape basing points. Specifications have fallen off somewhat, but are expected to take an upward

turn the middle of the month, when grace expires for entering shipping orders against fourth quarter contracts. One of the largest awards of the week was 4000 tons of sheet steel piling to be furnished by the Bethlehem Steel Co. for a warehouse for the Delaware, Lackawanna & Western Railroad near Jersey City. The city

Warehouse Prices, f.o.b. New York

of New York will require 2800 tons of 60-in. steel pipe for a water line in Queens Borough, on which bids will be taken in about a month. Another municipal project calls for 600 tons of 48-in. pipe for Manhattan.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Cast Iron Pipe.—Private buyers of gas and water pipe are actively inquiring for small lots and some of the usual large tonnages of gas pipe have appeared for spring delivery. About 15,000 tons of gas pipe for the American Light & Traction Co., New York, is understood to have been awarded to the United States Cast Iron Pipe & Foundry Co. A local New Jersey company is asking for bids on about 200 tons of gas pipe, and E. L. Phillips & Co., 30 Church Street, New York, are inquiring for about 850 tons of gas pipe for the Long Island Lighting Co. The Stamford Water Co., Stamford, Conn., is in the market for 700 tons of water pipe. Quotations of northern foundries are steadier, but \$38.60 to \$39.60 per net ton, delivered New York, is still a fair range of the market.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$38.60 to \$39.60; 4-in. and 5-in., \$43.60 to \$44.60; 3-in., \$53.60 to \$54.60; Class A and gas pipe, \$4 to \$5 extra.

Sheets and Strip.—A small amount

of first quarter contracting has been done in sheets and strips, and in all instances the higher prices have applied. It is expected that this month will bring heavy specifying against fourth quarter contracts for hot-rolled strip because the new base prices, plus the new extras, will mean an advance in first quarter of \$2 to \$4 a ton on many widths and gages.

Coke. — Connellsville prices on standard foundry and furnace grades are less firm than a week ago, but no definite decline in prices has appeared. Standard foundry continues at \$3.50 to \$3.75 per net ton, Connellsville, and standard furnace at \$2.85 to \$3.05 per ton, Connellsville. Special brands of foundry coke are quoted at \$4.85 per net ton, ovens, or \$8.56, delivered to northern New Jersey, Jersey City and Newark, and \$9.44, to New York or Brooklyn. The West Virginia producer of by-product foundry coke has not yet opened its books for next year. By-product foundry coke prices are unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Recent sales of No. 1 heavy melting steel to eastern Pennsylvania consumers have been at \$15 and \$15.50 per ton, delivered, the higher price having been on about 1000 tons and the lower quotation on

about 500 tons. Heavy breakable cast has been sold at \$15.50 per ton, delivered, and brokers are offering \$15 per ton on deliveries to eastern Pennsylvania users. The local stove plate market shows less strength and brokers are offering \$11.25 per ton, delivered to West Mahwah, N. J., a reduction of 25c. per ton. Although buying is light, dealers report only a small tonnage of scrap obtainable at the present level of prices.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$11.25 to \$12.00
Heavy melting steel (yard)	8.25 to 8.50
No. 1 hvy. breakable cast.	11.25 to 11.75
Stove plate (steel works)	8.50
Locomotive grate bars	8.50
Machine shop turnings	7.25 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast furn. or steel works)	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought	12.25 to 12.75
No. 1 yard wrot., long	11.25 to 11.75
Rails for rolling	13.00 to 13.50
Cast iron carwheels	12.00 to 12.50
Stove plate (foundry)	9.25 to 9.50
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Unique Steel Structure for Diabetes Patients

THE spherical steel structure shown in the illustration is a large tank just completed at the Cunningham Sanitarium, Cleveland, for use in a new treatment for diabetes and allied diseases that requires the patients to be kept for a considerable time under prescribed air pressure. Fabricated and erected by the Biggs Boiler Works Co., Akron, Ohio, the tank is 64 ft. in diameter and its outside shell is made of ¾-in. flanged steel plate. Its construction required 600 tons of steel. While the fabricating problems involved in building the shell did not differ materially from those met in other classes of work in tank and boiler shops, difficulties were encountered because of the large size of the tank.

All seams were closed with double butt straps and double riveted with 1½-in. rivets. When the last course of plates had been put in place, the top plate was dropped in place with perfectly matched rivet holes. This indicates the accuracy with which the work was fabricated and erected in the field. The sphere has 349 special port lights, part of which are equipped with aluminum covers on the inside. These lights are constructed to open inward on hinges and carry 1½-in. glass.

Inside the sphere a complete five-floor structural building was erected. The interior steel work was designed to allow for contraction and expansion of the outside structure. The

sphere rests on 12 cast steel base lugs, which in turn are supported on concrete bars tied together with a reinforced circular mat. The whole is designed to withstand a wind pressure of 100 miles an hour.

In addition to the sphere there are two air locks, one 16 ft. in diameter and 35 ft. long and the other 16 ft. in diameter and 70 ft. long. Both are equipped with port holes and divided into rooms with a corridor

through the center. Connection with the sphere is made by an entrance lock 10 ft. in diameter and 20 ft. long in the shape of a T. This arrangement allows for using different air pressures between the locks and sphere. The entire equipment is designed for 30-lb. air working pressure and was tested at 50 lb.

The project was financed personally by H. H. Timken, president, Timken Roller Bearing Co., Canton, Ohio.

Inside This Sphere Are a Dining Room, 36 Private Rooms and a Recreation Room, All Served by an Electric Elevator in the Center

Cincinnati

General Advance of 50c. on Southern Pig Iron Expected— Automobile Companies Specify Sheets Heavily

CINCINNATI, Dec. 4.—Southern furnace interests, with the exception of one Alabama producer, still are quoting \$16.50, Birmingham. That an increase to \$17 a ton may become general in a few days or a week is predicted by sellers. Sales the past week were comparatively small and were in sharp contrast with the heavy orders of the previous week. The most important order was for 1500 tons of Northern foundry iron for a nearby consumer. A feature of the market has been the crossing in numerous instances of the lines marking the normal boundaries of the selling territories of certain furnaces. Small quantities of Valley iron are being shipped into Cincinnati and also are going into western Ohio and into Indiana. Other makers have also been taking tonnages which usually are supplied by Lake Erie furnaces. Brokers have been selling small lots of southern Ohio iron at \$18.50, base Ironton, which is the price asked by the Marting Iron & Steel Co. for the iron remaining on its yards. Jackson County silvery iron is quoted at \$26 to \$27, base Jackson, for 8 per cent; since users are well covered for first quarter requirements at the old price, the new schedule probably will not be thoroughly tested for some time.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25 \$20.39
Ala. fdy., sil. 1.75 to 2.25... \$20.19 to 20.69
Ala. fdy., sil. 2.25 to 2.75... 20.69 to 21.19
Tenn. fdy., sil. 1.75 to 2.25 20.19
S'th'n Ohio silvery, 8 per cent 27.89 to 28.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—An increased volume of sheet steel specifications from automobile makers getting into production on new models has given added strength to the position of district mills. Moreover, the liberal flow of tonnage from the Detroit district has been supplemented by well diversified bookings from other sources, so

that backlogs insure the continuation of mill operations at 100 per cent of capacity for at least several weeks. The new prices are holding firm under the test of first quarter buying. Sales of reinforcing bars have been somewhat meager. A maker of rail steel bars is quoting 1.90c. to 1.95c., base mill. The movement of bars, structural shapes and plates has been only fair. Common wire nails are being sold at \$2.69 per keg, delivered Cincinnati.

Coke.—By-product foundry coke will remain at \$7, ovens, during December, but No. 2 nut and walnut sizes have gone up 25c. a ton to \$3.50 and \$4, ovens, respectively. Egg size is unchanged at \$5, ovens. An advance of 50c. a ton on all grades of domestic by-product coke is predicted for Jan. 1. At Detroit, by-product foundry is quoted at a local delivered price of \$9. Domestic grades at Detroit are firm and unchanged, but there may be an increase of 50c. a ton on Dec. 15. Shipments of by-product foundry coke in November were about 20 per cent less than in October, and specifications this month may show a

further recession on account of the reluctance of users to take material at or near inventory time. Sales of by-product domestic coke were about 10 per cent larger in November than in October. New River beehive foundry coke is quoted at \$6 to \$6.50, ovens, and Wise County foundry at from \$4.50 to \$5.25.

Old Material.—Steel plants are accepting less scrap on current contracts than a week ago. Railroad offerings purchased in the past few days by local dealers are reported to have brought less than in the early part of November. However, the market is holding fairly steady, and prices probably will stop at or near present levels until after the first of the year. The Southern has sold a special lot of about 2500 tons of steel rails.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.00 to \$13.50

St. Louis

Pig Iron Buying in Smaller Volume But Prices Are Firm— Steel Bookings Steady

ST. LOUIS, Dec. 4.—The sale of 5000 tons of basic iron by the St. Louis Gas & Coke Corporation to an East Side melter for shipment in December was the principal transaction of the week, in which a total of 7450 tons was sold by the local maker and 1000 tons by a leading Southern interest. The lull, following weeks of heavy buying, seems to indicate that the bulk of first quarter buying is over, although an attractive tonnage is yet to be covered. While the market is still strong and prices unchanged, the tone is not quite as good as it has been, because there is a feeling that present prices will tempt makers to overproduce. The local maker sold 2450 tons of foundry iron, including 350 for immediate shipment and the remainder for first quarter delivery. Stove foundries continue active, and orders for railroad car parts are materially increasing the melt.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.....	\$20.00
Malleable, f.o.b. Granite City.....	20.50

Southern No. 2 fdy., deliv'd.....	20.92
Northern malleable, deliv'd.....	22.16
Northern basic, deliv'd.....	22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Consumption of foundry coke continues on a large scale as a result of the heavy melt in the district, the November consumption being nearly 4 per cent greater than in October. However, buying continues on a hand-to-mouth basis. Domestic grades are moving more rapidly.

Finished Iron and Steel.—Total bookings of new business by the Granite City Steel Co. were slightly greater during November than in the

preceding month. The demand for black, galvanized and blue annealed sheets is well sustained. However, plate business lags, and the volume of tin plate orders is somewhat smaller. Prices continue firm. Warehouse business is satisfactory. Structural fabricators report business is light.

Old Material.—The market for old material is quiet. Mills in the district are delaying all buying, except for fill-in material, until after inventories have been taken, being in a good position to do this because of ample stocks on hand or purchased. Dealers are anticipating a heavy buying movement the latter part of December or the first week in January and have been offering high prices for railroad scrap. The only price changes are in steel car axles and cast iron carwheels, which are 50c. a ton higher. Railroad lists include: Baltimore & Ohio, 13,910 tons; New Orleans & Great Northern, 57 tons; Missouri Pacific, 106 carloads; Frisco Lines, 21

carloads; Mobile & Ohio, 24 carloads; Chicago, Milwaukee, St. Paul & Pacific, 40 carloads; and Louisville & Nashville, 7869 ft. of 68-lb. rails.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 railroad cast.....	14.00 to 14.50
Stove plate	12.50 to 13.00
Agricult. malleable	11.50 to 12.00
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Birmingham

Heavy Buying of Pig Iron for First Quarter—Steel Plant Operations at High Rate

BIRMINGHAM, Dec. 4.—One merchant producer continues to quote \$17 on No. 2 foundry, while others are taking business at \$16.50 except small orders. There has been heavy buying during the past 10 days. Practically all of the larger melters have covered their requirements through March and several of the smaller consumers have contracted for most of their first quarter requirements. Some iron is being sold outside the district. Shipments are holding up well; no iron was stocked during November. The Woodward Iron Co. changed its No. 2 Woodward furnace from foundry to basic on Nov. 21. The furnace of the Gulf States Steel Co. at Alabama City was changed from foundry to basic on Dec. 1. On Nov. 26, the Tennessee company changed its Ensley furnaces Nos. 1, 3 and 6 from foundry to basic and furnace No. 4 from basic to foundry. Of the 19 furnaces in blast, 10 are on foundry, seven on basic, one on ferromanganese and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:
No. 2 fdy., 1.75 to 2.25 sil.. \$16.50 to \$17.00
No. 1 fdy., 2.25 to 2.75 sil.. 17.00 to 17.50
Basic

Finished Steel.—Prices are becoming firmer, following the advance of \$2 a ton on bars, plates, shapes and sheets reported last week. Mills are holding closely to quotations of 2.25c. on bars, plates and shapes. Sheets continue strong. New business in November was slightly ahead of October bookings in all of the more important lines. Inquiries indicate an active market for the next two or three weeks. Plant operations are at a higher rate than at any time in recent years. The Tennessee company has

increased its active open hearths at Ensley from five to eight. Seven are active at Fairfield and the Gulf States Steel Co. is working four at Alabama City. Structural steel fabricators are operating on good schedules with satisfactory tonnage pending. The Ingalls Iron Works Co. has booked an

order for 750 tons for the American Smelting & Refining Co. at Rosita, Mexico.

Cast Iron Pipe.—Pressure pipe makers are booking odd lots for private and contract work, but the total volume is small and below the average for this season. Several municipal feelers for winter buying have come in during the past week and makers are hopeful of specifications by the end of the year. All plants are operating on reduced schedules. Very little stock is being carried and output is being gaged by demand. Quotations are unchanged at \$37 to \$38 on 6 in. and larger sizes.

Coke.—Prospects are brighter for foundry coke. Industrial coke users are covering for the first quarter and interest is also being shown in second quarter. Sales of domestic coke continue at a fairly active rate. Quotations remain at \$5.

Old Material.—Buying is spotty, with the aggregate below the average for November. Lessened production in some fields is having its effect on consumers' demands. Consumers are keeping stocks light for approaching inventories. Prices are the same as quoted last week.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50
Short shoveling turnings..	8.00 to 8.50
Cast iron borings	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	15.00
Tramcar wheels	13.00 to 14.00
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Buffalo

Pig Iron Demand Not Heavy but Prices are Maintained—Steel Mills Operating at Undiminished Rate

BUFFALO, Dec. 6.—Pig iron inquiries and orders the past week have not been heavy, but apparently prices are being maintained in the district. One inquiry from New Jersey is for 1000 tons of foundry and a New England inquiry is for 2000 tons. Two other inquiries from New England for foundry are for 500 and 1000 tons. More purchasing is expected for the first quarter. Shipments from Buffalo furnaces are heavy. Preparations are being made to blow in another Hanna stack. The Bethlehem Steel Co. is now operating six blast furnaces here, the highest number in months. This year has brought a

large increase in pig iron shipments on the New York State barge canal. Actual figures will not be available until next week, but the total probably is over 130,000 tons.

Prices per gross ton, f.o.b. furnace:
No. 2 fdy., sil. 1.75 to 2.25 \$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75 18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25 19.50 to 20.00
Malleable sil. up to 2.25.. 18.50 to 19.00
Basic

Finished Iron and Steel.—Operations at Buffalo mills continue at an undiminished rate. Specifications are satisfactory notwithstanding that the inventory period is close at hand. Prices are firm on the major rolled products, with 2c., Buffalo, quoted on bars, shapes and plates for volume purchasing and 2.10c. for small lots. Specifications from the drop forging industry indicate that this business is maintaining heavy operations. Sheet business is very good, and the prices of 2.85c. for black and 4.10c. for automobile body for first quarter delivery are firm. Reinforcing bars are in light demand, and no important structural contracts have been let. Warehouse business shows no decline.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes.....	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-fin. flats, sq. and hex.....	4.45c.
Rounds	3.95c.
Cold rolled strip steel.....	5.85c.
Black sheets (No. 24).....	4.20c.
Galv. sheets (No. 24).....	4.85c.
Blue ann'l'd sheets (No. 10).....	3.50c.
Com. wire nails, base per keg.....	\$3.60
Black wire, base per 100 lb.....	3.75

Old Material.—New purchases are small, but all dealers have orders to fill. An active market exists for cast iron borings for blast furnace consumption at \$11 to \$11.50. Some lots of this material are going into Pittsburgh and Youngstown districts. A few sales of knuckles and couplers and rolled steel wheels have been made at \$17.50, and some lots of No. 1 cast have brought \$15.75. Dealers are anticipating a better demand for specialties because steel castings business continues to show an upward trend. One steel plant is still regulating shipments of scrap, but the restrictions are not as severe as they have been in the past. A recent purchase of No. 2 heavy melting steel made at \$13.25 establishes a lower figure and a wider spread for this material.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$15.50 to	\$16.50
No. 2 heavy melting steel.	13.25 to	14.00
Scrap rails	15.50 to	16.00
Hydraul. comp. sheets	13.50 to	14.00
Hand bundled sheets	12.00 to	12.50
Drop forge flashings	13.00 to	13.75
No. 1 busheling	14.50 to	15.50
Hvy. steel axle turnings	13.50 to	14.00
Machine shop turnings	7.50 to	8.00
No. 1 railroad wrought	12.50 to	13.00
Acid Open-Hearth Grades		
Knuckles and couplers	17.50 to	18.00
Coil and leaf springs	17.50 to	18.00
Rolled steel wheels	17.00 to	17.50
Low phos. billet and bloom ends	18.00 to	18.50
Electric Furnace Grades		
Short shov. steel turnings	11.00 to	11.50
Blast Furnace Grades		
Short shov. steel turnings	11.00 to	11.50

Canada

Advances of 50c. to \$1 a Ton on Pig Iron Expected to Go Into Effect Soon

TORONTO, ONT., Dec. 4.—While the general trend of business in the Canadian pig iron markets showed very little change during the week, there is still unsettlement with regard to the general price situation. With foundry pig iron selling in Buffalo at \$18 to \$19, Canadian producers have an advantage of 60c. to \$1 per ton in the Toronto market over their Buffalo competitors. Canadian prices, however, are deemed too low by local blast furnace representatives, and there has been considerable discussion of the situation of late. It is pretty well settled that advances of from 50c. to \$1 per ton will go into effect here for first quarter delivery. Shading has disappeared; melters who were quoting 50c. under the general market have come up to the current quotation. The demand for foundry and malleable iron continues to expand.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	\$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	25.00
No. 2 fdy., sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Building trades have not yet been affected by winter weather, and construction work is proceeding at an undiminished rate. Most of the contracts placed during the week involved small tonnages, but fabricators are figuring on several

contracts for from 1000 to 10,000 tons. Approximately 3000 tons of steel will be required for the Canadian National Railways hotel at Vancouver, B. C. Contracts awarded included 250 tons to the Disher Steel Construction Co., Toronto, for factory at New Toronto, Ont., for Ritchie Cut Stone Co.; 75 tons to Standard Steel Construction Co., Welland, Ont., for addition to plant of Grouts, Ltd., at St. Catharines, Ont.; 150 tons to Hamilton Bridge Co., Hamilton, Ont., for addition to building for Hamilton Bakeries, Ltd., Hamilton.

Old Material.—The demand for iron and steel scrap is active, but sales are being held up in some districts because of difficulty in reaching price agreements. Mills are taking in large tonnages and foundries and other consumers are also buying freely. Prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	\$9.50	\$7.00
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings	7.50	6.50
Cast borings	7.50	5.00
Steel turnings	7.00	5.50
Wrought pipe	5.00	5.00

Malleable	13.00	13.00
	Per Net Ton	
	Toronto	Montreal
No. 1 machinery cast	15.00	15.00
Stove plate	9.00	9.00
Standard carwheels	13.00	13.00
Malleable scrap	13.00	13.00

Boston

Pig Iron Sales Extend Into April—Week's Business About 7000 Tons—Scrap Steady

BOSTON, Dec. 4.—Pig iron sales in this territory the past week totaled about 7000 tons, mostly Mystic, Champlain and Buffalo iron, for shipment extending into April. They included a round tonnage to a Worcester, Mass., foundry; 1000 tons No. 1X to another Massachusetts melter, 1000 tons No. 2X and No. 1X to a Providence, R. I., plant and numerous smaller lots. In addition, the Mystic Iron Works sold 1000 tons No. 2X outside of New England at the equivalent of \$18.50 a ton, on cars Buffalo. On large tonnages, buyers claim they can still buy No. 2X Buffalo iron at \$18 a ton, furnace. The most active Buffalo stack, however, is holding at \$18.50, and other New York State and Mystic irons are on an equivalent delivered basis. Buffalo iron for rail and water shipment has been withdrawn from the market. Small lots

of charcoal iron were sold the past week at \$24 a ton, base furnace.

Foundry iron prices per gross ton delivered to most New England points:

*Buffalo, sil. 1.75 to 2.25	\$22.91
*Buffalo, sil. 2.25 to 2.75	23.41
East. Penn., sil. 1.75 to 2.25	\$24.15 to 24.65
East. Penn., sil. 2.25 to 2.75	24.65 to 25.15
Va., sil. 1.75 to 2.25	26.91
Va., sil. 2.25 to 2.75	27.41
Ala., sil. 1.75 to 2.25	23.41 to 25.77
Ala., sil. 2.25 to 2.75	23.91 to 26.27

Freight rates: \$4.91 all rail from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate.

Warehouse Business.—Hexagon poultry netting and wire cloth have been advanced 5 per cent for 1929 delivery. Advances in sheets made outside New England have not been followed here. The movement of all warehouse products out of stock is increasing, although slowly.

Iron Imports.—Imports of pig iron at Boston during November were 2304 tons, consisting of 1423 tons of Dutch and 881 tons of Indian. October importations were 420 tons.

Coke.—New England producers of by-product foundry coke have announced that December shipments on contracts will be made at \$11 a ton, delivered within a \$3.10 freight rate zone. That quotation has been in effect since April, last, when the price to foundries was reduced from \$11.50. Higher foundry coke prices in the first half of 1929 appear unlikely owing to the policy of one oven to make a flat \$11 price instead of the customary sliding scale contract. All ovens are now caught up on contract specifications. Domestic coke is in heavy demand.

Old Material.—Aside from a firmer market for steel turnings and an easier market in forge scrap, old material prices are unchanged. The firmness of steel turnings is due to buying against Pennsylvania mill contracts, while the weakness of forge scrap is attributed to the completion of orders for a Worcester, Mass., user. New England foundries in general are using more scrap than a year ago, but are supplying needs from local or nearby yards from which material can be trucked. The export market for No. 1 and No. 2 steel, mostly automobile, is still \$10.50 a ton, on dock. It is expected that 3500 tons will be cleared this week.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$10.50 to \$11.00
Scrap T rails	10.50 to 11.00
Scrap girder rails	10.00 to 10.25
No. 1 railroad wrought...	11.00 to 11.50
No. 1 yard wrought.....	9.00 to 9.50
Machine shop turnings....	6.25 to 6.50
Cast iron borings (steel works and rolling mill).	6.00 to 6.50
Bundled skeleton, long....	9.00 to 9.25
Forge flashings	9.50 to 9.75
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	6.00 to 6.50
Shafting	14.50 to 14.75
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.50 to 10.00
Rails for rolling.....	11.00 to 11.50
Cast iron borings, chemical	10.00 to 10.25
<i>Prices per gross ton deliv'd consumers' yards:</i>	
Textile cast	\$14.00 to \$14.50
No. 1 machinery cast.....	15.00 to 15.50
No. 2 machinery cast.....	13.00 to 13.50
Stove plate	11.00 to 11.50
Railroad malleable	15.50 to 15.75

Germany Greatly Increases Machinery Exports

WASHINGTON, Dec. 4.—Surpassed only by the United States, Germany now ranks second among machinery exporting countries of the world, according to W. H. Rastall, chief Industrial Machinery Division, Department of Commerce. Record shipments are being made by the German industry, whose exports for the first nine months of the current year may bring the year's total to a figure equal to or more than pre-war exportation. Total exports for the nine months were 397,837 tons, valued at \$162,710,604, against 318,564 tons, valued at \$125,954,122 in the corresponding period of 1927. These figures include machines shipped as reparation deliveries in kind.

Detroit

Employment Declining in Automobile Industry, but Increased Schedules Are Expected After Jan. 1

DETROIT, Dec. 4.—Industrial operations in this district have slowed down, as is usually the case just prior to inventory period. The employment barometer of the Employers' Association shows a consistent drop of about 2500 persons a week. The present employment figure is 274,397—2555 less than a week ago, but 78,504 greater than the figure of a year ago.

The Chevrolet Motor Co. is planning for a production of 1,250,000 cars in 1929. Shipments to dealers are to begin Dec. 15, with a December production of approximately 42,000 cars. The January schedule is estimated at 106,000 cars.

The Auburn Automobile Co. has released certain material orders to cover the first five months of 1929 on the basis of 16,000 units.

The Oakland Motor Car Co. is expected to announce a new line of Pontiacs, larger and more luxurious than the old line. The present construction operations at Pontiac, which will be completed about the first of the year, will increase the capacity of the Oakland-Pontiac plant to about 350,000 cars for 1929. About 3000 additional employees will be required.

The steel work on section 5 of the

Detroit-Windsor tunnel, which includes the customs building and Detroit approach, will be out for figures in about a week. About 800 tons will be required. In the near future figures will be taken on the following: Union Trust Co. Building, Flint, Mich., 1500 tons; also a building for the Detroit Gear & Machine Co. The Flint Auditorium, Flint, Mich., 900 tons, was awarded to the Flint Structural Steel Co.

Indications are that shipments of pig iron will be slightly below those of November owing to inventory and holiday periods. Most melters are covered for their first quarter requirements. Furnaces serving the district will have lowest yard stocks on Jan. 1 of any time in the past five years.

There have been no changes in quotations on old material in this district during the past week.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast....	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets....	12.25 to 12.75
Stove plate	11.00 to 12.00
No. 1 busheling	11.00 to 11.50
Sheet clippings	8.00 to 8.50
Flashings	11.50 to 12.00

Pacific Coast

San Francisco Hotel Takes 2870 Tons of Steel—Prices on a Firmer Basis

SAN FRANCISCO, Dec. 1 (*By Air Mail*).—Demand for iron and steel products on the Pacific Coast during the week eased off, especially as regards large awards. Featuring the market was the letting of 2870 tons of fabricated steel for a hotel in San Francisco for the Methodist Book Concern to the McClintic-Marshall Co. This is the largest structural award placed in this district since May. Prices, generally, seem to be on a firmer basis.

Pig Iron.—Few inquiries or sales involving large lots of foundry pig iron were reported this week. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars this week were the lightest since the early part of June. Only one project in excess of 100 tons was reported. This was 300 tons for a bridge over Mission Bay, San Diego, secured by an unnamed interest. H. E. Doering, Portland, was awarded the gen-

eral contract for a school in that city involving 400 tons and is expected to award a sub-contract for the bars next week. Bids will be opened Dec. 18 on 209 tons for a bridge at Tacoma, Wash. Little or no improvement is noted in out-of-stock prices. In Los Angeles and San Francisco, 1.80c. base, continues to prevail. On merchant bar steel, 2.30c., c.i.f. Coast ports, is being firmly maintained.

Plates.—The Western Pipe & Steel Co. was awarded a pipe line at La Habra, Cal., taking 100 tons. The only inquiry of size in the market is for 125 tons of 18-in. pipe for Vancouver, B. C. No change in prices is noted; 2.25c., c.i.f., is the minimum, with

Warehouse Prices, f.o.b. San Francisco

Base per Lb.

Plates and struc. shapes.....	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{8}$ -in. and over.....	3.15c.
Small angles, under $\frac{3}{8}$ -in.	3.55c.
Small channels and tees, $\frac{3}{4}$ -in. to 2 $\frac{3}{4}$ -in.	3.75c.
Spring steel, $\frac{1}{4}$ -in. and thicker....	5.00c.
Black sheets (No. 24).....	5.00c.
Blue ann'd sheets (No. 10).....	4.00c.
Galv. sheets (No. 24).....	5.40c.
Struc. rivets, $\frac{1}{2}$ -in. and larger....	5.65c.
Com. wire nails, base per keg....	\$3.40
Cement c'd nails, 100 lb. keg....	3.40

2.30c., c.i.f., applying on some of the smaller lots.

Shapes.—In addition to the 2870 tons for a hotel in San Francisco, mentioned above, 570 tons for a bridge at Paradise, Mont., was placed with an unnamed fabricator. Other awards involved lots of less than 100 tons each. A fair tonnage of pending business is before fabricators. Domestic plain shapes remain firm at 2.35c., c.i.f.

Cast Iron Pipe.—Cast iron pipe awards this week were limited. Lewiston, Idaho, placed 109 tons of 2 to 8-in. Class B pipe with an unnamed company. The American Cast Iron Pipe Co. took 776 tons of 18-in. Classes C and D pipe for the Marin Municipal Water District at San Rafael, Cal., and the Pacific States Cast Iron Pipe Co. secured 90 tons of 6-in. Class C pipe for the same company. Bids have been opened on 292 tons of 4 to 8-in. Class C pipe for Friday Harbor, Wash. Seattle has taken bids on the improvement of West Holden Street, calling for 220 tons of 8 and 12-in. Classes B and C pipe. The largest pending business calls for 548 tons for the improvement of Arlington Street, Los Angeles, bids on which go in Dec. 3.

Establishments engaged primarily in the manufacture of aluminum products reported an output valued at \$123,557,112 in 1927, according to the Bureau of the Census. This represented a decrease of 3.3 per cent, compared with \$127,830,756 in 1925. The 1927 production included \$27,990,354 for aluminum ware, principally cooking utensils and household articles; \$27,080,382 for castings, including motor vehicle accessories and parts; \$62,370,107 for all other aluminum products, including bars, plates, sheets and wire; and \$6,116,269 miscellaneous.

New Trade Publications

Pumping Equipment.—Worthington Pump & Machinery Corporation, 2 Park Avenue, New York. Bulletin WP-1003 devoted to general information regarding Worthington pumping apparatus used in mechanical equipment of buildings. Included are steam and electrical pumps for heating systems, vacuum pumps, wells, sump pumps and pumps for fire protection, elevators and lifts, ventilating systems, cold water meters, refrigerators for buildings and compressed air for buildings.

Steel Buildings.—Blaw-Knox Co., Pittsburgh. Bulletin 1057 dealing with Blaw-Knox standard buildings of copper-bearing galvanized steel. Booklet is generously illustrated and provides complete descriptions of all types of buildings provided, as well as construction details of steel sash, doors and windows, roofing materials and other products furnished.

Heating Specialties.—Vapor Heating Co., York, Pa. Bulletins B-141, B-145 and B-146, illustrating and describing new Broomell sliding sleeve modulating valve, Broomell vapor-pressure system and Broomell damper regulator and compound vacuum-pressure gage respectively.

Electrical Equipment.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2119 devoted to Obround condulets, form 7, covers, wiring devices, reducers and branch extensions, with illustrations and full specifications, Bulletin 2122 describing types F and LB condulets.

Industrial Lanterns; Sanding Equipment.—Nichols-Lintern Co., 7960 Lorain Avenue, Cleveland. Booklet devoted largely to company's Universal signal lanterns, flasher controls and reflector units for steel mill, factory and highway use. Booklet also contains detailed description of Lintern electro-magnetic sander for overhead cranes and of N-L mechanical sanders for locomotive cranes.

Ventilating Equipment.—E. I. Du Pont de Nemours & Co., Inc., Fairfield, Conn. "Auxiliary Ventilation for Metal Mines," booklet dealing with ventilation in operation of metal mines and use of Ventube, flexible tubing for this purpose. Numerous photographs of working installations are included, as well as diagrams and charts.

Refining Iron.—Mathieson Alkali Work, Inc., New York. Bulletin No. 285, "Refining Iron with Purite," describes the use and effect of this chemical on cast iron in removing sulphur together with a discussion of other advantages claimed. Its eight pages are well illustrated.

Crushers.—Pennsylvania Crusher Co., Broad and Arch Streets, Philadelphia. Bulletins 2003 and 2004 of 16 and four pages respectively illustrate and describe the Penn-Lehigh and Pennsteel crushers, designed for heavy work on rock, coal, limestone, gypsum and other materials. The Penn-Lehigh type consists of single-roll crushers with rolls 30 and 36 in. in diameter and 48 to 72 in. long. The Pennsteel crusher also is of the single-roll type, but with rolls 21 and 24 in. in diameter and varying from 40 to 60 in. in length.

Temperature Control.—Weaver Brothers Co., Clinton, Mich. Folder 555, two pages, illustrates and describes a Foxboro pickling tank temperature controller for standardized work and uniform results.

Portable Belt Conveyors.—Atlas Engineering Co., Milwaukee. Bulletin 26-B of 16 pages illustrates and describes a line of portable conveyors for loading and unloading purposes, or handling of materials in places where conveyors are not regularly installed. Stacker conveyors are included.

Motor Control.—Cutler-Hammer Mfg. Co., Milwaukee. 4-page folder tendering engineering advice to those who encounter what seem to be difficult problems in motor control.

Rotating Base Aids in Painting

In painting metal drums at the Paraffine Companies, Inc., San Francisco, plant, the drums are placed on a revolving base. The drum is slowly turned, bringing the unpainted areas to within easy reach of the painter and doubling the output as compared with the ordinary method.

Non-Ferrous Metal Markets

Copper Steady and Quiet, Tin Moderately Active and Firm, Lead Advanced, Zinc Sales Large With Price Firm

NEW YORK, Dec. 4.

Copper.—Domestic buying continues in moderate volume with February delivery predominant. Some fill-in requirements are also noted for intermediate positions. Foreign consumers have been more active, particularly Germany, and sales last week were larger than recent previous ones. Total sales to all consumers in November were large, but less than for some months and are estimated at 80,000 to 85,000 tons. Quotations continue firm and unchanged at 16c., delivered in the Connecticut Valley, for electrolytic copper and at 16.25c., c.i.f. European ports. Lake copper is quiet but firm at 16c. to 16.12½c. de-

livered, with sales made for February-March.

Copper Averages.—The average price for Lake copper for November, based on daily quotations in THE IRON AGE, was 16.12½c., New York. The average price of electrolytic copper was 15.75c., refinery, or 16c., delivered in the Connecticut Valley.

Tin.—Except for the opening of the National Metal Exchange in New York Monday, there have been no features of interest in the market. Activity both here and abroad was held back because of the new development. The new exchange deals exclusively in standard tin, which is similar to the same designation on the London exchange and which makes possible dealings in this country in futures, both on the long and short side, or so-called "hedging." The exchange opened auspiciously with sales of 650

tons and with fair activity today at 385 tons. For the week ended Dec. 1, total sales in New York were only 600 tons. Consumers have been showing no interest and dealers were not inclined to operate actively. Yesterday, after the close of the new exchange, 200 tons of Straits tin was reported sold. Today, the market has been quiet, with spot Straits tin quoted at 52.50c., New York. London prices today, which were down sharply from yesterday, were close to those of a week ago, with spot standard quoted at £239, future standard at £237 5s. and spot Straits at £239 2s. 6d. The Singapore market today was £242. Deliveries of tin during November were 7145 tons, with 3603 tons in stock and landing on Nov. 30.

Lead.—Yesterday the American Smelting & Refining Co. advanced its contract price from 6.35c. to 6.50c.,

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig.....	53.75c. to 54.75c.

Brazed Brass Tubes.....		28.50c.

New York. This advance had been foreshadowed by a steadily rising market at St. Louis, which yesterday was 6.30c. and today is 6.32½c. to 6.35c. Sales, which have been heavy for some time, have continued in good volume, with practically all consuming lines represented. Deliveries extended into January.

Zinc.—Buying by both consumers and dealers continues brisk, and prices are very firm for prime Western zinc at 6.35c., East St. Louis, or 6.70c., New York. The heavy buying of recent weeks was reflected last week in the ore market, where over 22,300 tons was reported sold, about double the recent normal quantity. Production was estimated at about 12,000 tons, which is relatively low, and shipments were close to 15,000 tons, the largest week in many months. Ore stocks have been substantially reduced, being estimated now at about 51,000 tons. The feature is the fact that ore still stands at \$40.

Antimony.—The market for Chinese metal is quiet at 10c., duty paid, New York, for all positions.

Nickel.—Wholesale lots of ingot nickel for this year's delivery are quoted unchanged at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb. The International Nickel Co. announces that electrolytic nickel cathodes, 99.95 per cent, are included for next year's delivery at the same prices as charged for ingot and shot nickel during 1928. Prices on the latter form remain unchanged for 1929.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Markets at Chicago

CHICAGO, Dec. 4.—Both forward buying and spot sales are quiet. Prices for tin and lead are advanced. The old metal market is without feature.

Prices, per lb., in carload lots: Lake copper, 16.50c.; tin, 54c.; lead, 6.40c.; zinc, 6.45c.; in less-than-carload lots: antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

New Circuit Breaker for Small Installations

A new oil circuit breaker, type FK-33, has been announced by the General Electric Co. for manual or electric operation. The devices are rated 4500 volts, 200 and 400 amperes, and are 2, 3 and 4-poles, single and double-throw. The circuit breaker is recommended for use in small plant and industrial installations.

The American Road Builders' Association will hold its annual convention and road show at the Cleveland Auditorium, Jan. 14 to 18, 1929.

Railroad Equipment

Atchison Inquires for 3400 Freight Cars

INQUIRY from the Atchison, Topeka & Santa Fe for 3400 miscellaneous freight cars, in addition to 1075 on which bids were asked last week, is the feature of the market. An oil company has ordered 200 tank cars, but outside of this purchases were negligible. The Louisville & Nashville has come into the market for 24 locomotives. Details of the week's business follow:

Richardson Refining Co. has ordered 200 tank cars from General American Tank Car Corporation.

New York Central has given contract for rebuilding 50 70-ft. steel underframe coaches to American Car & Foundry Co.

Boston & Maine is inquiring for 10 baggage and mail cars.

Chicago, South Shore & South Bend has purchased two caboose cars from American Car & Foundry Co.

Lehigh Valley is inquiring for two gas-electric rail motor cars and four trailer cars.

Warner Quinlan Co., New York, has ordered 10 10,000-gal. insulated tank cars from General American Tank Car Corporation.

Mukden-Hailung, Mukden, Manchuria, has ordered steel parts for 60 steel underframe high-side gondola cars and 40 steel underframe box cars from Pressed Steel Car Co.

Chesapeake & Ohio has ordered two dining cars from Pullman Car & Mfg. Corporation.

Atchison, Topeka & Santa Fe is in market for 2000 box cars, 400 50-ton

gondola cars, 250 70-ton gondola cars, 100 hopper cars, 150 sulphur cars, 500 refrigerator cars, 10 chair smoking cars, 10 mail and baggage cars, 10 chair cars and 10 Jim Crow cars. All of these are in addition to cars inquired for last week.

Louisville & Nashville is in market for 24 Mikado type locomotives.

Reinforcing Steel

Commercial Building Will Take 2500 Tons

ARAILROAD commercial building at Philadelphia, calling for 2500 tons, accounted for a large part of the 3100 tons of reinforcing steel required for projects brought out in the last week. The following awards took less than 600 tons:

OAK PARK, ILL., 150 tons, store, to Olney J. Dean & Co.

OAK PARK, 120 tons of rail steel bars, apartment building, to Calumet Steel Co.

SAN DIEGO, CAL., 300 tons, Mission Bay causeway, to unnamed interest.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

PHILADELPHIA, 2500 tons, reinforcing bars for Reading Commercial Building; bids originally taken for all structural steel.

CLEVELAND, 200 tons, Robert Fulton and Louis Agassiz schools.

TACOMA, WASH., 209 tons, bridge on Tacoma Avenue; bids Dec. 18.

SACRAMENTO, CAL., 188 tons, bridge at Benham; Paul White, Santa Monica, low on general contract.

Steel Castings With a Stainless Coating

ANEW product among stainless steel materials has been developed by the Bethlehem Steel Co., Bethlehem, Pa. It is offered under the name of "Stainless-Clad Steel Castings," and it is claimed that this new development in foundry work imparts many desirable and important qualities to castings in an economical and practical manner.

Bethlehem stainless-clad castings are steel castings with a coating of ferrochromium made by a patented process. Either carbon steel or alloy

tion, and can be put on those surfaces that require heat resistance, acid resistance or exceptional wearing qualities. The stainless coating is pointed to as thoroughly amalgamated with base metal so that it cannot be chipped, pounded off or separated by any mechanical means.

It is described as hard and tough, especially durable under conditions where service with extreme heat and resistance to all organic and most inorganic acids is desired. Other alloy elements or metals can be used in the

Cross Section of a Stainless-Clad Steel Casting Etched to Show the Coating

steel is used as the base metal of the casting, depending upon the requirements of the service for which it is intended.

The coating is an integral part of the casting, as shown by the illustra-

coating so as to produce castings having properties to meet different service conditions. It is also stated that the economy of using such castings is considerable because of the low cost of service per hour.

PERSONAL

W. J. JACK has been named manager of the strip steel division Republic Iron & Steel Co., Youngstown, taking the place of F. H. LOOMIS, recently advanced to assistant general manager of sales of the company. Mr. Jack was with the Trumbull Steel Co. for 11 years prior to its absorption this year by the Republic company, and also had experience in the manufacture and sale of strip steel with the West Leechburg Steel Co.

MAJ. ARTHUR A. WEDDERSPOON has resigned as Indiana district sales agent General Refractories Co., Philadelphia, to accept a position in London. He was in the Pittsburgh office of the company for about two years prior to the establishment of the Indiana district sales office at Indianapolis on Jan. 1, 1926. He served with the British forces during the World War. The company has closed its Indianapolis office and Indiana district sales hereafter will be handled from the Cleveland office. HOMER C. WALLACE has been transferred from the Philadelphia to the Cleveland office of the company.

DR. EDWARD E. MARBAKER, industrial fellow in the Mellon Institute of Industrial Research, Pittsburgh, will speak before the Chicago Foundrymen's Club, Thursday evening, Dec. 6, on the subject of "Cast Iron: Its Manufacture."

M. F. TIGHE again has been elected president of the Amalgamated Association of Iron, Steel and Tin Workers and now enters upon his tenth term as head of that organization. DAVID J. DAVIS has been reelected secretary-treasurer, LOUIS LEONARD assistant secretary, and BEN I. DAVIS, managing editor of the *Amalgamated Journal*, official organ of the association. JACOB S. MCGINLEY continues as vice-president of the boiling and finishing division, and EDWARD W. MILLER is vice-president of the sheet and tin plate division.

GRANT B. SHIPLEY, recently appointed a member of the National Committee on Wood Utilization, is president of the Century Wood Preserving Co., Pittsburgh, and of the American Mond Nickel Co.

GEORGE W. DENYVEN retired Dec. 1 as New England sales representative of the Champion Rivet Co., Cleveland, and was succeeded by HENRY J. LINN, who has been his assistant. The company's office is at 250 Stuart Street, Boston.

W. B. MARSHALL has been appointed sales manager of the contract engineering department, Chain Belt

Co., Milwaukee. He has been associated with the company since 1921, when he was graduated from the Sheffield Scientific School of Yale University. He began as a student apprentice and after several years' work in the shops and foundries he was made secretary to the general manager and later spent some time in the Chicago office. In 1926 he returned to Milwaukee and was engaged in contract engineering sales work until his recent appointment.

VERYL PRESTON, for some years president of the Eastern Steel Co., has become associated with the New York Stock Exchange house of McClure, Jones & Co., 115 Broadway, New York.

C. E. GEORGE, for many years Western manager of the American Schaeffer & Budenberg Corporation, Brooklyn, has joined the Chicago sales staff of the Taylor Instrument Companies, Rochester, N. Y., with headquarters at 58 East Washington Street.

DR. V. N. KRIVOBOK, associate professor of metallurgy at the Carnegie Institute of Technology, Pittsburgh, will speak on "Recent Developments in the Study of Iron-Manganese Alloys of Purity," at a meeting of the Cincinnati chapter of the American Society for Steel Treating, to be held at the Engineers' Club on Thursday evening, Dec. 6.

ARTHUR L. COLLINS, since 1922 sales metallurgist for Horace T. Potts & Co., Philadelphia, has been made manager of the company's tool and alloy steel division. He is a graduate of the Stevens Institute of Technology, Hoboken, N. J., and is at present on the lecture staff in the metallurgical department of Temple University, Philadelphia.

EUGENE W. SMITH, general foundry superintendent for the Crane Co., Chicago, spoke before the Wisconsin Gray Iron Foundry Group in Milwaukee on Dec. 5. His subject was "Molding Sand Control in the Foundry and the Use of Artificial Binders as Substitutes for Natural Bond in Molding Sand."

HORACE C. KNERR, consulting metallurgical engineer, Philadelphia, will address the Boston chapter of the American Society for Steel Treating at a meeting to be held at the West Lynn, Mass., plant of the General Electric Co. on Friday evening, Dec. 7. In a paper entitled "Duralumin and Other Aluminum Alloys," he will discuss the use of non-ferrous alloys

and other metals in the manufacture of aircraft.

J. T. GAFFNEY, for four years foundry and pattern shop manager for the Toledo Machine & Tool Co., Toledo, Ohio, has resigned. He has announced no new connection and is at present located at 2723 Monroe Street, Toledo.

GEORGE E. JOHNSON, New York representative for the Saginaw Stamping & Tool Co., Saginaw, Mich., has been appointed general sales manager for that company. Manning, Maxwell & Moore, Inc., 100 East Forty-second Street, New York, has been appointed exclusive distributor in the New York territory.

HARRISON J. BEHR, for the last seven years associated with the Mechanical Rubber Co., Cleveland, division of the United States Rubber Co., has joined the sales organization of the Boston Woven Hose & Rubber Co., Boston, as special field representative. Before going with the Mechanical company, he was identified for 12 years with the B. F. Goodrich Rubber Co., Akron, Ohio.

E. D. GIBERSON, president E. D. Giberson & Co., 40 Rector Street, New York, agents in the eastern United States of Ferrostahl G.m.b.H., will leave Dec. 10, for a six weeks' trip in Germany, France, Belgium and Austria. He will be the guest during the holidays of ERNST DAMM, of Dusseldorf, vice-president in charge of European plants of the Yale & Towne Mfg. Co., Stamford, Conn.

BENEDICT CROWELL, chairman of the board of the Crowell & Little Construction Co., Cleveland, has been made a director of the Chamber of Commerce of the United States, succeeding R. P. LAMONT, president American Steel Foundries, Chicago, who has been made vice-president for the Northern Central Division.

ALVAN MACAULEY, president Packard Motor Car Co., Detroit, who was recently elected president of the National Automobile Chamber of Commerce, was the guest of honor at a recent dinner given on his eighteenth anniversary with the company.

ABRAM F. MYERS assumed office Dec. 1 as chairman of the Federal Trade Commission, succeeding WILLIAM E. HUMPHREY, who, following the rules of rotation of the commission, served one year.

The annual meeting of the Power Transmission Association will be held at the Hotel Commodore, New York, Thursday, Dec. 6. The association's booth at the Power Show, held in New York Dec. 3-8, is No. 646.

O B I T U A R Y

CHARLES SEITZ, resident manager of the Addyston, Ohio, plant of the United States Cast Iron Pipe & Foundry Co., was killed in an automobile accident Dec. 1. He was 53 years of age and had been in the company's employ for more than 20 years. His first assignment was at Addyston and later he was appointed superintendent of the Scottdale, Pa., plant. About a year ago he returned to Addyston as resident manager.

WILLIAM L. RODGERS, founder and president of the Pittsburgh Gage & Supply Co., Pittsburgh, died at his home in that city Dec. 2. He had been in poor health for some time. He also was the founder and head of the Gainaday Electric Co., manufacturer of electric washing machines and other household electrical appliances.

ALMOS D. NEELD, who was noted for his table of safe loads and stresses for plate girder bridges and for steel roof trusses, and was prominent in construction engineering for almost 50 years, died at his home in Crafton, Pa., Nov. 28. He was born in Pittsburgh Feb. 15, 1858, and was graduated in 1875 from the Western University of Pennsylvania, now the University of Pittsburgh.

RALPH H. BOURNE, who resigned as senior vice-president of the Whiting Corporation, Harvey, Ill., in November, 1927, died Nov. 27, at Wareham, Mass. He was graduated in mechanical engineering from Cornell

University in 1905 and for a time was employed by the Wellman-Seaver-Morgan Co., Cleveland, and later by the Hoover & Mason Co., Chicago. In 1907 he became associated with the Whiting Foundry Equipment Co., now the Whiting Corporation.

VAN LOAN WHITEHEAD, chairman of the board of the Whitehead Brothers Co., Buffalo, maker of foundry supplies and equipment, died in that city on Nov. 10 as the result of injuries sustained the day before when he was run down by an automobile. He was born in 1857 and had been associated with the foundry industry for many years.

BERTRAND G. MACKEY, for 18 years purchasing agent for Goulds Pumps, Inc., Seneca Falls, N. Y., died at his home in that city on Nov. 26, following a long illness. He was born at Locke, N. Y., in 1875 and went with the Gould company in 1906 as assistant purchasing agent. He was made purchasing agent in 1908 and held that position until 1926 when he resigned on account of ill health.

GEORGE M. STEDMAN, for many years president of the Stedman Foundry & Machine Works, Aurora, Ind., died at Columbia Hospital, Milwaukee, on Nov. 27 after a long illness, aged 62 years. He had retired four years ago because of failing health and recently had made his home in Milwaukee.

New 42 and 48-In. All-Geared Motor Driven Lathe

(Concluded from page 1437)

lever on the carriage. There are also knobs on the carriage for engaging the power longitudinal feed and the cross feed, plain or angular, as well as a lever for engaging the half nuts with the lead-screw. The reverse handle for the feeds, and the rapid traverse lever, which controls the motor for traversing the tool carriage in either direction, is also located on the carriage. An automatic stop is provided for the carriage. A chasing dial, which can be swung into an inoperative position when the lathe is not being used for chasing threads is also furnished.

Lead screw and rod hangers are furnished to carry the weight of the lead screw and feed rod. These hangers are engaged and released by hooks attached to both sides of the carriage in such a way that they are pushed or pulled along the outer bed vee and automatically locate themselves at fixed intervals. The tailstock arrangement includes a handwheel that permits the operator to center work

or perform boring operations with minimum effort.

The bed of the machine is of deep girder planer type. The compound rest is of new design. Taper attachment, with taper-turning capacity of 6½ in. per ft. for the full distance between centers can be supplied. A steadyrest with 18½ in. opening and screw adjustable jaws is regular equipment. Follow and full swing rests, extra gears and index plates are available as extras.

A course of lectures on cost reduction is to be given by Dr. Robert Grimshaw on Thursday evenings beginning Feb. 9 at the College of the City of New York. The course is intended for manufacturers and business men as well as students and the fee is \$10. For information one may address Walter Stalb, Bursar, 140th Street and Convent Avenue, New York.

Plan Large Brass and Copper Merger

Directors of the Rome Brass & Copper Co., Rome, N. Y., have approved a plan to merge with six other companies to form the General Brass Corporation. Companies to be included are the Taunton-New Bedford Copper Co., Taunton and New Bedford, Mass.; the Baltimore sheet mill of the General Cable Corporation; the Rome Mfg. Co., Rome, N. Y.; the Michigan Brass & Copper Co. and the Higgins Brass & Mfg. Co., Detroit, and the Dallas Brass & Copper Co., Chicago. The merger is expected to bring about 20 per cent of the country's brass and copper business under one control. Factories of the constituent companies will continue to operate with unchanged management and each organization will be represented on the executive committee of the new corporation.

Cincinnati Car Co. Absorbs Versare Corporation

Directors of Cincinnati Car Co., Cincinnati, have approved terms of merger with the Versare Corporation, Albany, N. Y., under which manufacturing operations will be centered in Cincinnati. The company will manufacture interurban and street cars, gasoline-powered industrial locomotives and a new type of automobile bus. The new company, to be known as the Cincinnati Car Corporation, will be headed by H. L. Sanders as president. O. F. Warhus, designing engineer of the Versare Corporation, will become vice-president. Randal MacDonald, treasurer of the Versare Corporation, will be assistant to the president.

Pontiac Foundry to Install \$200,000 Conveyor System

The plant of the Wilson Foundry & Machine Co., Pontiac, Mich., will be shut down the week of Dec. 10 to permit the installation of a new \$200,000 conveyor system. The conveyor, of the continuous chain type, is expected to carry about 2500 castings per day from the foundry to the cleaning department of the machine shop.

An export day, so called, Dec. 6, has been set apart by the Seventh National Exposition of Power and Mechanical Engineering to be held at Grand Central Palace, New York, Dec. 3 to 8. The export day program is to be marked by the assembling of the members of the various foreign departments of the exhibitors to answer questions peculiar to exporting. The foreign attendance last year, it appears, brought representatives from 33 foreign countries and five insular possessions of the United States.

Industrial Wages at Higher Level

Analysis of employment and wage conditions among 800,000 workers in 1500 manufacturing establishments by the National Industrial Conference Board, New York, discloses that the real incomes of industrial wage earners this fall have reached their highest level since the inflation of 1920. Outstanding in the situation is the marked stability of wage rates and of earnings. Since 1923 these have fluctuated less than 5 per cent.

During the past year the highest figure for hourly earnings was 234, in September, and the lowest, 231, in February and May, both being based on 100 as the average of July, 1914. Weekly earnings during 12 months had a maximum of 221 in September, 1928, and a minimum of 213 in November, 1927. Employment in September was more than 6 per cent above the low point reached in November, 1927. Total hours worked in September were 10.8 per cent higher than in November of last year.

Canadian Output Gained in October

TORONTO, ONT., Nov. 30.—Production of pig iron in Canada in October amounted to 93,186 gross tons, a 3 per cent gain over the 90,516 tons made in the previous month and more than double the 38,097 tons produced in October, 1927. Compared with September, when the output of basic iron reached 57,424 tons, October output showed a considerable gain with a total of 65,625 tons; malleable iron rose from 11,800 tons in September to 13,622 tons in October; foundry iron, of which the production was 21,292 tons in September, declined to 13,739 tons in October. The decline in the output of foundry iron, however, had no bearing on sales or shipments to melters as there are still large tonnages of this grade of iron piled for immediate delivery to consumers.

For the 10 months ended Oct. 31, the production of pig iron in Canada was 838,659 gross tons, an increase of 38 per cent over the 608,511 tons produced during the corresponding period of 1927, which in turn was 4 per cent under the 631,187 tons produced in the 10 months of 1926. This year's blast furnace production included 591,274 tons of basic iron; 174,715 tons of foundry iron and 72,760 tons of malleable iron.

The number of furnaces in blast at the end of October remained the same as on Sept. 30.

Production of ferroalloys in Canada in October at 2127 tons showed a slight increase over the 2008 tons reported for September. The total for 10 months was 35,541 tons, compared with 47,649 tons in the corresponding period of 1927.

Production of steel ingots and castings during October at 108,987 tons was 9 per cent over the output of

99,888 tons in September and almost double the total of 56,371 tons produced in October last year. For the 10 months ended with October the production of steel ingots and direct steel castings totaled 1,028,697 gross tons, or an increase of 41 per cent over the 730,660 tons produced in the corresponding 10 months of 1927, which in turn was 9 per cent greater than the 664,084 tons for 1926.

Related Wage Payments to Pig Iron Production

Wage payments in blast furnace plants in Pennsylvania have declined 57 per cent from the peak reached in 1923 and early 1924, according to figures gathered by the Department of Labor and Industry of the Commonwealth of Pennsylvania. Along with this decline in payrolls there has been a similar but less pronounced decline in the production of pig iron in the State, this having shown a drop of 43 per cent to the end of 1927. "The relatively greater decline in payrolls does not reflect lower wages," says the report, "since employment has decreased to a like extent; but appears to indicate greatly increased output per worker."

There is a wide divergence between the evidence in the chart shown and

Comparison of Payrolls with Pig Iron Shows How Output per Worker Has Increased

that for other industries in the State. Practically without exception, the others have shown a reasonable parallelism between wages and production. Evidently the drastic cost-cutting effort which has been carried through so successfully by the iron and steel industry has not been so large a feature in other industries included in the survey.

Larger Tonnage of Steel Ships

WASHINGTON, Nov. 30.—On Nov. 1 American shipyards were building, or were under contract to build, for private shipowners 423 steel vessels of 223,566 tons gross register. This compares with 433 steel vessels of 205,820 gross tons on Oct. 1, according to the bureau of navigation, Department of Commerce.

Year's Ore Shipments 5 Per Cent Over 1927

CLEVELAND, Dec. 3.—Shipments of Lake Superior ore by water during 1928 amounted to 53,980,874 gross tons, a gain of 5.6 per cent, or 2,873,738 tons, over the movement of 51,107,136 tons in 1927. Shipments in 1926 were 58,537,855 tons. In 1925 they were 54,081,298 tons, or approximately the same as this year.

Water shipments in November were 4,260,942 tons, or more than twice the amount shipped in November, last year. With the absence of severe November storms, weather conditions were fairly good for shipping ore during the month and shippers kept up so well with their schedules that few cargoes were moved during the last week of November. Usually in previous years a few cargoes were shipped in December, although in 1927 the last cargo started down the lakes before the end of November.

All-rail shipments this year are expected to run slightly below those of last year, when the all-rail movement amounted to 1,236,200 tons. The combined water and all-rail shipments this season will run somewhat over 55,000,000 tons.

Shipments by ports for November, for the entire year and for 1927, and total water shipments for ten years are listed below:

Lake Ore Shipments by Water, Gross Tons

	November	Season 1928	Season 1927
Escanaba	551,836	5,487,556	5,865,224
Marquette	309,170	3,410,902	3,238,855
Ashland	525,443	6,481,153	6,239,774
Superior	1,120,011	15,413,694	14,627,936
Duluth	1,360,247	17,454,063	15,432,188
Two Harbors	394,235	5,733,501	5,703,159
Total	4,260,942	53,980,874	51,107,136
1928 increase			2,873,738

Water Shipments of Last Ten Years, Gross Tons

1919...	47,177,395	1924...	42,623,572
1920...	58,527,226	1925...	54,081,298
1921...	22,300,726	1926...	58,537,855
1922...	42,613,229	1927...	51,107,136
1923...	59,036,705	1928...	53,980,874

Totaling 116,951, applications received by the United States Patent Office during the last fiscal year set a record and exceeded by 3168 the number received the previous fiscal year, according to the annual report of Commissioner Thomas E. Robertson. The commissioner repeated prior statements to the effect that the work of the Patent Office is seriously hampered because of the insufficient number of technical examiners.

Farm implement production during the first nine months of 1928 as reported by 74 companies in the United States was 28.8 per cent above the corresponding period of 1927, according to a report by the Federal Reserve Bank of Chicago. The sales of threshers, tractors and combines increased 38.4 per cent. Purchases of light equipment and of barn equipment gained 6.2 per cent and 6.3 per cent, respectively.

Lockout By German Mills Terminated

Employers and Unions Agree to Arbitration — Increased Shipbuilding
Expected to Aid British Steel Industry

(By Cable)

LONDON, ENGLAND, Dec. 3.

THE pig iron market is quiet, but the outlook is regarded more favorably as the Government derating plan, effective from Dec. 1, should bring a considerable reduction in costs of production. Consumers are expecting to benefit by the plan, but Cleveland producers are still firm in their quotations.

Hematite iron is stronger as a result of restricted output, but export buyers are not inclined to follow the rise in prices and makers are accepting 6d. to 1s. (12c. to 24c.) per ton less for such business. Foreign ore continues quiet.

New shipbuilding is improving. Clyde orders for November totalled 100,000 tons. The Clyde output in November was 12 vessels of 56,600 tons. Steel makers are expecting to benefit by the new shipbuilding contracts, but the heavy plants are at present in decided need of tonnage.

The British Southern Railway has placed an order with British makers for 5000 tons of steel sleepers, which is the first contract of this nature placed here for British railroad use.

Tin plate inquiry is improving with the tin market strong, but business is still inactive, mills needing orders for December. Some mills have begun their agreed period of idleness although most are well booked for delivery early next year.

Galvanized sheets are active in small lots. Black sheets are quiet except for some sales of heavy gages to Japan.

The Ruhr lockout is ended and work is being resumed, both parties having agreed to a settlement by Government arbitration. The steel market is consequently easier with sellers actively seeking orders. Some inquiry for semi-finished material is in the

market from British users, but business is otherwise quiet.

The German output in October was 1,016,000 tons of pig iron, 1,306,000 tons of raw steel and 1,032,000 tons of rolled steel products. The Saar production in October was 169,000 tons of pig iron and 190,000 tons of raw steel. Luxemburg's production in October was 236,000 tons of pig iron and 229,000 tons of raw steel.

British Steel Mills Seek Tonnage

German Lockout Brings No Increase in Orders—Pig Iron Improves—Tariff Advocates Active

LONDON, ENGLAND, Nov. 23.—Although three weeks have passed since the German lockout began, British producers are still awaiting the increased volume of orders that was expected to be diverted from German mills. Recent reports indicate that there are sizable stocks of material in Germany and, as a number of the finishing mills are involved in the lockout, it has been found necessary to seek export outlets. The German Steel Works Association has granted authority for the release of a specified tonnage of material for export.

The British pig iron market is still active. Cleveland iron is once more becoming established as a factor in

foreign markets, and domestic demand is also improving. Stocks are small, and more furnaces are going into blast. Statistics in the *Labour Gazette* show that employment at blast furnaces in October gained 3.7 per cent, although remaining 7.9 per cent below average employment for the year. Employment in the finishing mills continues unsatisfactory, having registered a further decline of 2.3 per cent in October. The total for that month, however, was 2 per cent above the average for the year.

Advocates of protection are still urging that iron and steel be included in the Safeguarding of Industries Act, but the Prime Minister has re-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.	£0 17½s*		\$4.25	
Bilbao Rubio ore*.....	1 2	to £1 2½s.	5.35	to \$5.48

affirmed his previous statements that no further steps in that direction will be taken during the existence of the present Parliament. It is apparent, however, that the safeguarding of iron and steel will be one of the important issues in the coming general election.

As a whole, the steel industry is not prosperous, although certain branches show improvement. Business in galvanized sheets is better, and mills producing light materials are more active. Tin plate mills are well booked with business for delivery during the early part of the coming year, but have insufficient tonnage for current operations. The heavy rolling mills are still in need of orders. A number of shipbuilding contracts have been awarded to British yards, but it will be some time before the orders for material for these ships are actually placed. Export business is poor, but should the German lockout be prolonged, it is believed that Dutch and other Continental shipyards will turn to British mills for their requirements.

German Lockout Had Less Effect Than Expected

(By Radiogram)

BERLIN, GERMANY, Dec. 3.

LOCKOUT of steel workers in the Rhenish and Westphalian districts has been terminated.

Domestic prices of the syndicates for pig iron, semi-finished steel and rolled materials are unchanged. The ingot steel syndicate's price rebates to exporting manufacturers are unchanged for December.

Home markets are quiet. There is no shortage of materials, except for semi-finished products locally. Export prices in the past few days have been weaker. Steel bars are down to £6 a metric ton (1.32c. a lb.), f.o.b., and further weakening is expected.

There is a shortage of bands and wire products for export, but the effect of the lockout on steel exports generally has been less than was anticipated. It will take a week or two to resume full production in the lockout area, where the works have orders ahead for from six to eight weeks.

No Central German Lockout—Other Plants Close

HAMBURG, GERMANY, Nov. 17.—The demand of workmen in steel mills of central Germany for an increase in wages has been withdrawn, and there will be no lockout at these plants on Dec. 1. Central German works produce about 50,000 tons of pig iron and 55,000 tons of rolled products a month. This decision has influenced the metal workers in Saxony, who will not present demands for wage increases when their present agreement expires.

The lockout in northwestern Germany, which began Nov. 1, will extend to western Westphalian pro-

ducers of wire, bolts, rivets and general hardware. This district contributes about 34 per cent of the wire, 67 per cent of the bolts and nuts and 52 per cent of the rivets made in Ger-

many. The workmen at these plants have refused to extend their present wage agreement after Dec. 1, and the employers have announced a lockout, effective Nov. 30.

Opposition to Cartels Grows

Large German Steel Mill Advocates Open Competition—International Steel Scrap Syndicate Suggested

HAMBURG, GERMANY, Nov. 17.—Recent reports state that Gutehoffnungshütte A. G., Oberhausen, Rhine, one of the largest German steel producers, is to enter into active opposition to the present cartels and associations in Germany. It is pointed out that the German and international cartels have not brought about the expected results, and that Government interference has operated against their success in Germany. A return to open competition is urged, with loose agreements to prevent disastrous price cutting. It is suggested that open competition for business, especially in the export field, would be preferable to the present operation through cartels and syndicates organized in their present form.

Despite opposition to cartels, it is said that negotiations in the interests

of a steel scrap syndicate have been initiated by the Grangesborg A. G., which controls the iron ore production of Sweden and most of the North African mines. This company is reported to have proposed a combination of French, Belgian and German iron and steel scrap merchants with a view to controlling the scrap market.

The recently formed international tube, strip and hoop steel cartel has begun to quote export prices, but a large available supply in the hands of merchants and need for tonnage on the part of non-member mills is bringing out lower prices. The official quotation of £6 10s. (\$31.59) per ton for 2-in. and £6 5s. (\$30.38) for 2-in. to 8-in. tube strips is shaded 1s. to 2s. (24c. to 48c.) per ton by non-members and merchants.

Japanese Prices Are Lower

Increased Value of Yen Causes Price Reductions—Large Wire Rod Consumer Temporarily Suspends

THE October report of A. Cameron & Co., Kobe, Japan, on conditions in the Japanese iron and steel market, states that imports of black sheets in September showed an increase of 3270 tons compared with the previous month. Of total arrivals of 21,347 tons of black sheets at Kobe, Yokohama and Osaka, Britain furnished 12,614 tons, the United States 6507 tons, Germany 2096 tons, Sweden 5 tons, and all other countries 125 tons. As a result of the increased importation of black sheets the quotations of merchants declined from 72.50 sen (33.21c.) per sheet to 71 sen (32.52c.) per sheet for the American product, and from 71.50 sen (32.75c.) per sheet to 70 sen (32.07c.) for British sheets. For the first half of October the domestic producer of sheets, the Kawasaki Dockyard Co., reduced its price 50 sen (23c.) per ton and for the second half 1 yen (45.81c.) per ton. The domestic price for January delivery is 193 yen (\$88.41) per ton.

Throughout October tin plate was quiet and prices developed considerable weakness as the month advanced, being affected by recovery of the yen in foreign exchange, which forced small holders to dump their stocks on the market. The highest price paid during the month for British tin plate was 20.50 yen (\$9.39) per box of 170 lb. and the lowest price was 19.20

yen (\$8.80) per 170-lb. box, which was less than the cost of replacement. The price for American tin plate in 170-lb. boxes ranged from 22 yen (\$10.08) early in the month to 21 yen (\$9.62) at the end of October.

The wire rod market was weak during the month as a result of continued heavy arrivals of rods from European mills. Quotations were about 105 yen (\$48.10) per ton early in the month, declining to a low point of 95 yen (\$45.23) by Nov. 1. A factor in this decline of prices was the suspension of a large wire mill in the Osaka district, which closed temporarily following an altercation with the Daiki Electric Railway Co., its source of power supply. This mill consumes about 1500 tons of wire rods a month.

More Steel Houses in Germany

HAMBURG, GERMANY, Nov. 17.—Construction of steel dwellings in Germany is increasing. The city of Düsseldorf, which contracted for 162 such houses last spring, has placed new orders for 82 of the same design and 246 of three other designs, to be erected next spring. Other cities in Germany have ordered 1000 steel dwellings since Oct. 1.

Our Foreign Trade Expansion Aids Europe

Dr. Julius Klein of Department of Commerce Says Our Purchases
Have Supplied Buying Power Abroad

WASHINGTON, Dec. 4.—The post-war expansion of American trade has helped, not hindered, the recovery of Europe, it was pointed out in a joint annual report on general progress and tendencies in foreign trade made by Dr. Julius Klein, director, and E. Dana Durand, chief of the Division of Statistical Research, Bureau of Foreign and Domestic Commerce, Department of Commerce. Imports, it was declared, have grown more than exports and the immense increase in American purchases abroad has created a buying power in the supplying countries, both for American exports and for those of other industrial countries, that would not have otherwise existed. Moreover, it was stated, the growth of American exports has made possible large investments of American capital in foreign countries. European production was declared to have been stimulated by such investments in Europe itself, and markets for European goods in other continents have been stimulated by the greater buying power resulting from increased production brought by American investments in those continents.

"It is true, of course," it was stated, "that the United States has a larger share of world trade than before the war. This is a natural result of the growth of our productive capacity, but little checked by the war, while the productive capacity of Europe was enormously cut down. Our export trade has simply continued its normal growth, and even somewhat less rapidly than would have been the case had there been no war to reduce world-buying power. The concentration of all Europe's efforts on war needs brought its export capacity to a small fraction of its normal volume, and marked as has been the recent recovery it is but natural that European exports should still be less quantitatively than before the war."

Despite the growth of its factories, it was pointed out, the United States is importing more manufactured goods from Europe than ever before. The exports of the leading countries of Europe to the United States were declared to have increased much more, as compared with pre-war years, than their exports to the rest of the world. In the case of practically every non-European country, the report said, its exports to the United States have also grown far more as compared with pre-war years than its exports to all other countries combined. The buying power of this country resulting from its prosperity was said to have made up for the decline in demand resulting from the reduced buying power of Europe.

While declaring that the future of American export trade cannot, of course, be predicted with any certainty, the report pointed out that indications are strong that the tendencies of the last few years will continue "and that we shall witness further large expansion of our sales abroad, particularly of manufactured products, and further large increase of our imports." The report added that the most important point is that, so long as peace is maintained in the world, total world buying power tends to expand steadily. While competition in international commerce in manufactured goods was very vigorous prior to the World War, said the report, it did not prevent the expansion of the trade of every industrial country. At the same time that the United States and Germany, newer competitors in factory industry, were rapidly adding to their exportation of manufactured goods, it was pointed out, England, the pioneer in that field, was still expanding its sales abroad.

"Now that peace has come again the same factors which are building up productive capacity and raising living standards in the United States are again at work all over the world," it was declared.

Pig Iron Imports Above Last Year

WASHINGTON, Nov. 30.—Imports of pig iron into the United States continue to be comparatively small, having totaled only 14,108 tons in October. This, however, was an increase of 3671 tons over the figure for September. For the 10 months ended with October pig iron imports aggregated 118,885 tons, against 102,127 tons for the corresponding period of last year, an increase of 16,758 tons.

Great Britain was the leading source of these imports for both October and the 10 months of the present year, incoming shipments from that country having been 7702 tons

and 47,254 tons respectively. British India ranked second, supplying 4610 tons and 42,637 tons respectively.

Germany has sent no pig iron to the United States since July, when the movement from that country was 300 tons. The total incoming shipments from Germany for the 10 months ended with October was only 395 tons, erroneously stated as 95 tons previously. The action of the Treasury Department in revoking the anti-dumping order directed against German pig iron imports is not expected to have any appreciable effect on shipments from that country. Costs of making pig iron in Germany have risen to a point where, it is said, they are practically as great as those in the United States.

New York District Leads Airplane Industry

The Merchants' Association of New York, through its industrial bureau, has completed a survey of the airplane industry, and reports that the New York metropolitan district leads all other sections of the country in the manufacture of airplanes and accessories. In 1927, the companies in the New York district turned out 29 per cent of the total production of the country. Buffalo was second, Detroit third and Los Angeles fourth. Copies of the report will be available for distribution in about two weeks.

Ohio Power Plant Buys German Engines

HAMBURG, GERMANY, Nov. 17.—The Borsig G.m.b.H., Berlin, has confirmed the recent report that it has booked an order from the International Combustion Engineering Corporation, New York, for equipment to be installed in a power station at Lockland, Ohio. Included in the order are two vertical 6000-hp., direct acting, triple expansion steam engines, among the largest of their type.

Machinery Exports at High Level Again

October 32 Per Cent Above September and Ten-Months Total

13 Per Cent Ahead of 1927—Imports Much Heavier

WASHINGTON, Nov. 30.—Making a gain of \$10,166,206, exports of machinery of all kinds in October were valued at \$43,079,588, against \$32,913,382 in September. For the 10 months ended with October the value was \$408,403,112, an increase of \$47,119,012 over the value of \$361,284,100, representing exports for the corresponding period of last year. Exports of agricultural machinery and implements, totaling \$9,045,976 in October, compared with \$8,498,000 in September, were an important item in bringing the October shipments up to their high volume. For the 10 months ended with October exports of agricultural machinery and implements were valued at \$99,227,997, against \$78,355,545 for the corresponding period of 1927.

Exports of power-driven metal-working machinery in October were valued at \$2,491,284, against \$1,660,115 in September and \$1,913,131 in October of last year. For the 10 months ended with October, however, the value was \$15,661,121, compared with \$21,508,533 for the correspond-

ing period of last year, a decrease of almost \$6,000,000. Exports of industrial machinery in October made a striking rise to \$20,228,796, against \$14,872,197 in September (an increase of \$5,356,599) and \$16,728,138 in October of last year. For the 10 months ended with October the value was \$184,590,371, an increase of \$17,437,108 over \$167,153,262 for the corresponding period of last year. Exports of metal-working machinery, as shown in our table, totaled 670 units, valued at \$1,058,129 in October, compared with 553, valued at \$835,866, in September.

Imports of machinery and vehicles in October were valued at \$2,732,161, compared with \$2,226,391 in September and \$2,234,168 in October, 1927. For the 10 months ended October the value was \$23,926,913, against \$23,337,431 for the corresponding period of last year. Imports of industrial, office and printing machinery in October were valued at \$1,708,694, compared with \$1,428,520 in September and \$1,298,698 in October of last year. For the 10 months ended with

October they were valued at \$14,914,161, compared with \$13,996,093 for the corresponding period of 1927.

Imports of machinery as listed in THE IRON AGE table were valued at \$2,127,474 in October, against \$1,499,728 in September and \$1,495,195 in October of last year. For the 10 months ended with October the value was \$17,830,942, compared with \$16,683,823 for the corresponding period of last year. An outstanding feature of October imports was the incoming shipments of "other machinery," made up of industrial equipment largely. They rose to \$1,068,068, against \$780,238 in September and \$528,210 in October of last year; for the 10-month periods of 1928 and 1927 the values were \$8,339,058 and \$6,974,108 respectively.

Of the October imports, shipments to the value of \$474,744 came from Germany, of which New York received \$250,000. Other countries supplying this class of equipment in October were Sweden, \$188,277; United Kingdom, \$91,649; Canada, \$43,708; and Switzerland, \$43,425.

Machinery Markets and News of the Works

Buying Better Than Expected

November Machine Tool Business Did Not Slump
to Extent Usual at This Time of Year

NOVEMBER machine tool business was considerably better than the trade had expected. Sales by some companies were fully equal to those of either September or October, and a Cleveland manufacturer of turret lathes reports that its November volume was the largest for any month this year.

A recent statement by the National Machine Tool Builders' Association that November and December are normally months of reduced volume in machine tool buying finds contradiction this year, and the outlook is for a continued good demand during December, although the time is approaching for year-end inventories. The fact that industry generally is planning for a maintenance of present production schedules in the early part of 1929, and that machine tools ordered now cannot in many instances be delivered until February, account in part at least for orders which normally might be postponed until after Jan. 1.

One of the developments of the past week was a revival of buying by rail-

roads, which have been conspicuously light purchasers this year. The Norfolk & Western has ordered a number of the tools on the list it issued several weeks ago and will buy the remainder during the next week or two. The Southern is inquiring for six machines. The Louisville & Nashville is ordering for its 1929 program, for which a large appropriation has been authorized. The Chicago, Milwaukee, St. Paul & Pacific has ordered six tools and the New York Central has bought two engine lathes.

Detroit still figures prominently in machine tool demand. Further changes in models by companies in the low-priced class will probably result from the showing of the new Chevrolet six-cylinder car. A Detroit automobile company's inquiry for about \$500,000 worth of equipment for making crankshafts, mentioned a week ago, has not been acted upon.

The Whiting Corporation, Harvey, Ill., has issued an inquiry for 21 tools.

A European automobile manufacturer has purchased in this country 40 small and four crankshaft lathes.

New York

NEW YORK, Dec. 4.—Following the recent heavy purchasing by the Wright Aeronautical Corporation, Paterson, N. J., the machine tool market was not so active the past week as in the week before, but there was a good volume of business. For some sellers in this market November was one of the best months of a very good year. The International Motor Co. bought tools for its plants at Plainfield and New Brunswick, N. J., and the printing press firm of R. Hoe & Co., which has recently been a large buyer, continued to place orders for miscellaneous tools. The volume of business in prospect is still large enough to encourage the expectation that buying will not materially fall off in December, which is usually a month of reduced volume, because of the practice of many manufacturers to take inventory at the year end.

Some prospective buyers of tools, finding that deliveries on orders placed now are in many instances not to be had earlier than February, are expected to buy this month, when under other circumstances their purchases might be postponed until after Jan. 1. One instance of a sale of a machine tool with a penalty clause attached is reported; the seller is to pay \$25 a day forfeit for delivery later than Feb. 15, and the buyer will pay a like amount per day if the shipment is received before that date.

The Niles-Bement-Pond Co. has sold during the past week a 100-ton bushing press, 5000-lb. double-frame steam hammer, 36-in.-44-in. sidehead boring mill, two 4-spindle drum type milling machines, 44-in. heavy-duty boring mill, 6-ft. Morris radial drill, a Long & Allstatter punch and shear and other miscellaneous tools, while the Pratt & Whitney division included among its sales six 13-in. and four 16-in. lathes, three 7-in. bench lathes, three 14-in. vertical surface

grinders, two jig borers, two die sinkers and three thread milling machines.

Pioneer Instrument Co., Inc., 754 Lexington Avenue, Brooklyn, manufacturer of aircraft instruments, has asked bids on general contract for two-story addition and improvements in present factory to cost \$60,000. R. M. Segal, 475 Fifth Avenue, New York, is architect.

Streloff-Naughton Corporation, Long Island City, manufacturer of aluminum tanks, etc., has leased space in building at Harris Avenue and William Street, for new plant.

Garford Motor Truck Co., Thirteenth Avenue and William Street, Long Island City, with main plant at Lima, Ohio, is said to be planning early call for bids for two-story addition, 100 x 215 ft., to local factory branch, to cost about \$100,000 with equipment. Frank S. Parker, 119 West Fifty-seventh Street, New York, is architect and engineer.

Foote, Pierson & Co., 160 Duane Street, New York, manufacturers of electric signal devices, instruments, have leased two-story and basement factory at 73-77 Hudson Street, Newark, and will remove to new location and increase output.

J. C. Watson, 271 West 125th Street, New York, architect, has plans for a two-story automobile service, repair and garage building, 106 x 126 ft., to cost \$100,000 with equipment.

Department of Street Cleaning, Municipal Building, New York, has secured an appropriation of \$5,000,000 for construction of four incinerator and reduction plants, two in Manhattan and two in Bronx Boroughs, including furnaces, preheaters, flues, conveying machinery and other equipment. Alfred Taylor is street cleaning commissioner.

Lawton-Stephens Co., 427 Marcy Avenue, Brooklyn, manufacturer of sheet metal products, has awarded general contract to C. Salenger, 194 Freeman Street, for one-story plant to cost about \$30,000 with equipment.

Union High School District, Elmont, N. Y., plans installation of manual training equipment in new central high school at Floral Park to cost \$800,000, for which bids will be asked on general contract about middle of month. Knappe & Morris, 171 Madison Avenue, New York, are architects.

Empire State Ice Co., Ninth Avenue and 219th Street, New York, has filed plans for one-story ice-manufacturing plant, 100 x 150 ft., with refrigerating division, to cost about \$240,000 with machinery. Wigton-Abbott Corporation, 552 West Twenty-third Street, is engineer.

Lionel Corporation, 605 South Twenty-first Street, Irvington, N. J., manufacturer of electric toys, has awarded general contract to Austin Co., New York, for one and two-story addition, 390 x 620 ft., to cost over \$200,000 with equipment.

Klemm Co., Inc., Paramount Building, New York, organized a few months ago with capital of \$630,000 to manufacture

The Crane Market

NEW inquiry for overhead equipment continues small, but a number of orders for single cranes are expected to be placed before the end of the year. One builder of overhead cranes reports the sale recently of nine, consisting of a 100-ton, 71-ft. 6-in. span, 30-ton, 20-ft. 2-in. span, two 5-ton and one 3-ton, 32-ft. 8-in. span, two 15-ton, 76-ft. 6-in. span, a 20-ton, 23-ft. span and a 5-ton, 21-ft. 5-in. span. No improvement in locomotive crane business is reported, but further buying of power shovels has been made by contractors. Youngstown Sheet

& Tube Co., Youngstown, is taking bids on 11 cranes of various capacities for the new bar mills at its Indiana Harbor works.

Among recent purchases are:

Thomas Crimmins Contracting Co., 734 Lexington Avenue, New York, steam driven shovel from Bucyrus-Erie Corporation.

John H. Heald Co., Lynchburg, Va., 7½-ton crawl-tread crane from Browning Crane Co.

Joseph Corbiscello & Sons, Fairview, N. J., truck crane from Browning Crane Co.

Forment & Co., 150 Bank Street, New York, 2-ton special electric traveling crane from unnamed builder.

Apollo Steel Co., Apollo, Pa., a 10-ton, 69-ft. span crane from Northern Engineering Works.

Youngstown Sheet & Tube Co., a 10-ton, 35-ft. span crane from Shaw Crane Works.

aircraft, and occupying under temporary arrangement part of plant of Aeromarine Plane & Motor Co., Keyport, N. J., will purchase entire plant, comprising 230 acres and 21 buildings, with mile frontage on Raritan Bay, and will expand for monoplane parts and assembling. A stock issue will be sold to carry out development. Inglis M. Upperco, head of Upperco Cadillac Corporation, 70 Columbus Avenue, New York, automobiles, is president.

Board of Education, 31 Green Street, Newark, R. D. Argue, secretary, is asking bids until Dec. 12 for pumps and air compressor, supply cabinets, work benches, domestic science tables, hardware, iron and steel, gas plates, electrical supplies, etc.

Prest-O-Lite Co., Inc., 30 East Forty-second Street, New York, is considering rebuilding part of plant at Port Newark, Newark, destroyed by fire Nov. 23. Two of group of eight buildings were destroyed.

A. F. Strafer has purchased warehouse and machinery stock of Severin Strafer Machinery Corporation, Jersey City, and will conduct business as Strafer Machinery Co., with office and warehouse at Fourteenth and Provost Streets.

Reading Chain & Block Corporation, Reading, Pa., maker of material handling equipment, has removed New York office from 11 Park Place to 30 Church Street.

New England

BOSTON, Dec. 3.—Business in the local machine tool market the last week in November fell off. Activity centered largely in small used lathes, drilling tools and miscellaneous bench equipment. The lull is believed to be temporary, many users having signified their intentions of purchasing before the close of the year. November sales of dealers in general were well above those for October and were also larger than those for November, 1927.

With New England industries better employed than in months, machine tool houses look for good business during the first quarter of 1929.

Holland & Kenyon Machine Co., 56 North Street, Fitchburg, Mass., has completed plans for a one-story machine shop, 32 x 46 ft.

City of Cranston, R. I., has awarded a contract for a two-story and basement grammar school, 110 x 208 ft., to contain a manual training department. A. A. Rhodes is mayor. William R. Walker &

Son, 49 Weybosset Street, Providence, R. I., are architects.

Precision Electric Tool & Mfg. Co., production tools, dies and special equipment has located at 98 Union Street, Worcester, Mass. Company will also make an electric valve grinder. Tool department is under supervision of Arvid Fyrberg, and Edward Johnson is head of grinder department. J. Vistor Parent is general manager and treasurer.

Bids are being asked by Hart Mfg. Co., Hamilton Street, Hartford, Conn., manufacturer of electrical equipment and supplies, for one-story addition, 60 x 120 ft., to cost about \$40,000 with equipment. Mylchreest & Reynolds, 238 Palm Street, are architects and engineers.

Rhode Island Grinding & Mfg. Co., 263 Richmond Street, Providence, has awarded general contract to P. J. Flynn, 17 Exchange Street, for one-story addition, 50 x 55 ft.

Boston Elevated Railway Co., 31 St. James Avenue, Boston, has plans for one-story repair works, 85 x 150 ft., to include boiler house and automobile service units, to cost about \$100,000 with equipment.

Packard Motor Car Co., 1089 Commonwealth Avenue, Boston, has filed plans for addition to service, repair and sales building, including improvements in present plant, to cost \$400,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Harrington, Robinson & Co., 110 High Street, Boston, iron and steel products, have leased property totaling 21,200 sq. ft. of land, with one two-story building and two one-story shops, and will remodel for new storage and distributing plant.

Department of Public Works, City Hall, Providence, R. I., has completed plans for one-story equipment and repair shop to cost about \$70,000 with equipment. T. J. H. Pierce, City Hall, is city engineer.

Buffalo

BUFFALO, Dec. 3.—Harrison Radiator Corporation, Lockport, N. Y., manufacturer of automobile radiators, has plans for three-story addition, totaling 72,000 sq. ft. floor space, to cost \$130,000 with equipment.

Sherer-Gillett Co., Marshall, Mich., manufacturer of automatic refrigerators for butchers, grocers, etc., will discontinue operations at branch plant at Herkimer, N. Y., and will remove equipment to Marshall, where production will

be concentrated in future. Expansion will be carried out at latter plant.

Continental Can Co., Syracuse, N. Y., has purchased Bedford Can Co., Bedford, Va. New unit will work in close cooperation with plants of Wheeling Can Co., Wheeling, W. Va., recently taken over.

DuPont Rayon Co., River Road, Buffalo, has authorized construction of power plants at branch rayon mills in course of erection at Amphill, near Richmond, Va., and Waynesboro, Va., each to cost over \$100,000 with equipment.

Louis L. Babcock and Hugh McCruss, 610 Manufacturers' and Traders' Building, Buffalo, have organized United States Body & Forging Co. and plan early operation of plant to manufacture automobile radiators, fenders and kindred products.

Endicott Forging & Mfg. Co., Endicott, N. Y., has let contract to H. B. Van Ness, local contractor, for addition to die room, 25 x 116 ft., and addition to heat treating department, 40 x 80 ft. Company has also placed orders for two Tramrail cranes, 48 x 48-in. x 12-ft. planer, 48-in. boring mill, a 3000-lb. friction board drop hammer and a continuous heat treating and drawing furnace. S. J. Marshall is president.

Philadelphia

PHILADELPHIA, Dec. 3.—Philadelphia Storage Battery Co., Ontario and C Streets, Philadelphia, has taken over factory adjoining property, totaling more than 80,000 sq. ft. floor space, to manufacture radio sets. It is purposed to double present output of 2000 sets per day.

National Umbrella Frame Co., Belfield Avenue, near Penn Street, Philadelphia, has awarded general contract to Truscon Steel Co., 1505 Race Street, for two-story addition, 60 x 183 ft., to cost about \$50,000 with equipment.

Reliance Bronze & Aluminum Foundry Co., Philadelphia, recently organized by Alfred Haerberle, 268 West Fishers Avenue, and associates, plans early operation of local plant to manufacture aluminum, brass, bronze and other metal castings. Arthur W. Schuller, 7172 North Twentieth Street, is also interested in company.

A-Z Radiator Repair Co., Philadelphia, has leased three and four-story building at 1318 Ridge Avenue for new plant for automobile radiator manufacture and repairs.

Ajax Metal Co., 46 Richmond Street, Philadelphia, has awarded general contract to M. Ward Easby, 1505 Race

Street, for two-story addition, 52 x 60 ft., to cost about \$25,000 with equipment.

Hoffman Motors Co., Trenton, N. J., local representative for Durant and Moon automobiles, has begun work on two-story service, repair and sales building, 80 x 125 ft., and will install machine and repair shop on first floor, with parts department on second floor.

Board of Education, Glassboro, N. J., plans installation of manual training equipment in high school to cost about \$400,000, for which bids will soon be asked on general contract. Ritter & Shay, Packard Building, Philadelphia, are architects.

Borough Council, West Conshohocken, Pa., plans installation of electrically-operated pumping machinery and auxiliary equipment in extensions in sewage plant and system, to cost \$200,000. Canter, Edgar & Wittwer, 428 Market Street, Camden, N. J., are consulting engineers.

J. Munson Lee, Phillipsburg, N. J., and associates have organized Lee Metal Products Co., with capital of \$100,000, and will operate local plant to manufacture iron, steel, nickel and other metal goods. George H. Tay, Phillipsburg, will be an official of new company.

Board of Delaware County Commissioners, Court House, Media, Pa., is having plans drawn for central steam power plant in Snowden district, to cost more than \$75,000 with equipment. C. W. Brazer, Crozer Building, Chester, Pa., is architect.

Pennsylvania Forge Co., Philadelphia, maker of forgings, die blocks and forged steel pipe flanges, has removed its main office and manufacturing plant to larger quarters at Milnor and Bleigh Streets, Tacony, Philadelphia.

Blue Ridge Pipe & Nipple Co., Greenstone, Adams County, Pa., has started manufacture of black and galvanized pipe nipples in plant at above address. L. E. Beck and C. A. Wills are owners.

Barber-Colman Co., Rockford, Ill., has appointed W. M. Oplinger, 1023 Widener Building, Philadelphia, representative in Philadelphia territory for milling cutters and hobs, and Lloyd & Arms, Inc., 133 South Thirty-sixth Street, Philadelphia, representative for hobbing machines and hob sharpening machines.

Pittsburgh

PITTSBURGH, Dec. 3.—Sales of machine tools reached a good total last month, although not up to expectations based upon a brisk inquiry. Business the past week has been featured by the placing of a few tools on its fourth quarter list by the Westinghouse Electric & Mfg. Co. It is expected that some of the tools inquired for recently in a special list will be bought before the end of the month. The Carnegie Steel Co. has not completed tabulation of bids on its list of tools for its Duquesne works.

Fisher Scientific Co., 711 Forbes Street, Pittsburgh, manufacturer of scientific instruments, laboratory equipment and supplies, is having plans drawn for addition to cost about \$75,000 with equipment. M. Nirdlinger, Empire Building, is architect.

Metropolitan Paving Brick Co., Bessemer, Pa., is said to be planning early rebuilding of part of plant destroyed by fire Nov. 28. Machine shop, boiler plant,

conveying equipment and other buildings were burned. Headquarters are at Canton, Ohio.

Plant and business of Fry Equipment Corporation, Rochester, Pa., manufacturer of gasoline pumps, lubricating apparatus, etc., have been acquired by Wayne Pump Co., Fort Wayne, Ind. It is understood that Rochester works will be continued and output increased.

Duquesne Light Co., 435 Sixth Avenue, Pittsburgh, has awarded general contract to H. M. Bylesby Engineering & Management Co., 231 South La Salle Street, Chicago, for addition to steam-operated electric generating plant on Brunots Island, to cost about \$3,000,000 with equipment.

Mars Co., Oil City, Pa., subsidiary of United Natural Gas Co., plans rebuilding gasoline refinery at Hampton Station, about 10 miles from Oil City, destroyed by fire Nov. 23.

Pennsylvania Railroad Co., Philadelphia, has awarded general contract to Croseau Construction Co., Brownsville, Pa., for new engine house and locomotive repair shop, locker building, and other structures at Benwood, near Wheeling, W. Va., to cost about \$90,000 with equipment.

Turner Aircraft Corporation, Rochester, N. Y., represented by A. W. Legge, Bradford, Pa., has plans for one-story airplane plant at Bradford, including parts and assembling departments, to cost over \$35,000 with equipment.

Pittsburgh Foundry & Machine Co., foot of Thirty-sixth Street, Pittsburgh, is not planning additions to present plants or building operations of any kind, as stated in our issue of Nov. 22.

South Atlantic

BALTIMORE, Dec. 3.—Contract has been let by National Enameling & Stamping Co., 1901 Light Street, Baltimore, to Austin Co., Cleveland, for one-story addition, 90 x 168 ft., to cost about \$35,000 with equipment.

Crown Cork & Seal Co., Highlandtown, Baltimore, manufacturer of metal bottle caps, bottle-capping machinery, etc., is said to be arranging an expansion and improvement program to cost more than \$1,000,000. L. R. White, Hearst Tower Building, architect, is preparing plans for three new units.

Board of Education, Savannah, Ga., is said to be planning installation of manual training equipment in two-story and basement high school to cost about \$275,000, for which plans have been completed. Wallin & Comer, Realty Building, are architects.

Bureau of Street Cleaning, Municipal Office Building, Baltimore, is considering one-story equipment and repair shop at 1139 Granby Street, with automobile service and repair department for motor trucks, etc., to cost about \$100,000 with equipment.

Nu-Idea Desk Co., Darlington, S. C., manufacturer of school desks, etc., has plans for new one-story plant at Sumter, S. C., with main unit of 20,000 sq. ft. floor space, and smaller buildings, to cost more than \$75,000 with machinery. Present plant will be removed to new location.

Potomac Electric Power Co., Washington, is carrying out expansion and improvement program at local Benning steam-operated electric generating plant, to include installation of 30,000-kw. gen-

erator and auxiliary equipment. Entire project will cost over \$2,600,000.

Carolina Paper Co., Charlotte, N. C., is planning one-story storage and distributing plant, 100 x 300 ft., to cost over \$50,000 with equipment.

Wilmington Naval Stores Co., Wilmington, N. C., D. J. Herring, head, has begun construction of new plant near Wilmington, for production of turpentine, rosin and kindred products, to cost over \$80,000 with equipment.

Common Council, Sanford, N. C., has approved plans for municipal airport, including hangar, repair shop and other units.

East Coast Utilities Co., Richmond, Va., operating electric light and power, and ice-manufacturing plants in Virginia, Maryland and North Carolina, has arranged for bond issue of \$1,000,000, portion of proceeds to be used for extensions and improvements in properties.

Cutler-Hammer Mfg. Co., Milwaukee, maker of electrical control apparatus, has removed its Atlanta, Ga., office to larger quarters at 150 Peters Street, Southwest. In addition to sales and engineering service on motor control apparatus and wiring devices, warehouse is maintained where many products will be carried in stock for immediate shipment. A. C. Gibson is in charge.

William Steele & Sons Co., Fifteenth and Cherry Streets, Philadelphia, engineer and contractor, is preparing plans for new textile mill at Pulaski, Va., for Virginia Maid Hosiery Mills, to include machine shop, power house and other units in addition to main mill, to cost about \$200,000 with machinery.

Barber-Colman Co., Rockford, Ill., has appointed J. R. Walraven, Forsythe Building, Atlanta, Ga., representative in Georgia for hobbing machines, hob sharpening machines, milling cutters and hobs.

Detroit

DETROIT, Dec. 3.—Auto-Rad Electrical Corporation, Adrian, Mich., manufacturer of radio receiving sets, is arranging for additional space for increased output in factory now occupied in part.

Crane Co., 836 South Michigan Avenue, Chicago, is having plans drawn for one-story factory branch and distributing plant at Flint, Mich., with pipe-cutting and threading department, etc., to cost about \$45,000 with equipment. George Bachman, Pengelly Building, Flint, is supervising architect.

Upton Machine Co., Edgewater Street, St. Joseph, Mich., manufacturer of electric washing machines and parts, has plans for one-story unit, 100 x 250 ft., to cost about \$85,000 with equipment.

Hayes Body Corporation, Ionia, Mich., is carrying out an expansion and improvement program to cost about \$450,000. Approximately one-half of this sum will be used for extensions at local body-building plant and other half for enlargement of metal stamping plant at Grand Rapids, Mich.

Stout Metal Airplane Division of Ford Motor Co., Dearborn, Mich., is said to be planning one-story addition, to cost over \$75,000 with equipment.

General Foundry & Machine Co., Flint, Mich., is expanding its plant at Marshall, Mich., including installation of additional equipment.

American Forging & Socket Co., Pontiac, Mich., has plans for two additions,

one and two stories, 55 x 80 ft., and 100 x 120 ft., to cost over \$80,000 with equipment. Wright & Nice, General Motors Building, Detroit, are architects.

Reynolds Spring Co., Jackson, Mich., has purchased plant and business of National Appliance Co., Inc., Linden, Mich., manufacturer of interior and exterior flood lighting equipment. Equipment will be removed to Jackson where branch will be established for production of National company specialties. J. L. Brownell, formerly president of last-noted company, will continue as vice-president in charge of engineering.

Air Reduction Sales Co., 342 Madison Avenue, New York, manufacturer of acetylene welding apparatus, etc., has filed plans for one-story factory branch and distributing plant at Flint, Mich., to cost about \$35,000 with equipment.

Detroit Edison Co., 2000 Second Avenue, Detroit, has plans for new power substation and outdoor switching plant at Bunce Creek, Port Huron, Mich., to cost about \$300,000 with equipment.

Kirk & Blum Mfg. Co., Cincinnati, maker of shavings and dust collecting systems, ventilating, drying and air conditioning equipment, industrial ovens and sheet metal products, is opening a branch factory with sales and engineering office at 4718 Burlingame Street, Detroit. Present district office in General Motors Building will be removed to new address.

Huron Forge & Machine Co., 9041 Alpine Avenue, Detroit, manufacturer of drop forgings, has started construction of a one-story addition to provide for larger output.

Cleveland

CLEVELAND, Dec. 3.—Machine tool business is holding up well and while inquiry slowed down somewhat during the week it is exceedingly good for this season of the year, as December is usually a rather quiet month. A local builder of turret lathes reports that November was the best month of the year in the volume of sales. Business is well distributed, a larger percentage coming from fields outside of the automotive industry than recently. The Curtiss Aeroplane & Motor Corporation, Buffalo, which has been buying small lots of machinery, has a number of tools yet to be placed.

Sales during the week included a 24-in. and a 16-in. lathe to Erie Foundry Co., Erie, Pa.; 13-in. lathe to Pittsburgh Plate Glass Co. for its Columbia division, Barberton, Ohio; jig borer to Radiator Engineering Co., Toledo, and a used 90-in. boring mill to Wheeling & Lake Erie Railroad. This railroad is still in the market for a wheel press and punching machine.

Lamson & Sessions Co., 1971 West Eighty-fifth Street, Cleveland, manufacturer of bolts, nuts, etc., is having plans drawn for four-story addition, including improvements in present plant, to cost more than \$100,000. George S. Rider Co., Century Building, is architect and engineer.

Ohio Cut Stone Co., South Amherst, Ohio, is planning to rebuild part of plant destroyed by fire Nov. 26.

Canton Drop Forge Co., Canton, Ohio, is completing plans for one-story plant, 70 x 320 ft., to cost about \$90,000 with equipment.

Edward Ford Plate Glass Co., Rossford, Ohio, is said to be planning additions, including main glass-making unit,

grinding and polishing plant, and storage and distributing plant, to cost more than \$2,000,000 with machinery.

Indian Lake Motor Boat Co., Lima, which recently changed name to Dart Boats, Inc., has plans for new one-story boat-building and repair plant, 65 x 300 ft., at Toledo, Ohio, to cost more than \$75,000 with equipment.

Brown Fence & Wire Co., 6532 Juniata Avenue, Cleveland, recently formed to take over company of same name has arranged for stock issue to total \$6,187,500, a portion of proceeds to be used for expansion. Company also operates Peerless Wire & Fence Co., with plants at Adrian, Mich., and Memphis, Tenn. Frank Spitz is president.

Cincinnati

CINCINNATI, Dec. 3.—From the standpoint of sales November turned out to be comparable with September and October for local machine tool builders. While some companies report that bookings slumped somewhat in the past 30 days, others showed a gain sufficient to keep the average at the high level of recent months. Pending business is of large volume and indications are that buying will continue heavy well into next year. Some manufacturers have quoted lately on as much as \$150,000 worth of equipment and inquiries among the trade reveal the fact that many users are planning to replace obsolete equipment in the next few months.

Outstanding in the past week's transactions was an order for several lathes placed with a local builder by a European automobile maker. An Eastern airplane motor company has bought a large amount of equipment from Cincinnati machine tool plants and is expected to make further purchases soon. A revival of buying on the part of railroads is noted. The Norfolk & Western has contracted for a number of tools on its recent list and will order the remainder during the next week or two. Southern Railway is inquiring for about six machines, while the Louisville & Nashville has begun purchasing tools on its 1929 program, for which an appropriation has been authorized. The New York Central bought two large engine lathes the past week.

Detroit still is figuring conspicuously in machine tool activities. Purchases by automobile manufacturers continue impressive. A large Detroit company is reported not yet to have acted on its inquiry for about \$500,000 worth of equipment.

C. O. Sherrill, city manager, Cincinnati, will take bids at once for hangar with repair facilities at municipal airport, 112 x 114 ft., to cost about \$50,000. Robert M. Olin, city service director, is in charge.

Crowe Mfg. Corporation, 317 Sycamore Street, Cincinnati, manufacturer of electric-operated safety saws and other equipment, has arranged for stock issue to total \$587,500, part of proceeds to be used for expansion in manufacturing.

Charles Hock, Realty Building, Dayton, Ohio, architect, has plans for multi-story automobile service, repair and garage building to cost \$150,000 with equipment.

Union Utilities, Inc., 46 Cedar Street, New York, operating Memphis Natural Gas Co., Memphis, Tenn., is considering construction of pipe line for natural gas supply to Nashville, Tenn., and vicinity, about 200 miles from supply base, to cost

more than \$5,000,000. Company has recently begun building line from Monroe, La., to Memphis, to cost close to like sum.

Board of Education, Hamilton, Ohio, has authorized installation of manual training department in new three-story high school to cost about \$400,000, for which bids are being asked on general contract until Dec. 13. F. J. Muller Rentschler Building, is architect.

American Glanzstoff Corporation, Elizabethton, Tenn., plans extensions in power house, machine shop and other departments in connection with new unit at local rayon mill to cost more than \$4,000,000. Headquarters are at 180 Madison Avenue, New York.

Louisville Frog, Switch & Signal Co., Louisville, has been organized to take over and consolidate Louisville Frog & Switch Co., and Southern Signal Co., both with local plants, last noted specializing in production of castings as well as signal equipment. It is purposed to continue both plants in operation.

Oakley Pattern & Foundry Co., 4423 Verne Avenue, Cincinnati, has awarded general contract to Erwin Hoinke for an addition, 43 x 80 ft., which will increase manufacturing space 70 per cent.

Ohio Power Co., Newark, Ohio, plans construction of steel tower transmission line from generating plant at Philo to Fostoria, Ohio, and vicinity, about 125 miles with power substation and switching plant at last noted place, to cost more than \$850,000. Company will also build similar transmission line from Philo station to South Bend, Ind., and vicinity.

Chicago

CHICAGO, Dec. 3.—The local machine tool market remains moderately active, with sales and inquiry from widely scattered sources. The list issued several weeks ago for the Fort Wayne works of the International Harvester Co. is still open. Of special interest among new inquiries is a list of 21 tools for the Whiting Corporation, Harvey, Ill. The Chicago, Milwaukee, St. Paul & Pacific has ordered six tools for delivery to points along its lines. Miscellaneous orders for punch presses and ball-bearing drills are noteworthy. Used machine tools are moving freely in a market that is more liberally supplied than of late.

Following the announcement a week ago that several builders had advanced prices are reports that a number of lines may be advanced about Jan. 1.

Des Moines Steel Tank Co., 1819 East Court Avenue, Des Moines, Iowa, is having plans prepared for a warehouse and an addition to its factory.

Raffel Mfg. Co., 4443 Armitage Avenue, Chicago, manufacturer of radio parts, will build a factory at 4528 Fullerton Avenue, to cost \$50,000.

Industrial Steel & Supply Co., Chicago, has removed its offices to 1964 Building, 228 North La Salle Street.

Monarch Tractor Corporation, Springfield, Ill., subsidiary of Allis-Chalmers Mfg. Co., West Allis, Wis., has asked bids on general contract for two one-story plant units, 100 x 200 ft., and 80 x 250 ft., to cost over \$200,000 with equipment.

Federal Sign Co., 1215 Nicollet Avenue, Minneapolis, Minn., manufacturer of electric displays, has awarded general contract to M. Schumacher, 104 South Ninth

Street, for two-story plant to cost \$35,000 with equipment. Larson & McLaren, Baker Building, are architects.

Raffel Mfg. Co., 4443 Armitage Avenue, Chicago, manufacturer of radio equipment and parts, has acquired property, 100 x 135 ft., at 4528 Fullerton Avenue for new plant to cost approximately \$50,000 with machinery and will remove to new location.

Western Screw Mfg. Co., 4413 Kinzie Street, Chicago, has awarded general contract to A. Larson, 19 South La Salle Street, for one-story addition, 25 x 100 ft. Ralph H. Oliver, 115 South Dearborn Street, is architect.

Grau-Curtis Co., 613 First Avenue, N. E., Minneapolis, Minn., manufacturer of furniture, will take bids at once for two-story factory, 137 x 145 ft., to cost about \$100,000 with equipment. Lang, Raugland & Lewis, Essex Building, are architects.

Velle Motor Corporation, Moline, Ill., is arranging to discontinue manufacture of automobiles, and will devote local plant to production of airplanes, largely of monoplane type.

Midway Chevrolet Co., 1641 University Avenue, St. Paul, Minn., local representative for Chevrolet automobile, has plans for one-story service, repair and sales building, 120 x 125 ft., to cost about \$100,000 with equipment. P. E. Crosier, New York Life Building, Minneapolis, Minn., is architect.

Gulf States

BIRMINGHAM, Dec. 3.—City Council, Austin, Tex., is planning extensions and improvements in municipal electric light and power plant, to cost more than \$350,000 with equipment. United Engineers & Constructors, Inc., Grand Avenue and Lincoln Highway, Philadelphia, is engineer.

Universal Car Loading & Distributing Co., Mercantile Bank Building, Dallas, Tex., is planning new storage and distributing plant, primarily for handling automobiles, including loading docks, about 400 ft. long. An electric traveling crane will be installed. Project will cost more than \$100,000.

United Gas Co., operating Houston Gulf Gas Co., Houston, Tex., and other natural gas properties, is planning an expansion and improvement program, including construction of about 1000 miles of pipe lines, increase in producing properties and purchase of Duval Texas Sulphur Co. A stock issue of \$3,000,000 is being sold, part of fund to be used for development.

War Department, Washington, has authorized improvements at flying field at Galveston, Tex., including fund of \$19,369 for extensions in machine shops.

Wilton Dubus and Frank Atwood, Crowley, La., have purchased controlling interest in Acadia Iron Works, with local plant, heretofore held by J. T. Hinchliffe. New owners plan expansion. Company name will be changed to Dubus & Atwood.

Williams Auto Top Co., Dallas, Tex., is arranging for early occupancy of new factory, one story, 65 x 200 ft., now in course of construction, which has been secured under lease.

Roxana Petroleum Co., City National Bank Building, San Antonio, Tex., is completing plans for construction of new oil refinery near Houston, Tex., to cost more than \$500,000 with equipment. Company will also construct 450-mile pipe line to refinery for crude oil supply.

C. B. Schoepl, Florida Theater Building, Jacksonville, Fla., architect, has plans for three-story automobile service, repair and garage building, 100 x 125 ft., to cost about \$100,000 with equipment.

Prest-O-Lite Co., 6119 Harrisburg Road, Houston, Tex., has awarded general contract to Donald Hall, Cotton Exchange Building, for two buildings, for factory branch, storage and distributing service, to cost \$40,000. Headquarters are at 30 East Forty-second Street, New York.

Humble Oil & Refining Co., Houston, Tex., has begun foundations for new gasoline refinery at Ingleside, Tex., to cost more than \$850,000 with machinery. Company is reported planning new oil refinery near Neches, Tex., where 15-acre tract recently was secured. Humble Pipe Line Co., a subsidiary, will proceed with installation of three-unit pumping station near Sweetwater, Tex., to cost about \$140,000, for booster service for pipe line to Hawley, Tex.

Barber-Colman Co., Rockford, Ill., has appointed Rosenfelder Machinery Co., 1024 Post Dispatch Building, Houston, Tex., representative in that territory for hobbing machines, hob sharpening machines, hobs and milling cutters.

St. Louis

ST. LOUIS, Dec. 3.—Contract has been let by United Cold Storage Co., 2101 West Pershing Road, Chicago, to E. W. Sproul Construction Co., 310 South Michigan Boulevard, for eight-story addition to ice-manufacturing and cold storage plant at Kansas City, Mo., to cost about \$900,000 with equipment.

Phillips Petroleum Co., Bartlesville, Okla., has authorized construction of new gasoline refinery in Noodle Creek district, Tex., to cost about \$70,000 with equipment.

Kansas City Power & Light Co., Fourteenth Street and Grand Avenue, Kansas City, Mo., has awarded general contract to Fleming-Gilchrist Construction Co., 3525 Broadway, for four-story automobile service, repair and garage building, 125 x 140 ft., to cost over \$175,000.

Cessna Aircraft Co., Wichita, Kan., has arranged for stock issue to total \$131,250, part of proceeds to be used for expansion in output.

N. S. Sherman Machine & Iron Works, 18 East Main Street, Oklahoma City, Okla., has awarded general contract to H. W. Underhill Construction Co., Braniff Building, for one-story addition, 50 x 140 ft., to cost about \$35,000.

Sinclair Refining Co., 1921 Harrison Street, Kansas City, Mo., is said to be planning new oil storage and distributing plant at Nebraska City, Neb., to cost about \$100,000 with equipment.

Seaman-Dunning Corporation, West Fourth Street, Pine Bluff, Ark., affiliated with Nash Motors Co., Kenosha, Wis., has plans for third unit at local plant, one story, 215 x 280 ft., to manufacture bodies for Nash automobiles, to cost more than \$160,000 with equipment.

Bradford Armature Works, 315 East Broadway, East St. Louis, Ill., has asked bids on general contract for one-story and basement plant, 50 x 71 ft., to cost more than \$26,000 with equipment. Seer-Ka Engineering Co., 1732 North Twenty-fifth Street, is engineer.

Coffman Aircraft Co., Oklahoma City, Okla., has begun construction of one-story airplane plant, 60 x 120 ft., to in-

clude parts manufacture and assembling, to cost about \$35,000.

Wilcox Oil & Gas Co., Bristow, Okla., John J. Kerins, manager, has plans for new oil refinery, to cost over \$100,000 with equipment.

Standard Steel Works, North Kansas City, Mo., has been organized to manufacture oil storage tanks, dump bodies for trucks, grain blowers, airplanes, heating and ventilating equipment and other fabricated sheet steel products. Company also has engineering service for working out details of special mill and elevator jobs, smelters, zinc plants, etc.

Indiana

INDIANAPOLIS, Dec. 3.—Contract has been let by Auburn Automobile Co., Auburn, Ind., to Austin Co., Cleveland, for additional units at Connersville plant, to cost over \$300,000 with equipment.

Chevrolet Aviation Motors Corporation, Tenth and Fayette Streets, Indianapolis, an interest of Chevrolet Brothers Mfg. Co., manufacturer of automobile motor equipment, is said to be planning one-story unit to cost over \$40,000.

Schwitzer-Cummins Co., 1125 Massachusetts Avenue, Indianapolis, manufacturer of mechanical fans for automobiles and tractors, has filed plans for one-story addition, 125 x 145 ft., to cost about \$45,000 with equipment.

Chambers Mfg. Co., Shelbyville, manufacturer of fireless cookers, etc., has awarded general contract to Harry O. Phares, Shelbyville, for two-story and basement addition to cost \$35,000.

Common Council, Washington, Ind., is planning establishment of municipal airport, including hangar, repair shop and other buildings.

Columbia Canning Co., Cambria, Wis., is planning new plant at Shelbyville, including power house and machine shop, to cost \$115,000 with equipment. Shelbyville Better Business Club is interested in project.

Peerless Foundry Co., 1843 Ludlow Street, Indianapolis, has filed plans for one-story addition, to cost about \$25,000 with equipment.

R. & R. Mfg. Co., Anderson, maker of overhead valve equipment for motor cars, will remove plant and offices to new quarters at Madison and Nichol Avenues.

Diamond Separator Co., Franklin, Ind., is reported planning one-story addition to cost over \$30,000 with equipment.

Fibroc Insulating Co., Valparaiso, L. T. Frederick, president, has engaged Lockhart & Fett, Associates Building, South Bend, architects, to prepare plans for one-story plant, 110 x 350 ft., with power house, to cost \$100,000 with equipment.

Pacific Coast

SAN FRANCISCO, Nov. 28.—Contract has been let by Water Works Supply Co., Oakland, Cal., manufacturer of power and mechanical equipment, to H. J. Christiansen, Ray Building, for two-story plant, 50 x 76 ft. A. Froberg, 505 Seventeenth Street, is architect.

Board of Education, Los Angeles, Architectural Division, has plans for new high school group on Santa Barbara Avenue, to cost about \$350,000, to include one-story vocational shop. Bids will be asked on general contract early in January.

Lake Airways, Inc., Lakeport, Cal., recently organized by H. W. Hughson and associates, has secured lease from City Council for establishment of airport, to include hangar, repair shop and other units, to cost about \$50,000.

Richfield Oil Co., Bartlett Building, Los Angeles, is planning for airport near properties at Merced, Cal., including six-plane hangar, repair shop and other structures, to cost in excess of \$90,000.

Linde Air Products Co., 351 Everett Street, Portland, with headquarters at 30 East Forty-second Street, New York, is planning two new manufacturing and distributing plants, to cost more than \$150,000 with equipment.

Isaacson Iron Works, 2917 East Marginal Way, Seattle, manufacturer of automobile bodies and other metal products, is planning extensions to cost more than \$90,000 with equipment.

Puget Sound Power & Light Co., Seattle, is arranging an expansion program to cost more than \$10,000,000, and about three times that sum within the next three to four years. Present work will include new steam-operated electric power plant to cost over \$3,500,000 with transmission lines. Company is under direction of Engineers Public Service Co., an interest of Stone & Webster, Inc., 49 Federal Street, Boston.

Scenic Airway, Inc., Phoenix, Ariz., Parker Van Zandt, general manager, is planning construction of local airport, to include hangars, repair shops and other buildings, to cost \$140,000.

Ace Heating & Ventilating Co., 5805 Angeles Mesa Drive, Los Angeles, has been organized to design and manufacture heating, ventilating and refrigeration equipment, specializing in theater, auditorium, school and assembly halls. Company does not maintain manufacturing facilities at present, but expects to arrange for this later. Equipment manufactured for its use is handled on jobbing basis.

Broderick & Bascom Wire Rope Co., St. Louis, will erect a new building, 100 x 100 ft., at Eighteenth and Upshur Streets, Portland, Ore., to take care of its Pacific Coast trade.

Byron Jackson Pump Co., Berkeley, Cal., has established a direct factory branch at 1104 Buyers Building, Portland, in charge of A. P. DuMond. Associated with him is A. H. Marshall, consulting engineer.

Wagner Electric Corporation, 6400 Plymouth Avenue, St. Louis, has removed its Los Angeles branch office and service station to larger quarters at 1220 Hope Street.

Milwaukee

MILWAUKEE, Dec. 3.—Following an excellent run of business in November, which sets the month apart as probably the best the local machine tool industry has experienced since the war, December has opened with bright prospects and the character and volume of inquiry denote a continuance of active demand. In some instances tool builders are falling farther behind in deliveries, despite efforts to keep production abreast of shipping specifications.

Allis-Chalmers Mfg. Co., Milwaukee, has placed contract with W. W. Oeflein, Inc., 110 East Wisconsin Avenue, for a brick and steel foundry, 144 x 130 ft., and a new heat treating shop 50 x 120 ft., as extensions of tractor plant at main

works in West Allis. Estimates also have been closed on a manufacturing building, 200 x 600 ft., for this division. Extensions will also be made to Monarch tractor plant at Springfield, Ill. Purchase of equipment has been under way for some time.

Hackendahl & Schmidt Co., Milwaukee, fabricator of structural and architectural iron, will begin work this month on erection of a one-story storage building, 100 x 240 ft. It will have a 60-ft. craneway and two 20-ft. lean-tos.

J. I. Case Threshing Machine Co., 700 State Street, Racine, Wis., is taking bids through Frank J. Hoffman, architect, James Block, Racine, for an extension of about 10,000 sq. ft. to its branch plant at Lincoln, Neb. Investment in building and equipment will be about \$35,000.

In addition to extensions to heat treating shop, power plant and other enlargements by Nash Motors Co., Kenosha, Wis., to its branch works at Racine, Wis., contracts have been placed for a new shear building, 28 x 41 ft. About \$600,000 is being expended for structures and equipment.

Board of Vocational Education, La Crosse, Wis., has been granted a 1929 budget appropriation of \$52,500 for completion of second story of present building and purchase of equipment. Work is expected to materialize about Feb. 1. G. M. Wiley is secretary of board.

Board of Industrial Education, Racine, Wis., has been authorized an appropriation of \$40,630 for new construction and equipment for Racine Vocational School, available Jan. 1.

Milwaukee Corrugating Co., Milwaukee, has acquired Eller Mfg. Co., Canton, Ohio, which operates a plant 280 x 300 ft. Consolidation will serve as a production and distributing section for Milwaukee company in East and South. Line of products will now include metal lath, corner bead, channels, ceilings, stove pipe, furnace pipe and other types of conductor pipe, and furnace and stove pipe elbows.

Canada

TORONTO, Dec. 3.—Machine tool sales continue in good volume. Reports indicate that November business compared favorably with any former month this year. Inquiries are coming in steadily and dealers and builders are optimistic regarding the future.

Kilgour Chair Co., Ltd., Coaticook, Que., has awarded several contracts for erection of a plant to cost \$80,000. Buildings will be one story, 80 x 400 ft.; 20 x 50 ft., and 56 x 109 ft. The Stewart Construction Co., Ltd., 12 Wellington Street North, Sherbrooke, Que., is contractor.

Canadian Drawn Steel Co., Ltd., Gerard Street, Hamilton, Ont., has awarded general contract to Frid Construction Co., Ltd., 6 Hughson Street North, for an addition to cost \$25,000.

A number of sub-trades have been let for a \$200,000 plant and office building at New Toronto, Ont., for Ritchie Cut Stone Co., Ltd.

Cunningham & Son, Ltd., St. Paul Street, St. Catharines, Ont., manufacturer of castings, will make alterations and additions to plant, and has awarded general contract to P. Teatero & Son, 112 Louisa Street.

Walbridge Aldinger Co., 2306 Penobscot Bldg., Detroit, has been awarded contract for superstructure of \$1,500,000 addition to plant of Chrysler Motor Co., Walker-

ville, Ont., building to be three stories, 380 x 1000 ft. Hutton & Souter, 6 James Street North, Hamilton, Ont., are architects.

S. E. Dinsmore Co., Ltd., Security Building, Windsor, Ont., has been awarded contract for a \$60,000 addition to plant of Auto Specialties Mfg. Co. of Canada, Ltd., Windsor, Ont.

Tenders will be called soon for a 2,000,000-bu. addition to grain elevator of Midland Simcoe Elevator Co., Ltd., Midland, Ont., to cost about \$500,000. C. D. Howe & Co., 712 Whalen Building, Port Arthur, Ont., are architects.

National Utilities Corporation, Winnipeg, Man., purposes to build plants at Port Arthur and Fort William, Ont., to manufacture gas and heating units. Each plant will cost about \$750,000.

Western Canada

Western Steel Products, Ltd., Edmonton, Alta., will build a one story addition, 80 x 190 ft., to cost \$50,000.

John Deere Plow Co., head office, Moline, Ill., is having plans prepared for a warehouse and service plant at Swift Current, Sask., tenders for construction to be called next spring.

Foreign

AN expansion and development program in Brazil will be carried out by Electric Bond & Share Co., 2 Rector Street, New York, through its subsidiary, American & Foreign Power Corporation, to cost over \$20,000,000, including purchase of properties, extensions in power plants, transmission lines and other facilities. Company has recently acquired Pernambuco Tramway Co., Pernambuco, and Tramway, Light & Power Co. of Natal, State of Rio Grande del Norte, Brazil.

Goodyear Tire & Rubber Co., Akron, Ohio, has begun construction of new unit at plant at Sydney, Australia, to cost more than \$300,000 including equipment.

Ministry of Public Works, Prague, Czechoslovakia, has plans for construction of power dam at Vranov, on River Dyje, in Moravia, to cost about 87,000,000 crowns (\$2,558,823), providing water head for hydroelectric power station, to be built at same time to cost approximately 25,000,000 crowns (about \$735,300).

Ford Motor Co., Detroit, has concluded agreement with Turkish Government, Constantinople, for establishment of assembling plant in that country. It is purposed to take over existing property for initial works and later to construct entirely new plant. It will be used as export base for Near East for passenger cars, trucks, tractors and aircraft.

Soviet Russian Government, Petrograd, is planning construction of factory to manufacture watches and clocks, including mechanisms, cases, etc. A delegation has left to visit such plants in western Europe and will arrange for details of project. Amtorg Trading Corporation, 165 Broadway, New York, is official buying agency for Soviet Government in United States.

A company is being organized at Trinidad, British West Indies, to construct an artificial gas plant and system for Island of Trinidad. It is expected that there will be selection of American gas works machinery for project. Information at office of Bureau of Foreign and Domestic Commerce, reference Trinidad No. 293026.

THE IRON AGE

New York, December 13, 1928

ESTABLISHED 1855

VOL. 122, No. 24

Business Forecasts Put to Practical Use

Telephone Company Applies General Industrial Curve and Supplementary Data to Manufacturing, Line Extension and Toll Service Needs

BUSINESS forecasting may be an inexact science, if it is a science at all, but in the opinion of the statisticians of the American Telephone & Telegraph Co. it is a valuable aid to the making of future business plans, whether it be used by a telephone system, a manufacturer whose distribution is country-wide or one whose trade is confined to certain sections.

Whatever the defects of business forecasting may be, the American Telephone & Telegraph Co. has employed it since 1921, not only for charting the probable course of telephone traffic over long-distance lines, but to determine the needs for new plant and equipment caused by shifting tides in business or increases in population or general industrial expansion.

When a skyscraper rises in New York requiring several thousand new telephones, that is a matter for the local telephone company to solve, but when the Ford Motor Co. in Detroit resumed production after months of comparative idleness, there was an increase in long-distance traffic which had to be foreseen and provided for by the parent company.

Keeps Close Track of Business Developments

The curves of telephone traffic and general business conditions bear a fairly definite relation to each other, but in the opinion of the officials of the American Telephone & Telegraph Co. telephone traffic is not sufficiently sensitive to be regarded as a definite barometer of business. On the other hand, the business trend has a very definite effect on telephone traffic.

Therefore, the telephone system finds it necessary to

THE Curves of Telephone Traffic and General Business Conditions in the Country Bear a Fairly Definite Relation to Each Other. The American Telephone & Telegraph Co. applies its general business curve, together with supplementary information, to various telephone circuits, forecasting with reasonable accuracy the probable traffic over a given circuit. In the same manner its forecasts are applied to its manufacturing department and to line and plant extensions. The curve reproduced was made in the spring of 1925, and it was borne out fairly well by events.

keep very close to business developments, not only on broad general principles, but as they affect certain industries and certain sections of the country. For example, a boll weevil blight in the cotton growing sections of the South will have a decidedly unfavorable effect on telephone communication in that section. In cotton centers the traffic rises to a high point during the fall and winter, when cotton is being sold and shipped. A stiffening of rubber prices is bound to boost traffic on circuits to Akron, Ohio. Likewise, changes in the lead market quickly affect business over lines to Joplin, Mo.

The coal fields furnish examples of such transient developments. During the coal strike of 1922 there was sudden jump in traffic to points in the non-union fields, where mines were still operating, and a corresponding drop in traffic to the union fields. By the time the strike ended the shortage of coal had become acute, and for some weeks wires to both union and non-union fields were humming. When this condition in the coal supply had been remedied, the traffic fell to normal, in some cases nearly two years after the strike began.

In estimating the volume of telephone traffic, the telephone company gives consideration to three major elements: Past experience, economic factors and common sense. These elements enter into each decision in a varying degree. Not that the forecaster shows varying degrees of common sense from day to day, but in each case common sense dictates that a different weight be given to each factor.

Under ordinary circumstances, past experience has been found by the telephone company's forecasters to be a rea-

sonably reliable basis for prediction over a short period. It shows the seasonal variation and the normal growth of the traffic. The forecasting for long-distance service (which comes closest to the problem of the average manufacturer in shaping his policies) covers a period of one year, five years or greater periods, depending upon the use to which the forecasts are to be applied. The curve is projected into the period for which a prediction is desired. Suitable corrections are made for any factors which may conceivably influence telephone traffic. General business conditions throughout the country and in particular areas are taken into consideration.

Steel and Pig Iron Production Given Considerable Weight

Various business data are used by the statisticians of the telephone company. Steel ingot and pig iron production is given considerable weight, as are machine tool orders, car loadings, electric power consumption and such important indices of business trends.

Each autumn the associated operating companies of the Bell system draw up a detailed budget for the year just ahead and a somewhat less detailed but comprehensive forecast for the four succeeding years. In other words, a tentative five-year program is laid down, subject to annual revision. The budget for the year just ahead takes account not only of expected operating revenues and expenses, but also of capital needs, and goes into much detail in regard also to physical units of plant.

One of the earliest formal steps taken each year in carrying out the budget plan is the submission to executives of the Bell system of certain economic forecasts, of which the most fundamental is the forecast of general business. Each month the executives of the system receive from the statistical department a summary of business conditions, which not only reviews economic events and developments, but indicates the views of the statisticians as to the immediate future of general business. The annual forecast takes the form of a graphic projection of the general business curve. This curve, it is stated, is primarily a curve of fluctuations in industrial activity and follows fairly closely the Harvard Economic Society's curve showing the volume of manufacturing activity in the United States.

The American Telephone & Telegraph Co. does not base its forecasts on any business cycle theories; its statisticians give most weight to the most complete array of business and economic facts it is possible for them to obtain. These facts they obtain by reading and by outside contacts. By following this method they have reduced, they believe, the percentage of error. As a matter of fact, the telephone company's forecasts, which were begun in 1921, have made only one serious miscalculation, and that was for 1926. At that time the constructive elements which made 1926 such a big industrial year were underestimated and the elements which were apparently making for business recession were overestimated.

Adequate Lighting Increases Production and Decreases Accidents

THE importance of adequate lighting in the successful operation of industrial plants was emphasized by several speakers at a symposium on illumination, held jointly by the American Society of Mechanical Engineers and the Illuminating Engineering Society during the forty-ninth annual meeting of the A. S. M. E. at the Engineering Societies Building, New York, Dec. 3-7.

Adequate lighting will increase production, decrease accidents, reduce labor turnover and spoilage of work and assist in maintaining the health of employees, said C. C. Munroe and H. A. Cook, Detroit Edison Co., in their paper on "Light as a Factor in Production." An average increase of 15 per cent in output with increase in cost of lighting of approximately 2 per cent of the payroll cost was said to have followed the installation of a new lighting system in nine plants, most of which are metalworking. A saving of \$30,000 in spoilage on one operation in a large body-working plant is credited to installation of an improved lighting system.

In an adequately lighted plant the intensity is sufficient to enable the operator to perform his work with speed and accuracy. No glaring light sources are present to blind him temporarily or to produce undue eye fatigue; his vision is clear and unhampered, making efficiency possible. Spotted illumination has been eliminated, so the necessary adjustments of the eye are not as great as formerly, thus making it possible for him to work throughout the day without the strain caused by adverse conditions.

When the intensity of illumination is too low to permit quick discernment of necessary details, when glare is present due to bright light sources or reflections in the field of vision, and when the distribution of light in the working area is such that sharp contrasts of intensity are present, the lighting is inadequate.

Advocates Reserve Wiring Capacity in Installing Lighting System

Reserve wiring capacity in designing a lighting system was stressed by Ward Harrison, director of illuminating engineering, National Lamp Works of the General Electric

Co., Nela Park, Cleveland, in a paper on "Artificial Lighting Provisions in Building Design and Process Layout."

"Considerable ultimate economy will usually be effected if a certain factor of safety is provided in the wiring," he said. "That is, the copper is made heavy enough to carry a lighting load of approximately 4 watts per sq. ft., even though the immediate requirements for light may not be for more than half this amount. Obviously, also, the outlets should be spaced close enough together to provide reasonably uniform illumination over the working surface. This cannot be done by spacing them on 20-ft. centers with any ordinary ceiling height. With a 20-ft. spacing and lighting units 10 ft. above the floor (about 7½ ft. above the work) the variation in illumination between points directly under a lamp and those half-way between lamps is of the order of 4 to 1."

A graph showing the wiring installation costs per outlet, from data obtained in 11 cities, indicated that on the average the original installation expense is increased only 28 per cent when the wiring capacity is doubled, whereas to make this change after the building is completed and wired will usually much more than double the cost.

Use of 300-watt lamps on 10-ft. centers was said to be considered an excellent standard of general illumination. In discussing special lighting problems, Mr. Harrison stated that as industry becomes more established the trend will probably be toward specialized lighting for many processes. "With the present frequency of industrial changes, however, it will often be found less expensive to provide for a very high level of general illumination over the entire area, and thus avoid the necessity of varying the type and location of lighting equipment for each change of process or department location in a given plant," he said.

Another paper at this session was "Designing Buildings for Daylight," by H. H. Higbie, professor of electrical engineering, University of Michigan, Ann Arbor, Mich., and W. C. Randall, chief engineer, Detroit Steel Products Co. M. C. Huse, general sales manager, Philadelphia Electric Co., Philadelphia, and president of the Illuminating Engineering Society, presided at the symposium.

Economic Analysis of Jigs and Fixtures

Simple Formulas Developed to Help Solve Tooling Problems—Applicable Also to Punches, Dies, Special Equipment and Machine Tools

BY JOSEPH W. ROE*

THE first and most important element, which applies to all forms of work-holders, is the economic one. A certain amount of "tooling up" is an advantage wherever parts are to be produced in quantity, but how far it should go and how much capital should be tied up in special fixtures and tools depends on immediate conditions.

The question of the amount of expense justified has been handled largely on the basis of judgment. The besetting sin of the tool maker is to tie up money in fixtures which may show a heavy saving when in use, but are seldom used. A saving of 5 per cent in labor cost on a job in constant use might justify greater expense in fixtures than a saving of 90 per cent on a small job coming through only once or twice a year. Other factors besides saving in time and labor expense are involved, such as the life of the fixtures, due not only to their own wear, but to possible obsolescence of the article they make. Fixtures may be desirable even where only small quantities are involved, but the economic advantage of lower labor costs is the controlling factor unless some other consideration, such as improved interchangeability, increased accuracy, or reduction of labor trouble intervenes. Usually, where these latter reasons alone would have necessitated a fixture, it is found that the fixture lowers costs.

In the books available on work-holding devices are to be found methods of construction, much on the details, and examples of good practice in design, but almost nothing on the economics of the subject. It should be the first consideration and is usually given little thought. Few plants give to their fixtures the searching economic analysis which they apply to their power equipment. Until recently, the same has been true for materials-handling equipment; but thanks to the materials handling division of the A. S. M. E. formulas are now available, and are being increasingly used, which provide a standard basis for the economic analysis of equipment in that field and for determining the probable profit on any proposed installation for given costs and performance. These formulas take into account interest, depreciation, obsolescence, and other items of overhead which theretofore had been either neglected entirely, or had been handled differently by every one concerned. They can be used, with modifications and simplifications, for tool equipment just as well as for materials-handling equipment, and should be.

The following is a suggested adaptation of them for this use. Certain factors in the materials-handling formulas which are important in installations in that field are of less importance in dealing with fixtures or may drop out entirely. Others, such as the interest rate, taxes, etc., may

be taken as constant and brought together. This permits simplification.

With fixtures, as with other types of equipment, depreciation is made up of two factors, deterioration and obsolescence. As a rule these do not bear equally. In one case deterioration due to wear may be the chief factor. More often obsolescence due to liability of change in models or design may control. That one should be used which operates the faster.

Fixture Problem Centers on One or More of Four Items

In dealing with fixtures, the economic problem centers on answering one or more of the following questions:

1.—How many pieces must be run to pay for a fixture of given estimated cost which will show a given estimated saving in direct-labor cost per piece? For instance, how low a run must we have to justify a fixture costing \$400 which will save 3c. on the direct-labor cost of each piece?

2.—How much may a fixture cost which will show a given estimated unit saving in direct-labor cost on a given number of pieces? For instance, how much can we put into a fixture to "break even" on a run of 10,000 pieces, if the fixture can save 3c. on the direct-labor cost of each piece?

3.—How long will it take a proposed fixture, under given conditions, to pay for itself, carrying its fixed charges while so doing? For instance, how long will it take a fixture costing \$400 to pay for itself if it saves 3c. on the direct-labor cost per unit, production being at a given rate?

Questions 1, 2, and 3 assume that we just break even. There is also the very practical question: 4.—What will be the profit earned by a fixture, of a given cost, for an estimated unit saving in direct-labor cost and given output? For instance, what will be the profit on a \$200 fixture if it will save in direct-labor cost 3c. a piece on 10,900 pieces?

These questions involve something more than the simple arithmetic which seems all that is necessary for answering them, because, while the credit items for the fixtures depend mainly on the number of pieces machined, the debit items involve time, and also the number of set-ups required, i.e., whether the pieces are run off continuously or in a number of runs.

An important time element is that many companies now require that any new equipment shall pay for itself in a certain period. Investigations by the *American Machinist* and *Manufacturing Industries* show wide variation in practice as to this requirement, ranging from one to six or seven years, the longer period being used by railroad shops which have a stable class of work not liable to rapid obsolescence. The general practice seems to be about two years, but conditions even within one shop might warrant lengthening or shortening this period for different specific cases.

Proposed Formulas

The formulas reduce to the simple and workable forms found in equations [6], [7], [8], and [9] which follow, but

*Professor of industrial engineering, New York University. The article is taken from Professor Roe's paper, "Principles of Jig and Fixture Design," presented Dec. 3, at New York, before the American Society of Mechanical Engineers. The paper also includes a statement of the general principles of design and use of jigs and fixtures.

to use them correctly it is necessary to have clearly in mind the meaning of the symbols used.

Let N = number of pieces manufactured per year

Debit Factors

A = yearly percentage allowance for interest on the initial investment. (If the interest be taken on the depreciating value, this becomes, under uniform depreciation for n years,

$A \times \frac{1}{2} \frac{n+1}{n}$, the value of which decreases from A , for one year, and approaches $A/2$ as n grows large. For a life of two years this is $3A/4$, for three years it is $2A/3$. In the following formula either the original cost or the depreciating value can be used with equal facility. It is recommended, however, that one or the other basis be used uniformly to facilitate comparisons)

B = yearly percentage allowance for insurance, taxes, etc.

C = yearly percentage allowance for upkeep

$1/H$ = yearly percentage allowance for depreciation and obsolescence on the basis of uniform depreciation where H is the number of years required for amortization of investment out of earnings

E = yearly cost of power, supplies, etc., consumed, in dollars. (When the equipment under consideration is wholly new, this item appears in full. When it replaces old methods or equipment, the difference only is used. It is a debit if the E on the new equipment exceeds that on the old. It is a credit if the new E is less than the o'd. E in the formula may therefore be $+$ or $-$.) In many cases, with fixtures this item is small and may be disregarded

I = estimated cost of the equipment or fixture, i.e., cost installed and ready to run, including drafting and tool-room time, material and tool-room overhead, in dollars

K = unamortized value of the equipment displaced, less scrap value, in dollars. Note: In the case of fixtures for new work, K drops out

$YCSU$ = Yearly Cost of Set-Ups, in dollars. This should include the time required for taking down the apparatus and putting machine into normal condition. In some plants with departments large enough to employ several tool setters regularly this time can be included in the department overhead. In this case this factor disappears as a separate item.

Credit Factors

S = yearly saving in direct cost of labor, in dollars
 $= N$ (old unit labor cost, minus the new unit labor cost)
 $= N$ (saving in unit labor cost)
 $= N (SULC)$ using initials as a mnemonic symbol. This covers direct unit labor cost only

T = yearly saving in labor burden, in dollars
 $= St$ (t is the percentage used on the labor saved)
 $= N (SULC) t$

(Note: The latest form of the materials-handling formulas breaks this into T_a = burden on labor saved and T_b = burden on the equipment displaced. For use with fixtures the latter element may usually be disregarded for simplification.)

U = yearly saving or earning through increased production in dollars
 $=$ saving in unit labor cost $\times$ increased yearly production capacity

$\times$ the percentage of that increased capacity which will be utilized

$\times (1+t)$ (this cares for the burden saved)

$+$ cost of extra old equipment which would be necessary to care for the increase if the improvement were not adopted

(Note: In many cases U may drop out.)

V = yearly net operating profit, in excess of fixed charges, in dollars.

Proposed Formulas

If we just "break even" we have: The yearly operating savings = total fixed charges per year. Using the above symbols

$(S + T + U - E) - \text{Yearly Cost of Set-Ups}$

$$= I(A + B + C + 1/H) + KA$$

Since

$$S + T = N(SULC) + N(SULC) t = N(SULC) (1 + t)$$

Then

$$N(SULC) (1 + t) + U - E - (YCSU) = I(A + B + C + 1/H) + KA \dots [1]$$

To find the number of pieces required for a given cost I we have, solving for N ,

$$N = \frac{I(A + B + C + 1/H) + (YCSU) - U + E + KA}{(SULC) (1 + t)} \dots [2]$$

To find the cost I which will just earn fixed charges we have, solving equation [1] for I ,

$$I = \frac{N(SULC) (1 + t) - (YCSU) + U - E - KA}{(A + B + C + 1/H)} [3]$$

To find the net operating profit over all fixed charges we have

$$V = \text{gross operating profit, less set-ups and fixed charges} = N(SULC) (1 + t) - (YCSU) - I(A + B + C + 1/H) + U - E - KA \dots [4]$$

To find the time H in years for the fixture to just pay for itself, the net profit V in equation [4] = 0

Therefore, setting the right-hand side of equation [4] equal to 0 and solving for H , we have

$$H = \frac{I}{N(SULC) (1 + t) - (YCSU) - I(A + B + C) + U - E - KA} \dots [5]$$

In most cases it will be found that U , E , and KA may be neglected, so that equations [2], [3], [4], and [5] may be written as follows:

$$N = \frac{I(A + B + C + 1/H) + (YCSU)}{(SULC) (1 + t)} \dots [6]$$

$$I = \frac{N(SULC) (1 + t) - (YCSU)}{(A + B + C + 1/H)} \dots [7]$$

$$V = N(SULC) (1 + t) - (YCSU) - I(A + B + C + 1/H) \dots [8]$$

$$H = \frac{I}{N(SULC) (1 + t) - (YCSU) - I(A + B + C)} \dots [9]$$

To be of practical value the formulas should be as simple as possible and yet reflect the essential conditions, and should be easily applied.

Equations [6], [7], [8], and [9] meet this condition for most fixtures. They take into account the number of pieces manufactured, the saving in unit labor cost, the overhead on the labor saved, the cost and frequency of set-ups, interest on investment, taxes, insurance, upkeep, and depreciation. The fuller formulas, equations [2], [3], [4], and [5], take into account, in addition to the above, the value of increased production capacity, cost of supplies and extra power, and interest on equipment displaced, if it is deemed that conditions require their consideration. These may be used for the more elaborate fixtures and for analyzing the purchase or building of machine tools.

In using the formulas it must be remembered that N is the number of pieces manufactured in a year, not per run, except for the case of a single run of less than one year's duration.

The items A , B , and C , once settled upon, need change little. If the plant has the practice of requiring new equipment to pay for itself in a definite time H , say two years, the depreciation $1/H$ may be added to the other carrying

charges, making a single percentage factor for the term $(A + B + C + 1/H)$ which can be used until the management deems that changed conditions require modification.

Examples of Economic Analysis of a Fixture

To illustrate economic analysis of a fixture by the use of these formulas, assume the following data:

Estimated unit saving in direct-labor cost	= 3c.
Burden on labor saved	= 50 per cent
Estimated cost of each set-up	= \$10
A	= 6 per cent
B	= 4 per cent
C	= 10 per cent
H	= 2 years
1/H	= 50 per cent
$A + B + C + 1/H$	= 70 per cent

If $I = \$400$, to find the number of pieces to be put through each year in one run per year, we have from equation [6]

$$N = \frac{\$400 \times 0.70 + \$10}{\$0.03 \times 1.5} = 6450 \text{ pieces}$$

That is, if a \$400 fixture is to pay for itself in two years and carry overhead, with a single run per year 6450 pieces must be put through each year.

If, instead, the pieces are put through in six runs per year, then

$$N = \frac{\$400 \times 0.70 + \$60}{\$0.045} = 7550 \text{ pieces}$$

That is, more pieces must be run per year, due obviously to the increased number of set-ups.

There is of course a breaking point where it pays to have multiple runs, even at a higher production cost per piece, due to the balancing of production costs and fixed charges on increased inventory. Formulas are available elsewhere for determining this economic length of run.

Suppose the fixture is to pay for itself in a single run, how large must that run be?

In this case H is unity, as the fixture must pay for itself within the year, and $A + B + C + 1/H = 6\% + 4\% + 10\% + 100\% = 120\%$ then

$$N = \frac{\$400 \times 1.20 + \$10}{\$0.045} = 10,900 \text{ pieces}$$

This says that a smaller *total* output is required than when 6450 pieces are called for, for *two* years, or 12,900, due to one less set-up and carrying the overhead for only one year instead of two.

It will be noted that this assumes the full-year values for A , B , and C . If the run is short and it is felt that this is too drastic, the values could be cut down in the proportion of the actual running time to one year. It would be

safer and therefore good practice to use the yearly rates, as the time for the complete turnover of the money going into the fixture is hard to determine and certainly is longer than the mere run itself. The cost of short-lived equipment should be extinguished as soon as possible.

Reversing the above assumptions, how much money could we put into a fixture for a single run of 10,900 pieces at an estimated saving of 3c. per piece? From equation [7]

$$I = \frac{10,900 \times \$0.045 - \$10}{1.20} = \$400$$

Similarly, if we want 7550 pieces a year in six runs per year, and want the fixture to pay for itself in two years, we have from equation [7]

$$I = \frac{7550 \times \$0.045 - \$60}{0.70} = \$400 \dots \dots [10]$$

If we want to know the reverse of this, namely how long a time it would take a \$400 fixture to pay for itself, we have from equation [9]

$$H = \frac{\$400}{7550 \times \$0.045 - \$60 - \$400 \times 0.20} = 2 \text{ years}$$

From equation [10] we see that we would "break even" with a cost of \$400. Suppose now we can design a fixture for the same conditions which would cost \$250 instead of \$400 what will be the *profit*? Using equation [8] we have, for 7550 pieces per year in six runs per year

$V = 7550 \times \$0.045 - \$60 - \$250 \times 0.70 = \105 per year
For a *single* run of 10,900 pieces the profit would be

$$V = 10,900 \times \$0.045 - \$10 - \$250 \times 1.20 = \$180.50$$

Formulas [3] and [7] may be used to help in deciding between two fixtures of different degrees of refinement for the same job. For instance: For a single run of 2000 pieces, under the above conditions, how much can we afford to put

- (a) Into a fixture if it will save 3 cents per unit, with a set-up cost of \$10 or
- (b) Into a more refined fixture which will save 5 cents per unit, with a set-up cost of \$15

We have from equation [7]

$$\text{For (a) } I_a = \frac{2000 \times \$0.03 \times 1.5 - \$10}{1.20} = \$66.66$$

$$\text{For (b) } I_b = \frac{2000 \times \$0.05 \times 1.5 - \$15}{1.20} = \$112.50$$

Obviously also the same formula may be used to compare the amounts which might be put into fixtures for different lengths of run.

The above examples show how the formulas proposed may help in deciding tooling-up problems as they arise. They apply not only to jigs and fixtures but to punches and dies, special tool equipment, and, in the fuller forms, to proposed machine tools.

Nickel-Chromium Resistance Wires

A STUDY of nickel-chromium alloys, containing up to 60 per cent chromium, with or without tungsten or molybdenum up to 20 per cent has been made by C. J. Smithells, S. V. Williams, and J. W. Avery, and reported to the (British) Institute of Metals. They are solid solution alloys up to the following approximate limits: 45 Cr, 55 Ni; 20 Cr, 70 Ni, 10 W or Mo; 10 Cr, 75 Ni, 15 W or Mo. With more chromium in the binary alloy, or more tungsten or molybdenum in the ternary alloy, a second phase causes it to become unsuitable for resistance wire.

Alloys were made of mixed powders, melted in a tube furnace under hydrogen in a magnesia boat; double melting gave sound ingots. Solid solution alloys could be readily rolled, swaged or drawn to 0.375-mm. wire.

Relative merit was determined by electrically heating a short coil to 1100 deg. C., and noting the life in still air. It was found that at least 20 per cent chromium in the alloy was necessary, that the scale produced on the surface should be adherent and protective. The best life under continuous heating was given by the 20:70:10 Cr:Ni:W alloy; the best for intermittent heating by the corresponding analysis with molybdenum. It was also found that alloys made with electrolytic nickel were markedly superior to those made with reduced nickel, or to commercial resistance wires of the same nominal composition. Data are contained in the paper on the electrical resistivity of the wires, and on the variation of this property with changes in temperature.

Making Large Plates of Alloy Steel

Avoid Splashing During Teeming and Chilling During Stripping—Chipped Slabs Are Cleaned of Scale in Rolling Process

AT the Montreal Meeting of the American Society for Steel Treating the physical properties of the 3-per cent nickel steel plate used for locomotive boilers by the Canadian Pacific Railroad were described (see *THE IRON AGE*, Feb. 23, page 536). The manufacture of such plates was discussed by Charles McKnight and W. G. Humpton,* before the American Society of Mechanical Engineers, Chicago, Nov. 14. Their paper deals with steels having nickel between 2 and 3 per cent without other alloying elements, manufactured into large plates between $\frac{1}{4}$ and $1\frac{1}{2}$ in. thick. In general, however, the practice is applicable to other alloy steels and other sizes.

Manufacture of Steel

During melting it is only necessary to use ordinary precautions to insure a good sound steel. Nickel is introduced by nickel steel scrap, and by adding metallic nickel. It is not oxidized during the heat. Either the acid or basic process may be used. The open-hearth furnaces themselves are conventional in every respect, of from 50 to 100 tons capacity, fired with oil or gas.

First and most important is the killing of the steel, since blowholes in the ingot do not weld up satisfactorily. This is accomplished by the addition of silicon, manganese and aluminum to the bath or ladle.

Ingot Practice Exact

Utmost care and minutest precautions during casting are amply repaid in fewer defects and less rejections. An ingot of satisfactory size for plates is 48 in. x 21 in. x 19,000 lb. with a hot-top. About 3000 lb. of metal will be cropped from the top.

Aside from the hot-top, the design of the mold (taper, wall-thickness and proportions) is most important. A mold

*Metallurgists International Nickel Co. and Lukens Steel Co. respectively.

with fluted walls, making the ingot shown, gives excellent results.

The greatest number of rejections after rolling are due to imperfections originally in the ingot surface. Consequently the greatest care is necessary in pouring to avoid such defects as splashes, laps, stop-pours and mold-pulls. Bottom-pouring is thought by some to result in a superior ingot surface, but it has at least two objections. First is the complication of setting up bottom-plates and runners and later cutting away these sprues. Second, refractory material is often cut loose from the runners by the stream of molten steel. Such an inclusion in an ingot is often more serious than the minor surface defects the process is supposed to eliminate.

Therefore, while bottom-pouring has been largely employed on deck-plate armor of this analysis, the recent trend is toward top-pouring with due care to avoid splashes. One scheme is to place a stove pipe of blue annealed steel in the center of the mold before pouring. This catches the splash, and melts quickly in the rising metal.

Mold washes are also employed by some, either the simple tar smoke coating, a tar or lime wash, or a wash containing flake aluminum. The latter has the added advantage of eliminating any small surface blowholes through chemical action.

Stripping and Reheating

As soon as it solidifies throughout it should be stripped from the mold. This should be done in the soaking pit building where the tender outside surface will be protected from chilled air, and it can be placed immediately in a pit. The latter should remain approximately at the temperature of the ingot for an hour or more, to equalize the hot interior and the cold exterior of the metal. Then the pit should be gradually heated to 2150 deg. Fahr. with a smoky flame. If the ingot gets too hot or an oxidizing flame is used, the original scale on the ingot will fall off and it will be extremely difficult to clean the plate during rolling of the second scale which forms.

An ingot of nickel steel should not be allowed to become cold until after some work has been done on it.

Rolling and Cleaning

It is essential to clean the plate during rolling. This is best accomplished by high-pressure water, salt and old burlap soaked in brine. The water is directed from a series of jets at the surface of the plate as it passes through the rolls; the salt is applied at any time during the rolling and quite generously during the last few passes, while the brine-

soaked burlap is thrown by men, especially stationed for that purpose, in such a way as to hit the spots which need cleaning just as the rolls strike them. Care and attention are productive of better results than the choice of cleaning materials.

Such methods, used for many years in the production of protective deck-plate, have the defect of cleaning only the top surface. The Lukens company uses the very simple device shown to turn the plate over on the tables during rolling, whereby both top and bottom surfaces may be observed and cleaned.

The process of rolling at the plant just mentioned is as follows: The heated ingot is first given one or two passes in a longitudinal direction to "sadden" the ingot. It is then cross-rolled for width. When the ingot is reduced about half in thickness and to a size suitable for reheating, it is cooled and inspected. It is then chipped with pneumatic chisels to remove serious surface defects, although often the entire top and bottom surface is planed off—an expensive treatment which is frequently justified.

Cleaned slabs are then carefully reheated and finish-rolled on a four-high reversing mill. When the plate has been subjected to the heavier drafts and after the top surface has been cleaned by the use of burlap and salt, as above described, it is turned over so the bottom surface can be cleaned while rolling is completed.

Flattening and Heat Treating

Since alloy steel plate hardens when cooled rapidly from the last pass, the quenching effect of the flattening rolls makes important changes in the tensile properties of the cold metal.

Generally speaking, the best combination of physical properties in nickel steel plate is obtained if it is finished at a good red heat (1450 to 1500 deg. Fahr.) and allowed to cool slowly through the critical range on the cooling bed by piling one plate on top of another or by taking them off the beds, piling and covering with sand. Restraightening is done later.

There is a growing conviction among users that plates,

Cradle Engaged in Turning Slab, to Clean Under Side

even of carbon steel, may be more safely and efficiently used if normalized prior to use. It is not known that this heat treatment is being given, except sporadically, by any mill, but the authors believe that sooner or later all plants will be equipped with furnaces sufficiently large to heat-

*Box Pouring
Ingots in Pairs,
Using Stove Pipe
to Control Splash*

treat all plates. While both the manufacturers and users of alloy steel plate will be benefited by such practice, it is more of a refinement than a necessity. It is of interest to note that nickel steel plates for the latest locomotives were ordered normalized after rolling.

Micro Structure of 3 Per Cent Nickel Steel Boiler Sheet, 273 x 145 x 13/16 In. 100 diameters. As rolled and after being normalized

Defects an inspector looks for are "snakes," pits and embedded scale. "Snakes" (long, wavy surface seams of slight depth) are the hardest to control. Careless pouring and stripping seem to cause most of them.

When they occur, they must be ground out. This prac-

tice has been permitted by the United States Navy for a number of years, but it is unacceptable to some purchasers of boiler plate. If the snakes are not too long, an abrasive wheel may be used of diameter sufficiently great so the trough ground out will have no sharp corners. To be sure the defect is removed, the clean ground surface should be etched with a 50-per cent solution of hydrochloric acid. If no trace of the seam remains after this treatment and the plate is not reduced in thickness beyond permissible limits, it should be considered good delivery.

Testing

Killed steel is very uniform and shows little difference in the tensile tests taken from the top or bottom; the transverse strength and the longitudinal strength are also about the same. "Open" steel, however, which, from its nature, is a segregating steel, will show considerable variations in these positions. By the same token, the variation in analysis in different parts of the plate or ingot of killed alloy steel is much less than in ordinary carbon steel.

Microscopic examination is rarely called for by the purchaser. The main defects which show up under such examination are laminations and large grain. The latter is due to high finishing temperatures and is not important if the steel successfully passes the tensile and bend tests.

Laminations are of two kinds. The first is due to a segregation of the pearlite and ferrite constituents of the steel into layers; this is quite common in all plates, and is probably due to more rolling in one direction than in another. It is rarely a serious defect. The other is an actual separation of the metal and is usually caused by incomplete cropping of the plate, so that a portion of the pipe remains.

What Will Carbide Tools Do to Machine Tool Design?

DR. S. L. HOYT, research laboratory General Electric Co., presented a short paper entitled, "Carboloy and Tungsten Carbide Tools," before the American Society of Mechanical Engineers. It is supplemental to a similar one before the Steel Treathers' Philadelphia meeting (see *THE IRON AGE*, Oct. 18, page 959). It will be remembered that Carboloy is an excessively hard composition made by mixing about four parts powdered tungsten carbide with one part cobalt, pressing to shape, and sintering in a vacuum furnace. It is used as an inset at the cutting edge of the tool; the joint is made by "coppering" the bit into a slot milled into a nickel steel shank. (The process is described in *THE IRON AGE*, May 10, page 1305.)

Grinding is done by a light pressure on a dry carborundum wheel; limits of half a mil may be had by lapping with boron carbide powder. Such lapping is necessary to make keen edged tools for finishing cuts.

Most of the tools made so far have been used on such non-metallic abrasive materials as indicated by the following: On Bakelite, Dr. Hoyt says, it does 70 times the work of high-speed steel before regrinding is necessary. In turning soft porcelain insulators the Carboloy lasts indefinitely, and it has changed this work from a hand job to a machine. On fiber the best speed for surface finish is too high for satisfactory endurance of high-speed steel, but easily within the ability of the new tools.

Working on metals it satisfactorily cuts tough aluminum bronzes, and hard manganese steel castings. On ordinary machine steel, plain or alloy, it is most useful on such work as can be cut with light feeds at a very high speed—in other words, under conditions which put moderate pressures on the somewhat fragile tool.

Most of the discussion on the paper was based on the premise that the carbide tool materials would supplant high-speed steel in such machine work as is now done on

steels and cast iron. E. F. DuBrul, general manager National Machine Tool Builders Association, Cincinnati, said that an extensive fundamental research should be immediately organized if we are to determine the limiting capabilities of carbide tools, so that machine tool builders could have the necessary data wherewith to design equipment powerful and fast enough. Even though such an investigation would cost several hundred thousand dollars, this figure would be much less than the total cost of reaching the same point by a number of intermediate designs. Furthermore since the users of the new equipment would be the chief beneficiaries, they should be expected to underwrite the bulk of the investigation.

A. L. De Leeuw, consulting engineer, New York, however, was doubtful whether the present type of lathe or boring machine could ever be speeded up to the limit of the new tool. He therefore visualized an entirely different type of machine, where the work moved with moderate speed, but a well balanced tool holder, with multiple cutters, moved at extremely high speed. The forerunner of such equipment is now the grinder, but in this tool the cutters are of haphazard shape and setting, so that only a minute proportion of the cutting grains work efficiently.

Taking a more conservative view, E. J. Kearney, secretary Kearney & Trecker Corporation, Milwaukee, pointed out that the high speeds available with carbide tools are useful only to firms which have acute problems of mass production. Since such problems are now solved by installing special machine tools, it will require no undue waste to build others for the new tools with proper speed, power and rigidity. On the other hand, there will always be a large use for machines using high-speed steel at slower speeds, and for universal machines, just as there are now still in use in jobbing shops thousands of lathes dating back to the last century, before high speed was developed.

Introducing an Incentive Plan

Care Must Be Taken to Gear Up Plant and Personnel to New Wage Method—How the Dyer System Works

BY PHILLIP H. CONE*

A WAGE incentive system of the Dyer type, wherein the total number of minutes of every employee's time is accounted for, is a vehicle of tremendous possibilities in obtaining efficiency and in reducing costs in manufacturing plants. It can be likened to a good automobile providing transportation with advantages that cannot be obtained in any other way. But the mechanism of the automobile must be thoroughly understood and it must be intelligently handled. So it is with the incentive system. It will take a shop from one degree of efficiency to a higher degree in various intervals of time according to the understanding and ability used in operating it. It is not an automatic cure-all or self-energizing instrument, but a high-speed tool, which, to attain maximum results, requires the proper amount of power and feed behind it. Indeed, during and after installation, the management alone can furnish this power and feed.

How to Overcome the Resistance of Workmen

When a wage incentive system is installed in a plant, the management must remember that any new method is resisted throughout a shop until it has been proved beneficial, and when it affects the pay check of the men the resistance is greatly increased. With this fact in mind, the management must first sell the supervisory organization, namely the superintendent and foremen, because their full cooperation is vital if the best results are to be obtained. Incidentally, the management can go much further than anyone else in selling the incentive plan and moreover, it is not reasonable to expect the incentive engineer to carry the burden of selling the plan singlehanded to everyone in the plant in addition to setting up its application.

When the wage incentive plan is being installed in a department, the management, by spending from one-half to one hour a day on the problem, can inform itself as to how the setup is being made. By so doing it is in a position, when the plan is put into operation, wherein it is convinced of the fairness of the setup and therefore can intelligently stand behind it.

Success of Plan May Require Changes in Processes

Various problems come up while the time study is being made. The duties of the workers, for example, may have to be rearranged in order that each man has a sufficient amount of work to permit him to produce standard performance, or again some manufacturing process may be changed to advantage. In such cases the daily contact of management results in the changes being accomplished expeditiously. The management must drive home to the employees the fact that the incentive department is and always will be fair and impartial toward both the company and the men in the ranks. Furthermore, it is necessary to see that the incentive department always maintains this characteristic as one of the vital elements of its work and

that as time goes on its fairness and precision merit additional confidence and trust.

When the time studies were completed and checked at our plant, we called together the workmen of the department in which the plan was to be applied the following day and explained to them its function, assuring them of its fairness and asking their cooperation. Incidentally, from the first day the plan becomes effective the immediate problem is to get the department efficiency to the point where the men earn a premium. To accomplish this is needed at various times leadership, some joshing, perhaps some driving and, above all, confident assurance. But these elements cannot best be used unless there is intelligent understanding on the part of the management. However, when the men once get a taste of extra earnings, the department is "over the top" and the management can count on their sincere cooperation.

Program Stresses Common Interests of Management and Men

Application of the program just described results in certain definite benefits. The management gets a new and detailed picture of what is going on in the plant. Furthermore, the combined effort of the management and of the shop organization in setting the plan into action gives each a better appreciation of the common good of the plant. Too often the shop doesn't appreciate the viewpoint of the management and the management in turn does not appreciate the troubles of the men on the firing line. Moreover, during the process of making time studies the qualities of workmanship must be thoroughly considered in order that the amount of work necessary for a job may be determined. The qualities of workmanship too often vary to the detriment of the product, and the establishment of a standard in such a situation is of great value. In addition, the management sets an example by intelligently understanding the work and as a result the whole organization keeps step and is prepared to go on with the job after the installation has been made.

In the Dyer system the common denominator, or "unit," is the amount of work that an average man working at an average rate of speed will do in one minute. The workman is paid a premium for all units produced over and above standard performance, which is 60 units for every 60 min. of work. The premium is computed by calculating the total units produced during the day against the total minutes of time the workman spends in the department. Credit is allowed the workman for loss of time not under his control. The foreman is paid a premium based on the efficiency of the men in his department, modified by the loss of time occurring therein and by excessive expense over and above a standard that is set up on this item.

All of Workman's Time Accounted For

Production is tabulated by checkers spending full time in the department to which they are assigned. They also tabulate all delays and waste time. If a checker is encouraged to observe and learn operating methods, he becomes

*Assistant manager foundry division, Cincinnati Milling Machine Co., Cincinnati. Abstract of paper presented at meeting of Cincinnati Chapter of National Association of Cost Accountants.

not only a valuable assistant to the foreman by advising him immediately of conditions which should be corrected, but also the future foreman in training.

The control sheet is a cumulative weekly record for each department showing the total units produced. It accounts for every minute expended by every man in the department during the week and expresses the cost of time in terms of productive labor, non-productive labor and waste labor per 1000 units produced. It also shows the average efficiency of the workmen. At the top of the control sheet in a line known as the "reference period" is the efficiency of the department before the application of the system. Study of the sheet each week gives a picture of the current results accomplished and the comparison of the weekly record with the reference period tells how much money is being saved.

Study of Records Leads Way to Increased Efficiency

On a separate form just under the control sheet is the work sheet, which amplifies the data on the control sheet. Study of it reveals the reason why a large amount of work must be done in the future to arrive at a still higher rate of efficiency. Some of the factors retarding the development of further savings may be lack of sufficient equipment, absence of a maintenance system which would obviate the necessity of men standing idle while equipment is repaired, use of a productive workman's time to get material or to do some other non-producing task and the tardiness of departments in delivering materials to the main assembly departments.

Through the establishment of a wage incentive system, provided that the management creates and leads in a desire for progress, it is possible to transform an organization hitherto working in a habitual routine into a thinking organization. To place a definite value on the change-over is hardly possible, but its worth can be appreciated. Briefly, the principal beneficial effects can be summarized as follows:

1. Management becomes familiar with important details generally overlooked.
2. The viewpoints of the management and of the shop organization are blended for the common good and better cooperation results.
3. The workmen earn increased wages.
4. Foremen or supervisors earn larger salaries.
5. The training which the checker gets makes him the potential foreman for future needs.
6. A fixed standard of workmanship is established, resulting in a more uniform product.
7. A guide and control for efficiency becomes the tool of the whole organization.
8. Waste becomes the common foe of all.
9. The true value of time is appreciated.
10. An organization heretofore leveled off by routine becomes a thinking organization.
11. New production methods are developed.
12. Constant progress is made toward higher efficiency.
13. The company earns greater profits.

Safety Not Entirely a Mechanical Matter

Human Element Looms Large and May Defeat Best Outfit of Safety Devices Ever Installed

BY JOHN H. WATSON, JR.*

IT is not an easy task to obtain satisfactory results in industrial accident prevention. A large proportion of employees, as well as of other individuals, are naturally habitually careless. Because injury is not sure to result from carelessness, they almost entirely discount the possibility of injury resulting therefrom. They often avoid the use of safety devices furnished them for their own protection, if to use them means a little extra work or trouble. Many of them are even inclined to resent the attempts of the employer to make them utilize safety methods for their own protection.

Even if the safety men be never so hard working, never so zealous, in their crusade for safety, they cannot obtain the desired results without the organized cooperation of the plant superintendents, the foremen and sub-foremen, and the big bulk of the workmen. It is a real problem, how to obtain such cooperation. The safety men must have and use rare tact and good sense in their dealings with the plant managers and men; and right here is where the officers of the company should do their part toward the accomplishment of the safety program. They should support their safety men in all reasonable demands which tend to secure safety, and they should let the whole plant organization know that they stand squarely behind the safety men in such reasonable demands.

Large Drop in Lost-Time Cases

Our industrial accidents have shown a steady decrease since we embarked on a safety crusade. Our lost-time accidents in 1924 amounted to 430; in 1925, to 345; in 1926,

to 174; in 1927, to 46; in the first 10 months of 1928, to 20, although during most of the 10 months we have been operating nearly to capacity. Our blast furnaces have a record of operating 449 days in a stretch without a single lost-time accident. Our open-hearth department has a record of operating 401 days in a stretch without a single lost-time accident. Once in a while, but not often, our entire plant will operate for a month without a single lost-time accident. It did so in October of this year, and there had been no lost-time accident in November up to Nov. 15, making a period of at least 45 days without a single lost-time accident in the entire plant.

Our safety organization, which has been worked out by Dr. R. C. Engel and which I believe to be efficient, is as follows:

The active safety organization consists of a safety inspector from each plant department, appointed from the assistant superintendents and general foremen, and numbering 14 in all, with Dr. Engel at their head. This group meets weekly. At these meetings reports of accidents are presented, investigation is made of the circumstances attending them, and ways and means of preventing similar accidents in the future are discussed. New ideas with reference to safety equipment and safety methods are presented to and discussed at these meetings. Heating, ventilating, lighting and sanitation problems pertaining to the plant are brought before the meetings. In these discussions every safety inspector takes an active part.

General Committee Examines Devices

A general safety committee, consisting of the superintendent of the blast furnaces, the superintendent of the

*President Corrigan, McKinney Steel Co., Cleveland. This is abstract of a paper read before the All-Ohio Safety Congress.

coke plant, one of the superintendents representing the steel plant and the company's chief engineer, together with Dr. Engel, who acts as chairman, meets once a month. All questions relating to safety devices are brought before this committee for thorough investigation and decision. It is a rule that all safety matters brought before this committee must have an expression of opinion from the proper department superintendent, before any action is taken. The general safety committee recommendations with regard to safety devices are forwarded to the management for the necessary authorization. Through the foregoing procedure, every department superintendent in the plant is made thoroughly conversant with all safety suggestions pertaining to his department and with the cost attendant upon the installation of safety devices.

Safety meetings are held in each department of the plant at least once a month. These meetings are attended by all assistant superintendents and foremen and are presided over by the superintendent of the department.

Functions of the Service Department

Dr. Engel's department, called the service department, sends a weekly safety report to the plant superintendents, safety inspectors and foremen, showing the safety standing

of all departments in the plant, thus creating a friendly competition between departments. The service department investigates near lost-time accidents, and studies ways and means of preventing similar accidents. It issues to each superintendent and safety inspector a daily report of all accidents which have occurred in their departments, and brings to the attention of the superintendent reports of safety violations or unsafe practices in his department.

Through the safety inspectors, the service department makes a general safety inspection of the entire plant. Through its employment bureau, it instructs all new employees as to safety methods and safe practices, and uses a follow-up system through personal contact, until the new employee becomes thoroughly familiar with his job.

Through the safety organization which I have outlined, and the active co-operation of the whole plant organization, we have been able to obtain progressively favorable results, as I have already indicated. We hope to make further progress. We may attain practically 100 per cent of perfection in the matter of safety devices, but human frailty does not permit a 100 per cent control of the human element. We believe that we have not yet reduced our accidents to the irreducible minimum, and we hope next year to better this year's record.

Productivity and Markets Intimately Related

Mass Production Economical Only When An Unhampered Market Is Available—Finding Such Markets the Task for Managers

AT a meeting of the British Association for the Advancement of Science, held recently in Glasgow, Scotland, Prof. Allyn A. Young presented an address on "Increasing Returns and Economic Progress." As Professor Young, the president of the section on economic science and statistics, is an American (formerly on the Harvard faculty but now teaching at London University), his comparisons of business conditions as they exist in America and in England were widely quoted. In his opinion the growth of markets has been one of the prime factors in industrial progress for more than a century, and its influence is no less clear in years since the war when "mass production" and "rationalization" have been the catch-words. Extracts from the address follow:

It appears to be generally agreed that Adam Smith, when he suggested that the division of labor leads to inventions because workmen engaged in specialized routine operations come to see better ways of accomplishing the same results, missed the main point. The important thing in the division of labor is that a group of complex processes is transformed into a succession of simpler processes, some of which lend themselves to the use of machinery. In the use of machinery and the adoption of indirect processes there is a further division of labor, the economies of which are again limited by the extent of the market. It would be wasteful to make a hammer to drive a single nail; it would be better to use whatever awkward implement lies conveniently at hand. It would be wasteful to furnish a factory with an elaborate equipment of specially constructed jigs, gages, lathes, drills, presses and conveyors to build a hundred automobiles; it would be better to rely mostly upon tools and machines of standard types, so as to make a relatively larger use of directly applied and a relatively smaller use of indirectly applied labor. Mr. Ford's methods would be absurdly uneconomical if his output were very small and would be unprofitable even if his output were what many other manufacturers of automobiles would call large.

Then, of course, there are economies of what might be called a secondary order. How far it pays to go in equipping factories with special appliances for making hammers or for

constructing specialized machinery for use in making different parts of automobiles depends again upon how many nails are to be driven and how many automobiles can be sold. If the benefits and the costs of using such appliances are spread over a relatively large volume of final products, their technical effectiveness is a larger factor in determining whether it is profitable to use them than any difference which producing them on a large or a small scale would commonly make in their costs. In other instances the demand for productive appliances is more elastic, and beyond a certain level of costs, demand may fail completely. In such circumstances secondary economies may become highly important.

Doubtless, much of what I have said has been familiar and even elementary. I shall venture, nevertheless, to put further stress upon two points. The first point is that the principal economies which manifest themselves in increasing returns are the economies of capitalistic or roundabout methods of production.

Mass Production May Easily Become Wasteful

THE second point is that the economies of roundabout methods, even more than the economies of other forms of the division of labor, depend upon the extent of the market—and that, of course, is why we discuss them under the head of increasing returns. It would hardly be necessary to stress this point, if it were not that the economies of large-scale operations and of "mass production" are often referred to as though they could be had for the taking, by means of a "rational" reorganization of industry. Now I grant that at any given time routine and inertia play a very large part in the organization and conduct of industrial operations. Real leadership is no more common in industrial than in other pursuits. New catch-words or slogans like "mass production" and "rationalization" may operate as stimuli; they may rouse men from routine and lead them to scrutinize again the organization and processes of industry and to try to discover particular ways in which they can be bettered. For example, no one can doubt that there are genuine economies to be achieved in the way of "simplification and standardization," or that the securing of these economies requires that certain deeply rooted competitive

wastes be extirpated. This last requires a definite concerted effort—precisely the kind of thing which ordinary competitive motives are often powerless to effect, but which might come more easily as the response to the dissemination of a new idea.

There is a danger, however, that we shall expect too much from these "rational" industrial reforms. Pressed beyond a certain point they become the reverse of rational. I have naturally been interested in British opinions respecting the reasons for the relatively high productivity (per laborer or per hour of labor) of representative American industries. Those who hold that American industry is managed better, that its leaders study its problems more intelligently and plan more courageously and more wisely, can cite no facts in support of their opinion save the differences in the results achieved. Allowing for the circumstance that British industry, as a whole, has proved to be rather badly adjusted to the new post-war economic situation, I know of no facts which prove or even indicate that British industry, seen against the background of its own problems and its own possibilities, is less efficiently organized or less ably directed than American industry or the industry of any other country.

Power-Driven Machinery Requires Scarce Labor

SOMETIMES the fact that the average American laborer works with the help of a larger supply of power-driven, labor-saving machinery than the laborer of other countries is cited as evidence of the superior intelligence of the average American employer. But this will not do, for, as every economist knows, the greater the degree in which labor is productive or scarce—the words have the same meaning—the greater is the relative economy of using it in such indirect or roundabout ways as are technically advantageous, even though such procedure calls for larger advances of capital than simpler methods do.

It is encouraging to find that a fairly large number of commentators upon the volume of the American industrial product and the scale of American industrial organization have come to surmise that the extent of the American domestic market, unimpeded by tariff barriers at the State boundaries, may have something to do with the matter. This opinion seems even to be forced upon thoughtful observers by the general character of the facts, whether or no the observers think in terms of the economists' conception of increasing returns. In certain industries, although by no means in all, productive methods are economical and profitable in America which would not be profitable elsewhere. The importance of coal and iron and other natural resources needs no comment. Taking a country's economic endowment as given, however, the most important single factor in determining the effectiveness of its industry appears to be the size of the market. But just what consti-

tutes a large market? Not area or population alone, but buying power, the capacity to absorb a large annual output of goods. This trite observation, however, at once suggests another equally trite, namely, that capacity to buy depends upon capacity to produce. In an inclusive view, considering the market not as an outlet for the products of a particular industry, and therefore external to that industry, but as the outlet for goods in general, the size of the market is determined and defined by the volume of production. If this statement needs any qualification, it is that the conception of a market in this inclusive sense—an aggregate of productive activities tied together by trade—carries with it the notion that there must be some sort of balance, that different productive activities must be proportioned one to another.

Expanding Markets Important for Centuries

IT is dangerous to assign to any single factor the leading role in that continuing economic revolution which has taken the modern world so far away from the world of a few hundred years ago. But is there any other factor which has a better claim to that role than the persisting search for markets? No other hypothesis so well unites economic history and economic theory. The industrial revolution of the eighteenth century has come to be generally regarded, not as a cataclysm brought about by certain inspired improvements in industrial technique, but as a series of changes related in an orderly way to prior changes in industrial organization and to the enlargement of markets. It is sometimes said, however, that while in the Middle Ages and in the early modern period industry was the servant of commerce, since the rise of "industrial capitalism" the relation has been reversed, commerce being now merely an agent of industry. If this means that the finding of markets is one of the tasks of modern industry it is true. If it means that industry imposes its will upon the market, that whereas formerly the things which were produced were the things which could be sold, now the things which have to be sold are the things that are produced, it is not true.

The great change, I imagine, is in the new importance which the potential market has in the planning and management of large industries. The search for markets is not a matter of disposing of a surplus product, but of finding an outlet for a potential product. Nor is it wholly a matter of multiplying profits by multiplying sales; it is partly a matter of augmenting profits by reducing costs.

Although the initial displacement may be considerable and the repercussions upon particular industrials unfavorable, the enlarging of the market for any one commodity, produced under conditions of increasing returns, generally has the net effect of enlarging the market for other commodities.

EXHIBITION HALL of the German Machine Tool Builders' Association at the Leipzig Trade Fair, Which Is to Be Held at Leipzig, Germany, March 3 to 13, 1929. This building has about 225,000 sq. ft. of floor space and is served by railroad spurs and three large overhead cranes. Machines of a wide variety of sizes and capacities will be shown, most of them under power. The display of machinery, iron and steel and building materials at the fair will include some 2000 exhibits. Twenty-four countries, including the United States, will show products. American offices of the Leipzig Trade Fair are at 11 West Forty-second Street, New York

Pure Manganese Makes Interesting Alloys

British and Americans Prepare 99.99 Per Cent Metal—Carbon-Free Alloys Much Tougher Than the Corresponding Low-Carbon Manganese Steels

IN a research into the alloys of iron and manganese under way at the Bureau of Metallurgical Research, Carnegie Institute of Technology, Pittsburgh, manganese metal and iron-manganese alloys of unusual purity have been prepared. Manganese steels are, of course, well known, but in commercial castings the higher the manganese the higher is the carbon. To ascertain whether other valuable alloys existed in the range between 1 and 20 per cent it was necessary to provide some manganese metal of unusual purity.

Commercial metal, produced by electric furnace proc-

to sublime is the purest, samples analyzing *nil* for silicon, aluminum, iron and phosphorus, a trace of sulphur, and 0.003 to 0.012 of nitrogen. Typical analyses of samples secured in this manner by Miss Gayler are as follows:

Silicon	0.002 to 0.044	per cent
Aluminum	Trace to 0.035	
Iron	0.003 to 0.067	
Sulphur	Trace to 0.032	
Phosphorus	Under 0.001 to 0.005	
Nitrogen	0.003 to 0.012	
Manganese	99.991 to 99.8	(by difference)

The Pittsburgh scientists report that a single distillation of the 94 per cent commercial grade gave a product with 0.009 per cent carbon and traces of iron, aluminum and silicon. A photograph of a sample of this metal is reproduced.

Miss Gayler finds that the 99.99 per cent manganese melts at 1244 deg. C. (accurate to within 3 degrees, plus or

esses or by silicon reduction, has been available in three grades at least since 1919, ranging from 92 to 97 per cent manganese. Silicon and carbon in these materials are less than 1 per cent and 0.25 per cent respectively, and iron makes up the difference. Manganese produced commercially by aluminum reduction has less than 0.10 per cent carbon, but the manganese analyzes only 96 to 98, the balance being mostly iron and silicon in equal parts. Evidently a much purer metal is desirable for scientific investigation. It is possible to make manganese 99.3 per cent pure by aluminothermic reduction of Mn_2O_3 in an alumina crucible, but since the aluminum powder used for reduction always contains silicon and iron, these metals enter the final product, together with a variable amount of aluminum (which must be used in slight excess).

Consequently Drs. F. M. Walters, Jr., V. N. Krivobok and J. B. Friauf, the Pittsburgh investigators, turned to the vacuum distillation method described by Marie L. V. Gayler before the (British) Iron and Steel Institute on May 5, 1927. The retort is shown in the sketch. It is placed within the coil of a high-frequency induction furnace, exhausted by a vacuum pump to less than 1 mm. pressure, and alternating currents sent through the coil until the electrical currents induced in the crude manganese have heated it slightly above the melting point. The manganese vapor arising slowly from the melt is condensed in the cooler prolongation of the crucible, and the process continued until about half the charge had been so distilled. The first metal

minus). She also finds four thermal changes, representing transformations in the solid, as follows:

On Heating	On Cooling
1,188 deg. C.	1,195 deg. C.
1,043	1,005
744	740
740	681

It is silvery gray; brittle and hard enough to scratch glass and does not tarnish readily in air. The lower transformation points are probably associated with some change in crystal structure; at any rate a cooling ingot of manganese develops numerous cracks and fissures at about 700 deg C. The presence of impurities has marked effect on this shrinkage. Manganese melted under nitrogen also absorbs as much as 2.1 per cent of the gas, which forms a bluish gray micro-constituent.

Pure manganese prepared at Pittsburgh has been used in the manufacture of iron-manganese alloys, melted in vacuum, and ranging up to 19 per cent manganese and 0.06

per cent carbon. A preliminary statement regarding the properties of these alloys was made at the open meeting of the Metallurgical Advisory Board, Oct. 19. The alloys are remarkably tough when manganese is over 6 per cent. Hardness also increases with the manganese up to at least 10 per cent, and is practically independent of heat treatment. Certain interesting abnormalities in the transformation and recrystallization temperatures have also been

noted. Little carbon penetrates the highest manganese alloys during case hardening. Twenty per cent manganese irons are also much softer than the 10 per cent alloys. Drs. Walters, Krivobok and Friauf find the hardness of their alloys agrees generally with that found some time ago for corresponding low-carbon manganese steels by Sir Robert Hadfield; however, Hadfield's steels were reported to be brittle.

A New Measure of Industrial Efficiency

Production Gaged Per 1000 Factory Man-Hours Worked—Wide Variations Shown, With High Rating for Smaller Plants

A NEW measure of industrial efficiency—1000 man-hours—was described in a joint paper by L. P. Alford, vice-president Ronald Press Co., New York, and J. E. Hannum, mechanical engineer, presented at the annual meeting of the American Society of Mechanical Engineers at New York, Dec. 5. This mensural unit, called the "kilo man-hour" for convenience, shows a surprising variation in output for the same amount of labor. A survey of 100 industries showed a range in the value of product per 1000 factory man-hours from \$10,870 down to \$548—a ratio of 19 to 1.

Wide variations were also found among companies in the same industries. For example, in terms of physical production the ratio of maximum to minimum output per kilo man-hour in the manufactured gas industry was 40 to 1. In gray iron castings it was 16 to 1; in iron and steel tubing, 7 to 1; in steel fabrication, which showed the narrowest spread, 1.54 to 1.

A surprising disclosure is that smaller companies, in many instances, show higher physical production per kilo man-hour than larger organizations in the same industry. This high production per hour, says the paper, may be a reason for the persistence of the small plant in spite of consolidations and mergers. It was found that the smallest company has a higher rate of production than the largest company in 35 industries. The reverse was found true in 18 industries.

From the kilo man-hour, the paper states, numerous factors of industrial operation can be developed, among which are the following:

Factor	How Expressed
Productivity	Physical volume of product per kilo man-hour
Labor permanence	Number of workers employed per kilo man-hour
Fixed capital investment:	
Buildings	Investment in dollars per kilo man-hour, or Square feet of floor area per kilo man-hour
Machinery	Investment in dollars per kilo man-hour
Primary power	Horsepower utilized per kilo man-hour
Industrial accidents:	
Frequency	Number of lost-time accidents per kilo man-hour
Severity	Number of working hours lost per 1000 kilo man-hours
Costs:	
Wages	Dollars per kilo man-hour
Material cost	
Prime cost	
Overhead charges	
Manufacturing cost	
Profit:	
Manufacturing	Dollars per kilo man-hour
Net	
Selling price	Dollars per kilo man-hour

The paper was confined to a substantiation of the method and 85 tables, covering different groups of industries analyzed by the new method. The findings of the authors were submitted as a basis for further development. In conclusion they recommend that man-hours of labor be reported in the United States census, so that their method of measuring the efficiency of industries may be generally used.

In discussing the paper Laurence H. Sloan, managing editor Standard Statistics Co., Inc., New York, said that reporting corporate results—volumes, values, profits, etc.—in terms of kilo man-hours would revolutionize the aspect of business that has to do with appraising financial risk. Bankers, careful investors and conscientious security analysts would go beyond mere welcome of such data; it is a safe assumption, he stated, that they would do anything within reason to obtain them.

Physical Volume of Production per 1000 Factory Man-Hours

Industries	Number of Companies	Number of Employees	Number of Factory Man-Hours Worked	Production Rate per 1000 Factory Man-Hours
Iron and steel industry	36	48,889	138,712,045	37.5 gross tons
Fabrication of steel	6	3,004	8,065,790	45.15 gross tons
Skelp, plates and sheets	8	8,634	23,637,192	56.5 gross tons
Structural shapes	6	3,388	9,654,736	32.8 gross tons
Tubing	5	8,062	21,668,941	46.2 gross tons
Machine-building and metal-working industries	224	172,308	414,439,963	10.6 tons
Agricultural implements	5	2,677	6,650,821	16.65 tons
Automobiles	12	151,447	382,211,176	9.08 cars
Automobile parts	5	1,367	3,630,696	12.85 tons
Boilers and tanks	10	4,064	10,079,771	12.05 tons
Bolts, nuts, and rivets	6	4,419	10,895,000	16.60 tons
Brass, bronze, and copper	14	23,510	61,658,572	8.15 tons
Cast-iron enameled ware	5	8,664	20,423,347	8.08 tons
Electric machinery apparatus and supplies	8	14,777	36,053,558	6.03 tons
Engines, turbines, and pumps	5	2,471	6,162,638	3.17 tons
Forgings	11	5,260	12,936,999	16.64 tons
Gray-iron castings	16	9,409	19,167,215	14.05 tons
Hardware	15	8,164	20,008,959	14.20 tons
Hoisting and conveying machinery	5	2,643	6,491,829	7.46 tons
Machine tools	8	2,276	5,308,719	2.70 tons
Malleable-iron castings	11	4,107	9,563,424	6.92 tons
Non-ferrous castings	12	4,170	10,037,141	6.41 tons
Oil-well equipment	5	2,035	5,177,482	7.80 tons
Railroad accessories	13	15,679	36,205,412	15.50 tons
Sheet-metal products	10	8,261	20,566,387	17.30 tons
Special machinery	8	3,098	4,801,704	5.15 tons
Springs	7	1,684	4,393,941	13.50 tons
Steel castings	15	8,485	21,803,482	14.95 tons
Valves and fittings	13	10,215	21,260,800	7.00 tons
Wire products	10	12,143	30,904,117	8.71 tons

Blast Furnace Metal for Castings

Can the Blast Furnace Compete with the Pipe Foundry?—Analysis of Conditions and Costs Involved

BY DAVID BAKER*

IN THE IRON AGE of July 22, 1920, is an interesting account of the first successful attempt at iron making in this country, in Massachusetts. From it we learn that the first casting made in America was an iron pot weighing 2 lb. 13 oz., its capacity being given as one quart less one gill. The inside measurements were 4.5 in. wide by 4.5 in. deep. Under date of March 15, 1647, Robert Child, who was connected with the works, wrote to John Winthrop, Jr., then in Connecticut: "We have cast this winter some tuns of pots, likewise mortors, stoves and skellets."

On Aug. 4, 1648, Governor Winthrop wrote his son that "the iron works goeth on with hope and now yields about seven tuns per week." All these castings were from metal direct from the blast furnace.

I presume there is not a blast furnace manager in this country who has not made it a practice to produce at the furnace a certain number of castings required about the plant for replacements. The usual practice is either to divert from the main runner the metal required to fill the molds or to arrange for filling a small ladle at casting time, which is poured into the flasks by means of a small electric or hand crane. In such cases care is taken to choose the right kind of iron at the time when it is flowing in sufficient volume. The writer remembers seeing in 1886 a whole set of furnace columns and mantel cast at the Paxton Furnaces, near Harrisburg. These were cast in the pig bed for use in the reconstruction of one of the furnaces.

Emergency Practice Becoming Regular

Furnace-made castings have been resorted to from time immemorial in case of emergencies at the blast furnace, developing into a regular practice at most plants for certain castings, on account of the saving in time and cost. The question naturally arises: What economy may be secured by casting direct from the blast furnace as compared with casting the pig in a machine and selling it to the foundry, with the usual rehandling and remelting?

If we assume it possible to dispose of the entire output of a blast furnace to a foundry conveniently located, delivering the product in ladles, the furnace would still require the pig machine to handle Sunday iron and off casts. Hence there would be no saving in the investment; but, as the machine would not need manning all the time, there would be some saving in operating labor and a marked reduction in the cost of upkeep.

In considering this subject let us take a merchant furnace of 250 to 300 tons daily output, for stacks of this capacity are having hard sledding under present conditions. In addition, it is easier to find foundries whose daily melt is up to that figure.

Two Shifts a Day in Foundry

As to the amount of metal which could be absorbed regularly by a foundry under the assumed conditions, let us stipulate that the foundry change its practice of operat-

ing with one crew on day shift, and operate with two 10-hr. shifts. If the objection is made that that is impracticable, we need only refer to English practice, where one may see large foundries operated in this way; for instance, Stanton Iron Works Co., Ltd., which manufactures de Lavaud and sand-cast pipe.

The next phase of the problem, assuming that metal direct from the blast furnace may be made suitable for the production of gray iron castings of standard strength and soundness, is—what percentage of such iron could the furnace under discussion be expected to produce? In other words, can a furnace be kept on grade? Good average practice on basic iron in a month's run from such a stack may be put at 95 per cent and I am sure many furnacemen can show that for a year's run.

Foundry Equipment Savings

Let us now look at the molten iron from the standpoint of foundry costs. If 100 per cent of the hot metal for this shop may be secured direct from the blast furnace, the saving to the foundry would be the cost of remelting in the cupola and the cost of unloading and rehandling the pig in the foundry yard. To this should be added a lower overhead due to reduced investment in cupolas and the larger item, reduced outlay for the foundry equipment, as the plant would be operated night-and-day shifts against the present standard single-shift practice that obtains in this country. This would have an important bearing on the cost of operation, other things being equal. It is apparent in rolling mill costs, when, owing to reduced orders, it is necessary to operate single shifts instead of double.

The saving in the investment can be visualized if one considers the reverse condition, the increase of equipment required to enable a plant to produce, on day shifts only, what is usual with night-and-day operation. We are so accustomed to foundries operating on day shifts only that probably the possible economies obtainable by double-shift operation have not been considered by those with capital in the industry.

In case of double-shift operation, the cupolas are in blast continuously until necessary to blow down for repairs, just as was done in Bessemer steel practice, when all the iron was delivered in pig form from the blast furnace. This means a saving in fuel, refractory material and labor.

Unit Costs Tied Up with Quantity

The cost of melting pig in the cupola depends largely on the tonnage melted per day. In a foundry melting a large tonnage the costs may be as low as \$4 a gross ton, including handling and all overhead, while even a large shop may find these figures read \$10 a ton when not running full. A managing director of a large English foundry placed this average figure at \$4.85 a gross ton for his shop. In this discussion I think a fair figure would be \$5 a gross ton of pig charged.

If now we assume that the foundry is arranged for operation in double shifts on metal direct from the blast furnace, and that 95 per cent of that iron is suitable, we

*Consulting engineer, 1011 Chestnut Street, Philadelphia.

probably would find it advisable to give the employees of the foundry Saturday night, Sunday and Sunday night off. That means operating 11 shifts a week. From a blast furnace production of 2100 tons a week, as in the case we are considering, we would find the following disposition of furnace production: 95 per cent of 2100 = 1995 tons, of which the foundry would use as direct metal 11/14 or 1567 tons, leaving 533 tons of iron—some of it a little too high or too low in silicon—which could be sold as basic iron.

The small percentage of high-sulphur pig made would best be remelted in the blast furnace, along with the gates and sprues from the foundry. This would involve no expenditure of fuel if the foundry made the usual yield of marketable product, the excess heat of the furnace hearth taking care of this tonnage without difficulty.

Never Undertaken Commercially

Use of direct blast furnace metal for the production of castings is not a new proposal, but why has it never been undertaken on a commercial basis? In other words, why has not some furnace company started a pipe foundry and operated the shop with direct metal? I mention a pipe foundry because that industry is a large consumer of pig iron and the business is usually obtained in fairly large orders. If a canvass is made of blast furnace managers, probably a small percentage would say such a scheme is practicable; while among foundry managers it would be difficult to find any to approve.

This has been the writer's experience in this country, but in England we found that the process was considered more feasible.

The difficulty in the minds of the foundrymen is the almost universal belief that the cupola purifies the iron by remelting it. There is also a decided opinion that a mixture of several kinds of iron is necessary, to produce satisfactory pipe. The purifying effect claimed for the cupola is a very doubtful one.

Advantage from Mixing Irons

There is a mixing possible in remelting iron, not in the cupola itself but as the iron is tapped into the ladle, which is more effective when a forehearth is provided with the cupola. It is a commercial advantage to be able to utilize several kinds of pig iron and scrap in the foundry production. But it must not be forgotten that in this remelting in the cupola a large percentage of the sulphur in the coke goes into the molten bath, and sulphur is a hardener and tends to produce blowholes in the castings.

As an illustration of the kind of iron found satisfactory in certain cast pipe, the following analysis taken from a report by the Underwriters' Laboratories is interesting. "The results of 35 analyses selected at random from the records of a large foundry over a period of seven months were as follows:

	Silicon Per Cent	Sulphur, Per Cent
Average	2.53	0.077
Maximum	2.73	0.114
Minimum	2.35	0.060

In this case the iron went into the production of de Lavaud pipe, and iron with silicon as shown was chosen to prevent the metal chilling white when cast against the metallic mold. Had direct blast furnace metal been used, iron much lower in silicon would have served as well, provided the sulphur had been kept down to the usual blast furnace practice—0.03 per cent and under.

This iron with the lower silicon would have cost much less to make. Suppose, for example, the average silicon of 1 per cent in the direct metal were found satisfactory with the lower sulphur in place of 2.53 per cent used. To get the 1.50 per cent additional silicon would require an expenditure of from 250 to 300 lb. of coke per ton of pig in Eastern merchant furnace practice, which may mean at some plants an additional cost of \$1 per ton of product. If we take into consideration the loss of output owing to the lighter burden carried on the furnace, a spread of \$4

and even more per ton may be incurred at some furnaces, to secure the higher silicon.

Qualities Required by Foundries

The claim is made in a patent issued to David F. Baker, April 21, 1925, No. 1,534,561, that the low-silicon low-sulphur iron direct from the blast furnace has the qualities sought for in foundry practice, when a much higher silicon cold pig is now specified for that purpose; but the effect of the silicon is nullified to a marked degree by the large increase in the sulphur content during melting in the cupola. The claim is made that the reason all efforts so far to put the full output of a blast furnace into castings for the market other than ingot molds has been a failure is due both to the foundryman and the furnace manager making the error of using iron for the purpose made in too hot a furnace; that is, with a too high silicon content.

This iron is too "rich" as it comes from the blast furnace; it has too much "kish" and graphitic carbon, and the castings produced are unsound and also too soft. It seems unreasonable to some that metal direct from the blast furnace should make sound castings where the sections are thin.

They claim that, because the iron is reduced from the ore in one process, it needs further treatment to produce satisfactory gray iron castings. Carrying this argument to the open-hearth steel process, one would expect steel made by the "pig and ore process" to be less satisfactory, say in wire manufacture, than steel made by the "pig and scrap process," but this is not borne out in practice.

Fluid Iron Can Be Made

I think every blast furnace manager has frequently made iron that was fluid enough for the successful production of stove plate castings. That iron, it is claimed, can be regularly produced up to 95 per cent of the total output.

If this is so, and we get back to the earliest furnace and foundry practice in this country, it would appear that a low-silicon, low-sulphur iron suitable for casting direct could be produced for at least \$4 a ton less than iron run as specified for making de Lavaud pipe. If now we add to this figure the \$5 shown as saved with the combination of furnace and foundry previously described, there is a total of \$9 a ton to be picked up by a blast furnace going into pipe production, or by a blast furnace and iron foundry uniting and using blast furnace metal direct.

Here is an opportunity for the merchant furnace now idle, or operating at a loss, to eliminate the red figures in the ledger; that is, to reclaim an investment that is now on the way to be scrapped.

Heat Treating With Gas Gains

Approximately twice as much manufactured and natural gas is now consumed for industrial purposes as is sold for domestic uses. According to figures issued by Peoples Gas Light & Coke Co., Chicago, the metal trades are the largest industrial users and the consumption is increasing rapidly. That company in 1927 sold 1,800,000,000 cu. ft. to such plants as agricultural implement shops, non-ferrous foundries and railroad equipment manufacturers (to list only the three largest groups), while in 1928 the total was slightly over two billion, an increase of 11.5 per cent.

Steel treatment is a large consumer of gas everywhere. Larger amounts of money are apparently being invested in single pieces of gas-burning equipment by the metal trades than ever before. Several Chicago plants are reported to have purchased furnaces costing more than \$20,000; the largest recently installed cost \$65,000. This record of high investment in a year of guarded spending is evidence that important economies are anticipated. One battery of four gas-fired carbonizers is reported to have effected savings at the rate of \$45,000 a year.

Research Is First Need in Marketing

Sales Activity Based on Adequate Marketing Data May Be
Controlled as Accurately as Production

BY WILLARD E. FREELAND*

WE are in a period of great prosperity but there are many manufacturing enterprises which are not prosperous. Usually they have failed to keep in step with modern marketing, merchandising and advertising. Now they have a lot of lost ground to recover. There is no time for slow convalescence. The problem becomes one of financing extraordinary expense. The needed expenditure could not possibly be thrown into current costs without pricing the product out of the market. The cost must be amortized over a series of years. Some companies which need this treatment are financially sound and by foregoing dividends and cutting into surplus could finance the operation. Others, however, must borrow. The old fashioned banker would not think of lending money upon anything so intangible as a marketing scheme, but we are beginning to have a new type of banker who can see the wisdom of such an operation. Usually such a banker has a staff who can give able counsel and follow through the effort to the benefit of all concerned. Within the next 10 years marketing is going to demand the same banking support that production has long had.

Market Research Indispensable

Many marketing managers have problems because they will not interest themselves in the subject of commercial or marketing research. They are content to base policies and methods upon opinion, largely inbred opinion, rather than find the facts of their own business. Research is of such fundamental value to a business that the resistance to its introduction is almost incomprehensible to one familiar with its achievements. Its value to a small business is relatively as great as it is to a big business. Few businesses are so small that they cannot support at least one man on this work.

The sales forecast in these days of company budgets underlies the plans of every function of a business. The sales forecast has become a necessity for management planning and control of industry. A plea should be made for a larger development of statistical treatment of economic data as a measuring stick for whatever quota methods may be used, whether they be estimates by the sales force, analysis of past sales, or something else. It is just as important to study the business which you are not getting out of a territory as the business you are getting and the statistical measurement of economic data is invaluable for this purpose.

Another problem worth studying is the value of merchandising. This function intervenes between sales and production and serves as a real coordinator of their requirements. It is primarily concerned with the character of products, control of finished goods inventories, prices and similar matters which call for the service of men of special aptitudes and training. It is a particularly useful department of a business which has a long and varied line of products. A study of its usefulness is one of the most profitable things that a business manager can undertake for the work goes on steadily whether properly organized or not.

Marketing managers say much less about marketing or

sales control than production managers about production control. They seem not to recognize that it is important to secure a control of marketing work. In many instances they have not had enough research to discover what they are or should be trying to control. Written marketing plans with quantity and time schedules and expense budgets are rarely found. It will be a big job to catch up with the 20 years' lead of production in this matter of control. There will continue to be a high turnover of sales managers until a type is established who believes in and practice research, planning and control in marketing.

What constitutes a proper sales territory? Shall territories be built upon business which ought to be had or upon business now had? Should a policy of intensive selling be used and territories cut down, or should selective selling be adopted and territories made larger? As it becomes better developed and understood, the statistical valuation will become the prime basis for establishing territories in place of past sales or physical load estimates of uncontrolled sales work.

A sound quota is needed as the basis for plans and budgets, for control standards, and possibly for a basis of compensation. Sales quotas are constantly set up which do not take into account the many forecasts of business conditions, or the estimated effect of planned sales campaigns, and which have no element of flexibility incorporated therein.

Routing of Salesmen

Routing of salesmen, frequency of calls upon customers and classification of accounts are related problems which demand attention. It appears that accounts and prospects must be classified if we are to determine the profitable frequency of all so that in turn men can properly be routed. Many do not believe in controlled routing of salesmen, but good research and cost accounting in marketing disclose conditions that almost demand it. There should be an element of flexibility in routing to meet emergencies, but not enough to break down central control.

Cost Accounting New in Field

Too many sales managers do not realize that cost accounting is one of the real problems in which progressive chief executives are vitally interested. Cost accounting in this field is hardly out of the primary stage. Where cost accounting in marketing has been attempted, the disclosures have often been quite disturbing, even though stimulative.

The actual costs of field work, advertising, sales promotion, etc., should be known. Sometimes rather good figures on these activities seem to be available, but do they provide a real basis for genuine control? Because they are historical, because they are usually total instead of element costs, and because they do not show the effect of various activities upon profits, they do not give a foundation for effective marketing control. The costs of selling varying items or classes of product should be known as an element of price setting. Cost accounting would provide a true picture of profits by salesmen to use as one of the bases of better compensation methods. Scien-

Many Shop Uses for Chrome Plate

Mechanical Applications Requiring Hardness and Resistance to Abrasion Reviewed at Annual Meeting of Mechanical Engineers

IN a paper on the mechanical applications of chromium plating, presented at the annual meeting of the American Society of Mechanical Engineers, New York, Dec. 4, Dr. William Blum, chemist Bureau of Standards, Washington, pointed out that most applications depend either upon the resistance of the plating to tarnish, or upon its hardness and wear resistance. The paper was confined to the latter, in which uses, however, the protection against tarnish and corrosion furnished by the chromium is an added, though secondary, advantage. The value of chromium for any given application may depend not only upon its hardness, but upon other properties, such as tensile strength, ductility, thermal expansivity, density, melting point, electrical conductivity, adherence, and interfacial relations in contact with liquids or solids, data on which are included in the paper.

Chromium Plating Valuable on Measuring Devices

"Chromium plating has proved especially valuable on measuring devices," said Dr. Blum, "because its resistance to abrasion decreases the tendency for change in dimensions, or for any obliteration of graduation marks. The latter factor justifies its use on linear scales, verniers, micrometers, tapes, etc. It has been more extensively and more successfully applied upon plug gages than on any other measuring devices." Of numerous replies to a questionnaire, it was said that all were favorable except one, and the life of the plated gages in service was estimated to be from three to 10 times that of the unplated gages.

"Although it is possible with proper control of the plating process to deposit upon a gage exactly the requisite thickness of chromium, and to use the gage without subsequent lapping, experience has led in almost every case to the deposition of a somewhat thicker coating, the excess of which is then ground or lapped off. Data received include thicknesses from 0.0002 in. to 0.004 in. The thickest coatings were applied for bringing greatly undersized gages to dimension.

"In general the chromium coating should be thick enough so that it will not be penetrated when the gage is worn down to its lower wear limit. It is then a simple matter to strip off the chromium (by a reverse current in a sodium hydroxide solution) and to replating to the desired dimension. While of course the minimum thickness required will depend upon the dimensions of the gage before plating, there is no evident advantage in applying more than 0.001 in. of chromium, and for many purposes half that thickness is adequate.

"Chromium-plated thread gages are now used in several plants, but there is still much uncertainty and skepticism regarding their reliability," said Dr. Blum. "This doubt arises from the difficulty of depositing chromium uniformly upon the surface of the threads. In any plating process the deposit is always thinner in a depression than upon a projection, and this difference is accentuated by the notoriously poor 'throwing power' of the chromium-plating bath. As a result of the uneven distribution of chromium upon the threads, not only the diameter of the gage, but also the thread angle is altered.

"Experiments with thread gages, show that when any appreciable thickness of chromium is applied, the changes in pitch diameter and major diameter and in the included angle are likely to be greater than the normal tolerances for such dimensions. It will therefore usually be necessary to regrind the gages after plating, unless they have been previously so ground as to allow for the uneven distribution of the chromium. The latter procedure is probably feasible if a large number of similar gages are being made and plated.

"Data obtained regarding ring and snap gages indicate that chromium plating increases their life to about the same extent as it does on plug gages. It may safely be stated, therefore, that chromium plating will prove valuable upon any measuring device which is subject to abrasive wear in service, provided the shape is such that the chromium can be applied with reasonable uniformity."

Plated Dies for Forming Metals

Information received relative to drawing dies was said to show an apparent contradiction in that dies and mandrels used for tube drawing were generally reported as satisfactory, while wire-drawing dies were usually unsatisfactory. "The latter were reported as failing through flaking or peeling of the chromium, and subsequent scratching of the wires," said Dr. Blum. "The only obvious explanation of this discrepancy is that the apertures in the wire dies are usually much smaller and therefore more difficult to plate uniformly than those in the tube dies. In one plant a chromium-plated wire-stranding die has yielded over twice the normal service.

"In connection with the manufacture of hot-rolled seamless steel tubes, the successful use of chromium-plated drift balls was reported. This application no doubt rests partly upon the resistance of the chromium to oxidation at the elevated temperatures employed, as well as upon its resistance to abrasion.

"Very favorable reports were received regarding the value of chromium plating upon dies used for forming sheet steel and brass. In some cases the life of the dies is increased up to eight times the normal service. One special advantage observed with the chromium-plated surface is that the metal does not stick to it as much as to steel. It is significant that the thickness of the chromium coating on these dies is usually less than 0.0005 in."

In those cases where the metal is formed, or a design produced upon it, as in stamping dies, by a sudden impact instead of by a steadily applied pressure, the chromium coating was said to be of doubtful value. "This is because under such severe conditions the chromium tends to flake or chip, probably because the underlying metal, even when it is case-hardened, is at least temporarily deformed," said Dr. Blum. "In such cases success is more probable with thin than with thick coatings. A few experiments, not completed, upon coinage dies at the United States Mint in Philadelphia, illustrate this difference. Those dies with a coating of 0.0005 in. or more of chromium all failed in a comparatively short time. Those with only

0.0002 in. of chromium lasted slightly longer than the steel dies, and yielded consistently sharper impressions.

Applied to Hot Forging and Other Dies

"One plant reported favorable results with dies used in hot forging. If this experience is confirmed, the improvement may be due at least as much to the protection furnished by the chromium against oxidation as against abrasion. This application is somewhat similar to the use of chromium on glass molds that has been reported both in Germany and in America.

"Both spinning and burnishing tools may be classified as forming devices, even though the action of the latter is confined to the surface. Several favorable reports were received upon both of these applications of chromium. One of the most successful applications is upon dies used for molding plastic materials such as rubber, bakelite, ceramic clays, etc."

It was said that no definite information has been obtained regarding the use of chromium upon steel rolls employed for either hot or cold rolling of metals. "The great size and weight of the rolls used in many operations render their plating somewhat difficult," said Dr. Blum. "This application at least warrants careful study. Rolls used for finishing sheet metal would almost certainly have their life increased by plating."

Chromium Plated Cutting Tools

Data received regarding chromium on tools used for cutting metals were said to be more variable and less favorable than those for any other uses. "The general difficulty may be summed up by saying that if the chromium is thick enough at or near the cutting edge to exhibit its great hardness, it is likely to fracture, and if too thin, it soon wears off the edge and offers little advantage," he said.

"Nevertheless a sufficient number of successful applications were reported to show that, for some purposes at least, chromium deserves careful consideration. The value of chromium is no doubt affected by such factors as the angle and type of the cutting edge, the speed of cutting, and the material being cut. In at least a few cases favorable results have been obtained by plating only one side of the tool with a fairly thick chromium deposit. The tool can then be ground repeatedly upon the steel side, thus always leaving a cutting edge of chromium.

"Blanking dies furnish a good illustration of the difficulties with chromium plating, especially when they are used on hard metals such as steel. The impact is such that any fairly thick deposit is likely to flake, and thin deposits usually add but little to the service. On the other hand, such tools as milling cutters, reamers, drills, and taps have frequently shown a material increase in service after plating. Even then, however, the results are likely to be erratic. The most consistent gains are obtained when cutting such substances as slate, asbestos board, and bakelite, which materials, though commonly referred to as 'soft,' cause rapid wear of steel tools.

"The experience with saws of various types is like that with other cutting tools. If a thick coating is applied there is a marked tendency for the formation of nodules or 'trees' upon the points of the teeth. These dull the points, and if, as usually occurs, they break off in service

they leave the teeth rough and irregular. For such articles it is therefore preferable to use relatively thin coatings. This conclusion is confirmed by the results reported for hack saws. Even with the thinner coatings they were not so satisfactory for cutting steel as for materials such as slate and asbestos.

"Files are somewhat similar to saws, in that any appreciable thickness of chromium tends to dull the files. It was reported by several persons that chromium-plated files show much less tendency to clog in use than unplated files. Whenever a material tends to fill the files, the use of light chromium coatings may be justified, even though the useful life of the file may not be greatly increased. In some cases, however, an increase to double the original service was obtained.

"A few reports upon woodworking tools, including saws, chisels, and lathe tools, show that their life is very greatly increased by the use of chromium coatings. Results with rock drills are still uncertain.

Few Applications to Machine Parts

"In spite of the apparently obvious applicability of chromium upon all parts of machinery that are subject to wear in service, such use is still far from being a general or even a preferred practice," said Dr. Blum. "The failure to adopt chromium for such purposes may be due to various causes, including the size or inaccessibility of many of the parts, and the fear that if the chromium should become detached from a bearing surface, the particles would serve as an abrasive and cause permanent injury to the mechanism. While the latter possibility warrants careful consideration and proper caution, the probability of its occurrence is not evident from the meager data available. These data, however, refer mostly to successful applications and furnish little or no evidence regarding many types of machinery upon which the chromium may have been tried and found wanting. If, as we suggested earlier in this paper, a lower coefficient of friction can be obtained and maintained on a chromium surface than on other metals, the use of chromium on bearing surfaces may prove beneficial. There is no justification, however, for assuming that the use of chromium will obviate the necessity for lubrication."

Not a Panacea for Wear

Successful application of chromium plating to automobile piston pins, gears for counting machines, Diesel engine piston rods and printing plates are outlined in the paper.

In conclusion, Dr. Blum said, in part:

"Chromium plating owes its application upon mechanical equipment primarily to its great hardness, as exhibited in its resistance to abrasion. The chief limitation in the use of chromium for such purposes is its extreme brittleness, which may cause it to crack and flake when deformed. . . . Chromium plating is not a panacea for wear. An everlasting tool or machine is as visionary as perpetual motion. Chromium plating has, however, solved many machine-shop problems, reduced costs of operation, and improved the quality of the products. When we recall that almost all this progress has been made in less than three years, there is good reason to hope and to believe that with the large number of investigators now at work on this subject, even greater results may be expected."

Symposium on Machine Tool Motor Drives

A SYMPOSIUM on motor application and control, presided over by E. F. DuBrul, general manager National Machine Tool Builders' Association, was a feature of the annual meeting of the American Society of Mechanical Engineers in New York.

The increased use of self-contained motor-driven lathes was emphasized by C. L. Cameron, Eastern representative Monarch Machine Tool Co., New York, in a paper on "Methods of Motor Application and Control on Lathes." The records of his company show production of upward of 90

per cent of the self-contained motor-driven lathes as compared to about 15 per cent 10 years ago.

"There has been a tendency among lathe builders, as well as builders of other machine tools, to recommend motors of far greater horsepower than is necessary for a given size of lathe," said Mr. Cameron in another part. "This over-motoring recommendation is the result either of ignorance on the part of the manufacturer or, more likely, of a desire to create in the mind of the buyer an inflated idea of the amount of power his machine is capable of handling."

Difficulties experienced because of a lack of standardization of motor sizes, armature shaft dimensions, motor bolt hole sizes, etc., were outlined by Mr. Cameron. Some of these difficulties are:

1. It is impossible to jig-drill and tap the motor plate.
2. It is necessary to fit each motor, lay off the holes, take the motor plate off the machine, drill and tap it, and then put it back again.
3. It is not possible to carry motor pulleys, sprockets, or sheave pulleys in stock, border and keywayed ready for use; each must be made up after the motor has been selected.
4. It is impossible to carry standard motors in stock. Frequently considerable delay is experienced waiting for customers to send certified prints and motor to the plant to be attached, entailing a loss of time and unnecessary freight expense.
5. Frequently customers neglect to have the proper starting apparatus sent at the same time with the motor, causing confusion and more delay and making it impossible properly to attach and inclose the wires between motor and starter.
6. It is almost impossible for lathe builders to consider the use of flange mounting due to the lack of standardization of frame sizes.

Best for Manufacturer to Provide Motor

"If the machine-tool manufacturer could include the motor and controller in his machine as a component unit without identity just as if it were a standard part of the machine, such as a speed gear case, the problem would be greatly simplified.

"As the range of motors used on lathes is between 2 and 15 hp., with probably 90 per cent of the motors of 7½ hp. and under, the manufacturer could carry in stock motors and starters of suitable voltage ready for instant application. Savings effected if this practice could be adopted would be greater than those which the users now think they make by buying their own motors, and, of course, these savings would be passed on to the users. Much time, expense and confusion would be saved, as everyone is familiar with the number of questions that arise when ordering a motor-driven machine, such as horsepower, voltage, speed, style of starter, switches, etc. These details have to be settled with every order that is taken when customers order their own motors.

"Wherever possible or practicable it is always advisable for the lathe manufacturer or the machine-tool manufacturer to mount the motor on the tool and do the necessary wiring. In this way the lathe can be tested out and operated under its own power before shipment to the user, and such wiring and motor application can be done at a lower cost by the tool manufacturer than by the user. This also shifts from the user to the manufacturer the responsibility of securing a perfect motor-drive application. There still remains the dual responsibility when the customer selects and purchases his own electrical equipment."

Generous use of anti-friction bearings throughout the headstock, quick-change gear box and apron was said to materially lessen the horsepower required to drive a lathe. The different types of driving motors for lathes, including the most prevalent, the constant-speed alternating-current motor, were briefly discussed. "The development of an a.c.

variable-speed constant-horsepower motor having at least six or eight speed changes with a motor of reasonable size and price would revolutionize the design of lathe headstocks, as well as many other classes of machine tools," said Mr. Cameron.

Motor Equipment for Precision Grinders

Development of motor drives in grinding machines was outlined by R. E. W. Harrison, engineering director Cincinnati Grinders, Inc., Cincinnati, in a paper on "Motor Drives for Precision Grinding Machines."

"It is obvious that the tendency is toward the elimination of the transmission elements," said Mr. Harrison. "However, while this is highly desirable because it has the virtue of simplicity, there are difficulties in the way of successful applications to grinding machines that do not obtain on other types of machine tools."

"The one element which is the most prolific source of difficulty in the way of successful grinding operations is vibration, and until it is possible for motor manufacturers to produce motors that are free from vibration, it is doubtful if the practice of mounting the motor directly on the grinding-wheel spindle will become general. Vibrations due to end movement of the armature shaft are comparatively rare, but vibrations due to lack of dynamic balance are, unfortunately, frequent.

"Machine-tool manufacturers and the users, of course, realize the difficulty which confronts the motor manufacturer, this difficulty being due to the nature of the materials which the motor manufacturer has to use to attain his results. However, it is only a matter of time before an armature will be produced which will have the virtue of permanently correct dynamic balance, and, providing that the motors can be kept within the present limits of size, it will be then only a very short time before practically all motor-driven grinding machines will be made with the main drive motor as an integral part of the wheel head."

In speaking of motor mountings, Mr. Harrison said: "Considerations of floor space, time taken to install, and the fetish of neatness of appearance have brought about the use of the barrel-type motor without feet, in which the motor is carried on a flanged mount in the side of the machine. This is undoubtedly the best looking arrangement yet devised, but it entails difficulties in servicing which have led a number of users to specify alternative methods of mounting." Of the variable-speed motors used extensively up to 3 hp. for work-rotation drive, it was pointed out that so far a speed range of 3 to 1 has been the only one practicable, but that electrical manufacturers are developing a motor with a 6 to 1 speed range."

Of "across-the-line" motors, Mr. Harrison said: "This type of motor is rapidly becoming more popular, and while it costs a little more than the standard type of a.c. motor, the control panel is cheaper and offsets this extra cost. The chief advantage is its simplicity, and it is felt that it is only a matter of time before the electrical power supply companies so arrange matters that all machine-tool equipment calling for motors up to 30 hp. will be fitted with motors of this type.

"At the present time many supply companies are opposed to the installation of across-the-line motors on account of the rush of current involved in starting up. However, with such a motor and a suitable transmission element, with an adequate factor of safety to take care of the torque involved in starting up the mechanism, the equipment represents the best combination which the user of today can buy."

F. E. Cardullo, chief engineer G. A. Gray Co., Cincinnati, contributed a comprehensive paper on "Motors for Planer Service," and J. H. Mansfield, chief engineer Greenlee Brothers & Co., Rockford, Ill., presented a paper on "The Application of Motors to Special Drilling and Tapping Machinery."

Hacksaw Blades of High-Speed Steel

Power Machine So Fitted Held to Be Most Efficient Cutting-Off Tool

BY EDWARD S. NORVELL*

METHODS of cutting metal by saws have changed several times during the past 20 years. Briefly, 20 years ago metal was most generally cut on a production basis by means of cold cutting-off machines, using solid-tooth, circular metal-cutting saws.

At the time of the World War the power hacksaw machine came into favor, because the initial cost of these machines was less than for a circular

inserted-tooth, circular metal-cutting blade with high-speed teeth, to keep up with the metal-cutting bandsaw.

First Use of High-Speed Steel Blades

These methods of cutting competed with each other from the end of the War until three years ago. In 1925 the genuine high-speed steel hacksaw blade was first put on the market. This blade has revolutionized all previous metal-sawing practice. With

cost of the machines. Therefore, more machines can be operated with less labor for the amount of money invested in sawing equipment.

5—High-speed steel hacksaw blades are highly standardized and a complete stock is carried by several supply houses in each industrial locality. Therefore, a user of a power hacksaw machine is never forced to stop work because he cannot immediately obtain blades for the machines, from the stock of a local source of supply.

A modern hacksaw machine combines the best qualities of a metal bandsaw machine with the best qualities of a circular sawing machine, as follows:

- a—Removes a fairly narrow kerf.
- b—It makes a smooth, straight cut.
- c—It requires a minimum amount of power.
- d—It requires a minimum amount of floor space.
- e—One man can handle several machines alone.
- f—The blades are heavy enough so that breakage is not a serious factor.
- g—The blades can be resharpened.
- h—The blades are heavy enough so that they will stand a heavy feed.
- j—The machines are simple and can be operated by any workman of ordinary intelligence.
- k—In case of accident, and where a blade is broken, the loss is not heavy.

THIS Power Saw Is Cutting 2-In. Round Forgings of Tough Vanadium Steel. The time taken was under 2½ min. to the piece and the average production exceeded 100 pieces for each saw

sawing machine, and because they could be operated with fewer attendants. In addition, blades could be changed quickly and a greater production was obtained from several power hacksaw machines than could be secured from the same amount of money and floor space invested in circular sawing machines.

The second stage in the development of metal cutting was the metal-cutting bandsaw machine. This machine was adopted by up-to-date metal-working plants, which threw out their circular cold sawing machines and power hacksaw machines, because the metal-cutting bandsaw machine was a more efficient tool. This was true since the blade cut continuously and there was no lost motion on the return stroke, and therefore it would cut more rapidly. In addition it was more economical, because none of the blade was wasted, because it removed a narrower kerf and because it required less power.

After the development of the metal-cutting bandsaw machine, the makers of cold sawing machines adopted an

it a power hacksaw machine held all the advantages of a narrow kerf and in addition obtained the new advantages of a rapid-cutting blade and a blade which would wear so much longer that it was more economical than any other previously known method of cutting off stock.

Modern, up-to-date power hacksaw machines, such as the Atkins No. 18, the Peerless universal shaping saw and the Racine shear-cut machine, offer any plant that works metal on a production basis a new combination, with high-speed steel hacksaw blades which will cut their metal economically, rapidly and straight.

It will pay any firm that is sawing metal on a production basis to put in one or more high-grade production power hacksaws, and use genuine high-speed steel blades. This type of equipment has the following advantages on most cutting-off operations:

- 1—The blade expense is low.
- 2—The cutting cost will be low.
- 3—The labor cost will be low.
- 4—The production for a given investment in machinery will be high per day, because of the low initial

Flow Meter Joints Welded

TO secure permanent tightness in the new design of indicating flow meter made by the Meriam Co., Cleveland, the joints between pipes, fittings and valves are welded. Atomic hydrogen welding, which has been described publicly a number of times in recent months, is the method used, but it is thought that the Meriam company's installation is the first commercial application of the new process in the Cleveland region.

The meter is designed for measuring air, gas, saturated or superheated steam, oils and other liquids at any temperature, vacuum or pressure. Operation depends upon the fact that the flow of the liquid or gas causes a loss of pressure along the pipe. An orifice-disk of Monel metal is placed in the pipe, and two small tubes are connected, one on each side of the disk. The difference in pressure is recorded by a mercury column, and the scale may be calibrated in cubic feet, barrels, pounds, gallons, or any desired other quantity per hour.

Steel Freight Rate Case Hearings Soon

Arguments May Be Presented Beginning in January—Many Briefs
Take Exception to Findings of Examiners on Mileage Scale

WASHINGTON, Dec. 11.—Arguments in the general steel rate structure case will probably be heard beginning in January. Replies to briefs of exceptions to the proposed report of Examiners Howard C. Faul and C. M. Bardwell are to be filed by not later than Dec. 31. The investigation, the most sweeping of the kind ever undertaken, covers all rates on manufactured iron and steel throughout Official Classification territory, and is being made under the Hoch-Smith resolution.

In their joint brief of exceptions to the proposed report, independent steel interests in the Chicago district protested against the proposed destination grouping. These interests included the Inland Steel Co., the Acme Steel Co., the Interstate Iron & Steel Co., Clayton Mark & Co., Joseph T. Ryerson & Son, Inc., the Crane Co., and the Northwestern Expanded Metal Co.

The examiners recommended that reasonable destination groups be permitted in connection with hauls of approximately 450 miles or over, but that reasonable destination groups be prohibited in connection with shorter hauls.

"This is equivalent to saying that reasonable destination groups to Illinois territory shall be prohibited from Chicago, but permitted from Pittsburgh, and from the context it would appear that this is the situation at which the distinction is deliberately aimed," said the brief. "We object with all the emphasis at our command to such unjust and gross discrimination, and respectfully insist that we are entitled to equal treatment with Pittsburgh. If reasonable destination groups are to be permitted we have as much right to enjoy them as has our huge competitor."

The Chicago district independents said that the examiners apparently condemned the existing destination groups in Illinois as not being in conformity with the requirements of the Jones & Laughlin decision. The contention was made that the present destination groups in Illinois are in all respects in compliance with that decision and that the commission has set its stamp of approval on these groups. It was urged that they should not be disturbed. The location of important competing lines and the observation of the long-and-short-haul rule was declared to compel the existing Illinois destination groups.

Deere & Co., implement makers, Moline, Ill., and the Chambers of Commerce of Rock Island, Ill., and Davenport, Iowa, asked for the adoption of rates on bars, plates and shapes,

minimum weight 80,000 lb., not in excess of 75 per cent of the scale in effect on iron and steel articles in carloads, minimum weight 36,000 lb. These interests in the Tri-Cities also proposed a scale of rates which was prepared on the basis of a minimum of 6c., suggested by the examiners, but extended on the basis of 12c. for 100 miles and 24c. to 400 miles. It was maintained that rarely, if ever, does the rate for 100 miles exceed 200 per cent of the rate for five miles and that the rate for 400 miles rarely, if ever, exceeds 200 per cent of the rate of 100 miles or 400 per cent of the minimum rate. The brief supported the contention of F. A. Ogden, traffic manager of the Jones & Laughlin Steel Corporation, who cited the bearing the case had on the Hoch-Smith resolution in that the farmer is the ultimate consumer of a large proportion of the steel manufactured, and that the freight rate on steel is a part of his cost.

Dealing with the competitive situation, the brief pointed out that manufacturers in the Tri-Cities of agricultural implements, railroad cars, and other iron and steel products are in competition with manufacturers of similar articles at Chicago, who receive their bars, plates and shapes on a switching rate or on a low rate of 5c. per 100 lb. from Gary, Ind., as contrasted with a rate of 17c. from Chicago to the Tri-Cities. The latter rate would be increased to 19c. under the proposed scale. It was estimated that the Tri-Cities annually receive 500,000 tons of steel from the Chicago district, its principal source of supply.

St. Louis Groups File Exceptions

Sixteen exceptions to the proposed report were made in a brief filed by the East Side Manufacturers' Association, the Granite City Steel Co., Granite City, Ill., and the Laclede Steel Co., St. Louis. The exceptions covered a wide range, reflecting criticism throughout. These interests offered a scale which, it was declared, would establish a proper level of rates and meet the requirements of the Hoch-Smith resolution, purposes which, the brief said, were not met in the proposed report.

In the course of its contentions, the brief pointed out that to Michigan the Central Freight Association fifth class scale is universally applied and that the application of the examiners' scale would seriously distort the rate relationships between the long haul and short haul shippers. There is no indication, the brief said, that such increased disadvantage even on what

tonnage may be moving could be absorbed to any extent whatever by the farther distant producing points. As illustrating the situation, the brief explained that the East St. Louis district at the present time must absorb 11.5c., 7.5c. and 6c., respectively, to compete with Cleveland, Chicago and Pittsburgh in the Detroit market, while, if the examiners' scale were applied, the difference would be 15.5c., 10c. and 9c., respectively. The rates from Cleveland, Chicago and Pittsburgh would be reduced from 23.5c. to 19.5c., 27.5c. to 25c. and 29c. to 26c., respectively. The rate from East St. Louis would remain 35c.

"This would mean an increased burden on the East St. Louis traffic of 80, 60 and 50c. per ton, respectively, a total differential to be absorbed of \$3.10, \$2 and \$1.80 per ton against our Cleveland, Chicago and Pittsburgh competitors," said the brief. "There is no foundation in fact for the conclusion that the traffic could move freely from the East St. Louis district to Detroit when the absorption necessary to move it against our controlling competitors at Cleveland is equal to 7.5 per cent of the market price of the material, and this is only one instance of the general situation which would be brought about by the application of the examiners' scale."

Syracuse Objects to Paying Higher Rate

The Chamber of Commerce, Syracuse, N. Y., took exception to the statement in the proposed report that the level of rates is of much less importance to shippers generally than is their relationships. The chamber said it is obvious that the receiver of iron and steel products is vitally interested in the level of rates and should be so considered.

Exception also was taken to the proposed basic scale of rates to the extent that the rates for longer hauls are unduly high in their relationships to rates for short hauls. It was contended that the rate of progression of the scale inflates the rates for hauls from 300 or more miles. The rate from Pittsburgh to Syracuse, it was pointed out, is now on a full fifth class basis at 28.5c. per 100 lb., while the recommended scale would result in a rate of 30c. when using 370 miles as the distance from Pittsburgh to Syracuse. In other words, it was added, it would make the recommended commodity rate higher than the class rate. The chamber expressed the view that the scale should be modified to a lower basis.

Although taking exception to three points in the examiners' report, the

Bethlehem Steel Co. expressed its recognition "of the thorough, capable and fair treatment which the examiners in their proposed report have given the many intricate and important problems involved in this proceedings."

Objections were made to the rates of progression (or road haul factors) in constructing the proposed scale; to the method proposed for constructing rates to and from New York, and to the proposals with reference to grouping.

Bethlehem Claims Unjust Relationships

The Bethlehem company said its dissatisfaction with the proposed scale does not relate to its general level, but is based solely on the unjust relationships which it will create. It was claimed it would prejudice short-haul traffic and prefer long-haul traffic. "It was contended that for relatively short hauls the rates would be padded apparently to protect carriers' revenues and that for hauls over 400 miles the rates would be increasingly depressed, apparently to stimulate long haul traffic. Regarding the terminal factor, the brief said that it is agreed that a minimum rate of 6c., of which 5.5c. is pure terminal factor, for hauls up to five miles will give more than full compensation for the total of all terminal service at both ends of hauls of all lengths. With the item of 5.5c. included in every rate, it was pointed out, terminal service is taken care of once and for all. There would be no terminal costs left over to be later "absorbed," it was declared.

Concerning road haul factors, the brief said the proposed scale would inflate Bethlehem's short haul rates and at the same time cut the rates of its long haul competitors so as to foster the latter's traffic as against the former's traffic. To produce a non-prejudicial scale, it was stated, there should be added to a proper minimum rate a way-train haul factor up to about 75 miles and thereafter a through train haul factor without further decrease. The ratio between the maximum or way-train factor and the minimum or through train factor, the brief maintained, should not be greater than as three is to two. The examiners, it was stated, have carried their maximum rate of progression through to 110 miles, for which it was asserted there is no justification. It was declared that it has the effect of forcing an extra cent into the scale at that point. The examiners also were declared to have tapered the rate of progression after 400 miles and it was added that there is no justification for this in transportation conditions. It has the effect, the brief said, of cutting the rates for long-haul traffic 1c. at 500 miles, 3c. at 600 miles, etc., a 2c. additional cut for each additional 100 miles.

If the proposed scale were approved, it was stated, shippers whose mills lie near their markets will be

penalized approximately 20c. per ton, while their long-haul competitors "will secure a subsidy of that amount and upward as their hauls increase." The brief incorporated a compromise scale which, it was said, would do justice to short haul shippers and still foster long haul traffic through the diminishing rate of progression which the examiners had in mind. At 70 miles, the brief said, the compromise scale would produce a rate of 11.5c., as compared with the rate of 11.5c. approved for that distance in another case.

As this 11c. rate is the key rate of the Pittsburgh-Valleys short haul structure, it was stated, the carriers' revenues from the great volume of short haul traffic in that territory would be slightly increased. For hauls up to 200 miles the compromise scale would increase the present rates for such distances in the middle and Western districts and slightly reduce the present rates in the East, which were said to be much higher than those enjoyed by Pittsburgh and Chicago shippers. As the combined in-got capacity of the middle and Western districts is over 46,000,000 gross tons, compared with only 8,000,000 tons in the Eastern district, said the brief, it is obvious that the general effect of the compromise would be to increase the carriers' revenues for hauls up to 200 miles.

Object to "Constructive Miles"

Objections to the recommendation that in making rates to New York City 10 constructive miles be added in the case of long hauls and an arbitrary of 5c. scaled down to nothing at 110 miles be added in the case of short hauls were similar to those made by other producers in the Philadelphia district. It was contended that the proposal to inflate the rates to New York had no basis and would be discriminatory. The proposal to add 10 constructive miles to the actual mileage to New Jersey rail termini, it was declared, cannot be justified as a distance adjustment. It was suggested that the floating of a car for, say, three miles in New York Harbor may well be less expensive than the switching of a car three miles in Pittsburgh or Chicago, particularly when capital costs as well as operating costs are considered. Furthermore, it was stated, the terminal factor of 5.5c. in the proposed scale is more than ample to cover actual terminal costs at cities where terminal costs are the highest. The simple and direct way to handle the situation without discrimination was said to be to add the same arbitrary charge to every rate, if any extra charge is deemed necessary.

Objection was made to the recommendation to accord the privilege of destination groups, upon straight average mileage, to hauls of approximately 450 miles and over on the ground that it would result in a further favoring of long haul traffic as against short haul traffic.

Carriers in New England urged

the commission to find that the classification basis is the proper basis for maximum reasonable rates between points in New England and between New England and other territories in both directions. They also objected to the recommendation that tariffs proposing class rates on iron and steel be canceled. At present, rates on iron and steel in New England are partly on a fifth class and partly on a commodity or classification basis. The carriers further contended that the proposed scale, if adopted, would result in decreasing their revenues.

Higher Rail Rates Will Add to Water Shipments on Lake

The situation created by water competition with rail lines between Chicago and Milwaukee was urged by the Milwaukee Iron and Steel Committee as fully justifying a departure from the proposed scale. It was declared that the carriers should be allowed sufficient latitude to deal with the situation. The committee further asked the commission to sanction the continuance of the differential method of constructing rates to and from Milwaukee and permit retention of existing groups and grouping arrangements between both central and southern Illinois territories. The committee said it could not feel that any good purpose would be served by abolishing these long continued arrangements and the substitution of the mileage scale suggested in the examiners' report.

Protest was made against any increase in the rail rate between Chicago and Milwaukee, a distance of 85 miles. A higher rate, it was asserted, would divert tonnage from the rail to the water lines. The preponderance of the iron and steel movement is now by rail, it was stated. Figures gathered from members of the committee showed that the northbound movement of five products from Chicago to Milwaukee involved 783,360,319 lb. (349,711 gross tons) during the first nine months of 1928 and this was said to represent about 85 per cent of the total iron and steel tonnage moving between the two points for the period mentioned. This movement was made up of 616,128,887 lb. (275,057 tons) of structural steel, 72,703,371 lb. (32,456 tons) of sheet steel, 10,992,000 lb. (4907 tons) of wire, 13,164,676 lb. (5878 tons) of pipe and 70,370,624 lb. (31,413 tons) of merchant iron.

Certain steel mills in the Chicago district, it was pointed out, have facilities for shipping by water and are going ahead with comprehensive plans for expanding their facilities for forwarding and receiving shipments by water, while the Milwaukee Harbor Commission was said to include in its harbor development plan a dock specially designed and constructed for the better handling of iron and steel articles "which cannot help but make the situation more acute with respect to this type of tonnage than it is today." This plan was said to have been undertaken in the light of existing iron and steel rates. Certain of the

larger receivers of iron and steel at Milwaukee, according to the committee, have given the most serious consideration to the establishing of their own barge lines to handle this tonnage between Chicago and Milwaukee and any increase in the existing rate, it was stated, will insure them going ahead in this undertaking.

Railroads Ask for Higher Rates

Railroads generally in Official Classification territory, in direct opposition to the attitude of the steel producers, asked the commission to observe the Hoch-Smith resolution by prescribing higher rates than those proposed in the scale. The inquiry on iron and steel is one of a number undertaken under that resolution.

"The examiners' scale is incompatible with the Hoch-Smith resolution," said the Eastern trunk lines, "in that it reduces rates on commodities on which no reduction is contemplated by that resolution." It was declared that commodities other than those of agriculture are not within the care of the resolution which provides for the "lowest possible lawful rates." On the contrary, it was stated, iron and steel are commodities which may properly be called upon to bear rates approaching the limit of maximum reasonableness.

"The Hoch-Smith resolution is addressed to the commission," these carriers said, "and this case presents to it the opportunity, and, we submit, the duty to make some revenue compensation to carriers for the losses the commission has felt obliged to impose as to other traffic under the resolution."

These carriers proposed a scale which, they said, would not yield excessive revenue. It was stated that the great need of the iron and steel industry is for proper relationships rather than reduction of rate levels. Central Freight Association carriers joined in this proposal and line of argument, and suggested adoption of the Disque scale. Southern lines urged that the official territory scale be confined to the territory north of the Ohio and Potomac Rivers.

Cleveland Argues Against Advance in Short-Haul Rates

The Cleveland Chamber of Commerce said that the proposed report should be corrected by substituting Lorain for Cleveland as the Western limit of short-haul territory. It also excepted to the proposed maintenance of the Johnstown and Cumberland differentials on eastbound traffic. Undue emphasis was said to have been placed in the proposed report in the statement that the level of the rates is of much less importance than is their relationship. It was stated that such emphasis has resulted in the construction of a mileage scale seriously injurious to Cleveland interests and resulting in unreasonably high rates. Exception was taken also to the basic scale of rates to the extent that it would result, the brief said, in unjust and unreasonable rates within

short-haul territory. As to long-haul business, the brief declared that the Cleveland interests ask simply to be given the same rate base as any of their competitors. It was urged that it is unjust to the business of Cleveland to force serious advances in its short-haul rates "by reason of an apparently arbitrary desire to maintain present Pittsburgh-New York and Pittsburgh-Chicago rates." It was further contended that the proposed scale should be modified to start with an initial figure of not more than 5c. for a distance of 15 miles and under and progress so as to reach a figure of not more than 9.5c. at 60 miles.

Buffalo Producers Urge Against Undue Advantage to Any Group

The Niagara frontier iron and steel interests particularly asked the commission to prescribe a basis of rates materially lower than that recommended and that it be applied in such a manner as to avoid undue preference or advantage to any group of shippers. These interests, including the Buffalo Bolt Co., the Donner Steel Co., the Seneca Iron & Steel Co., and the Wickwire Spencer Steel Co., stated, however, that on the whole the proposed report points the way toward a much more logical and enduring basis of rates for iron and steel articles than has heretofore prevailed. One serious departure was said to relate to long-haul rates against short-haul rates. The middle group, including shippers in the Pittsburgh and Buffalo districts, it was said, contended for relatively low rates for long hauls because their principal markets are located 400 miles from the place of manufacture and because their competitors are located in or near the principal markets.

Another group of manufacturers, it was pointed out, consisting principally of those along the Atlantic seaboard and in the Chicago district, contended for relatively high rates for long hauls and relatively low rates for short hauls for the purpose of excluding their Pittsburgh and Buffalo competitors from the markets to which their own plants are in close proximity. From a priori viewpoint, it was stated, it would seem impossible for a judicial determination of this controversy to result in favoritism to one group or the other. Yet, it was stated, the report, while providing that between 300 and 900 miles the full sixth-class rates as recommended in the Eastern Class Rate investigation shall apply, provides for distances less than 300 miles definite concessions from the sixth-class basis. The apparently unfair treatment of the middle district, the brief said, is due to a hump in the middle of the scale, distances between 300 and 600 miles, caused by an unusual rate of progression. It must not be overlooked, it was said, that distances between 300 and 600 miles are especially important to the Niagara frontier manufacturers because they reach both New York and Chicago at these distances. The Niagara frontier interests, it was maintained, do not ask

for any concession in rates for those distances, but they emphatically protest against a construction of the scale in such manner as to penalize them for distances which are more important to them than any other in the entire scale.

The Illinois Rate Committee lines objected to the proposed groupings and asked that the Jones & Laughlin groupings as they now exist be maintained. The present groups were declared to reflect relationships that should not be disturbed.

Philadelphia Mills Take Exceptions

In a joint brief filed by the Alan Wood Iron & Steel Co., the Phoenix Iron Co., the Lukens Steel Co. and the Worth Steel Co., this group of mills in the Philadelphia district excepted to a number of recommendations made in the tentative report. Exceptions were taken to the manner of breaking up mileage blocks, to the phrase "east of" Philadelphia adopted in proposing arbitraries between so-called short-haul trunk line territory and New York City groups, to the proposed dual penalty in connection with the arbitraries, to the proposed adoption of basing points applying to joint rates, and to proposed differentials to Atlantic seaboard ports.

The brief declared that in so far as the proposed mileage scale applies for distances from 75 to 170 miles the Philadelphia mills object to the recommendation setting maximum rates, 36,000-lb. carload minimum, with certain exceptions, between points in central territory. The scale proposes rates 6c. per 100 lb. for each mileage block of five miles and under up to 56c. per 100 lb. for 1200 miles and over 1165 miles, with an additional ½c. for each block up to 280 miles when the rate of progression is 1c. per 100 lb. throughout the remainder of the scale, which is broken into blocks of five miles up to 110 miles. From 110 to 260 miles the blocks are 10 miles each; to 400 miles, 20 miles each; to 500 miles, 25 miles each and to the remainder of the scale, 35 miles each. The Philadelphia mills contended that there should be a break in the road haul factor at shorter distances than 110 miles, and proposed a distance of 75 miles. It was declared this should be accomplished by interposing a range of distances and the accompanying rate of progression between 75 miles and approximately 170 miles, meeting the proposed scale at the latter rate. The proposed modification in the distance range, it was stated, would fit a straight line between the points on the resultant curve at 75 to 170 miles as nearly as may be practically done by rates avoiding fractions other than halves. The brief said the rate of progression should properly be varied at 75 miles when the effect of the way train movement of the traffic ceases on the average or at least rapidly becomes of decreasing importance and proportion and that the scale recommended by the examiners postpones too long the flattening out of the rate of progression.

Labor Demands Efficient Management

New Functional Status for Workers Urged at Taylor Society Meeting—Broad Aspects of Shorter Work Period

RECOGNITION by scientific management of the definite functional status in industry to which the labor groups are entitled was emphasized at the annual meeting of the Taylor Society, held in New York, Dec. 5 to 7. In his presidential address, Morris Llewellyn Cooke, consulting engineer, Philadelphia, urged the members to give more consideration to this ever more important phase of industrial management. In substance, Mr. Cooke stated that "the interests of society, including those of the workers, suggest some measure of collective bargaining in industry to the end that the weaker side may be represented in negotiations as to hours, wages, status and working conditions. Collective bargaining implies the organization of the workers on a basis extensive enough as to make this bargaining power effective. But a bargaining position which implies division into two camps, fundamental as it now is admitted to be, must, in a world abandoning competition for cooperation, gradually give way so that if the group cohesion of the workers is to be continued it will be through giving labor organizations that functional status in the industrial process which is now denied. This can be done only through the discovery of elements of the work which can be as well or better done by the group than by individuals.

"If the labor organizations are in fact desirable social agencies and essential to the orderly conduct of industry, they logically come within the field of management and industrial engineering. It therefore becomes a part of our task to discover all necessary outlets for the energy and spirit of the grouped workers and to aid in the cultivation on the part of both management and labor of those newer disciplines which will effect the maximum cooperative effort."

Cooperation with Management

Mr. Cooke pointed out that in recent years the principal grievances of organized labor, such as low wages, long hours, unsatisfactory working conditions, etc., which were formerly responsible for banding the workers together for a common interest, have now been largely eliminated. It is argued by some that group activity now has nothing further to do unless perhaps to secure the highest degree of cooperation on the part of each individual in carrying out the behests of management. It is also argued, the speaker continued, that the functional work of management does not need to be supplemented by

the group, except as management using its own initiative may from time to time delegate to the group isolated tasks, which, in the opinion of such management, may better be performed by the group than by management itself.

Evidence of labor's growing demand for effective and economic management was claimed in a paper by Geoffrey C. Brown, consulting engineer, East Orange, N. J.

Problems in Marketing Equipment

IN a paper on the "Marketing Problems of Manufacturers of Equipment," Ralph H. Dick, president Barrington Associates, Inc., New York, stated that marketing activities had not until recently received the attention accorded to production problems because the chief executive officers of most companies had been more interested in volume than distribution. Also sales work deals with imponderables and management has hesitated to apply scientific principles to it. Another factor in the lack of development of sales technique has been in the payment of the sales manager's salary. His bonuses are ordinarily based entirely upon volume of sales and this has naturally not led to a concentration on margins of profit.

The marketing of equipment, Mr. Dick pointed out, involves a number of factors not common to other marketing activities. In the first place, buyers of equipment are usually technically trained men. The sale has a direct bearing on the profits of the purchasing company, and a difficult type of competition is encountered in buyers who think they can make the equipment satisfactorily in their own plants. More important than all is the fact that the equipment cannot be sold and forgotten about. The manufacturing company must be prepared to provide competent service on the machine. The equipment salesman should consequently be able to talk the language of the buyer and he should be backed by demonstration of the product, bringing out the use of the laboratory in developing the machine to its highest efficiency. The completion of the sale should be made by a competent engineer. It should be remembered that marketing of equipment involves both the product and engineering service. All sales activity should be backed by sound market research, which should not be used merely in case of emergency, but to avoid emergencies.

A paper on the "Marketing Problems of Manufacturers of Resale

Goods," by Willard E. Freeland, Freeland & Warren, Boston, appears elsewhere in this issue.

Broad Aspects of Shorter Work Periods

IN suggesting a comprehensive approach to the problems of the shorter work day and the shorter work week, H. S. Person, managing director of the Taylor Society, emphasized the fact that these problems are merely aspects of a larger question which also includes technological unemployment, group insurance, old age pensions, etc. In approaching a solution he stated two propositions which should constantly be kept in mind: first, that "the standard length of the work period should be governed primarily by the maximum amount of work, scientifically determined, that workers can do and thrive under, proper allowance being made for adult education, recreation and other cultural factors, and second, that a substantial portion of the larger social income which results from marked increases in technological efficiency should be handled as a credit which shall be drawn upon by workers after middle age, when physical capacity and productivity decrease as a result of age and of inflexibility in adjustment to new technological conditions."

In other words, just as provident individuals plan to work hard during the earlier part of life so that through income from savings they may enjoy relative independence and comfort during the latter part of life, each generation as a group should so organize the distribution of its social income that individuals collectively may enjoy similar benefits. Instead of converting increased social income into a shorter work week or work day, thus emphasizing immediate leisure and spending, a substantial portion might be converted into ultimate leisure and comfort, enhanced in value by security.

Doctor Person pointed out that pressure is growing for prompt conversion of income from technological efficiency into shorter work periods, but at the same time there has been a growing sentiment in favor of unemployment insurance, old age pensions and other mechanism for the relief of the maladjusted, conceived in a form which makes them a charge upon industry. He admitted objections to this form of approach to the shorter work period problem on the grounds of its possible impracticability in modern capitalistic society, but at the same time called attention to

the growing interest of workers in activities which provide security in old age.

New Officers Elected

Henry P. Kendall, president of the Kendall Co., Boston, was elected president of the society for the coming year, succeeding Morris Llewellyn Cooke. Henry Bruere, first vice-president Bowery Savings Bank, New York, was made vice-president, and Edward W. Clark, 3d, of E. W. Clark

& Co., Philadelphia, was reelected treasurer. Morris E. Leeds, president Leeds & Northrup Co., Philadelphia, and Edwin H. Schell, consulting management engineer and professor of business management at the Massachusetts Institute of Technology, Cambridge, Mass., were elected to the board of directors, succeeding N. G. Burleigh and A. B. Rich, Dr. H. S. Person, managing director of the society, was made a director for another term.

chandising advisory committee, of which he is chairman. The report reflected substantial activity. W. S. Hays, 644 Drexel Building, Philadelphia, executive secretary of the association, gave an account of his activities for the association, and L. H. Shingle, president Shingle-Gibb Leather Co., Philadelphia, submitted his report as treasurer. All committee recommendations were referred to the association's executive board for action. The business meeting was preceded by a breakfast meeting of the association's board of directors.

The following directors, representing the various divisions of the association, were elected: G. B. Mitchell, vice-president Union Drawn Steel Co., Beaver Falls, Pa., power transmission division; E. H. Ball, president Chicago Belting Co., Chicago, leather belting division; Z. F. Harshton, general manager Imperial Belting Co., Chicago, fabric belting division; and A. E. Pyott, Pyott Foundry Co., Chicago, pulley division. Also H. T. Hallowell, president Standard Pressed Steel Co., Jenkintown, Pa., hanger division; W. D. Young, vice-president Cling-Surface Co., Buffalo, accessories division; H. W. Boyd, president Armour Leather Co., Chicago, tanners and curriers leather division; and R. J. Howison, Whitney Mfg. Co., Hartford, Conn., chain gear and speed mechanisms division.

Power Transmission Association Meets

Merchandising and Engineering Advisory Boards Submit Reports—Eight Directors Elected

REVIEW of accomplishments of the past year and recommendations for future activities were presented by the various committees of the Power Transmission Association at the annual luncheon and business meeting of the association held at the Hotel Commodore, New York, Dec. 6.

A large number of members and guests listened with interest to the opening remarks of President W. H. Fisher, secretary T. B. Wood's Sons Co., Chambersburg, Pa. At the conclusion of his address he was given a rising vote of thanks for his able service to the association, which is now in its third year.

Most of the effort of the association during its first two years has been in establishing a good foundation upon which to work, said Mr. Fisher. "While it is difficult to enumerate many actual accomplishments, because of the practical impossibility of securing tangible evidence as to when and where our efforts have guided users to consider our arguments and use our products, it is nevertheless a fact that our work has created an atmosphere that is inspiring to the consideration of transmission problems in a more unbiased manner than has prevailed in the past," he said.

Credit for this condition was given the association's merchandising advisory committees, which obtained through the cooperation of member companies a large amount of advertising space in a number of trade and technical magazines for its "Drive Right" campaign. The "Drive Right" booklet has been sent to more than 30,000 users of transmission equipment.

Activity of the board of advisory engineers in obtaining constructive data for power users and in general research work were also commented upon favorably. Contacts of Secretary Hays with research groups in the power-using industries and his attendance at conferences with Government departments and meetings of trade and technical societies related to the association's field were also emphasized. Appreciation of the

generous cooperation of the business press and of the New York and Chicago power shows was expressed.

The report of the association's board of advisory engineers, which is made up of 25 engineers from 20 different industries that are large users of transmission equipment, was presented by William Staniar, belting and transmission engineer, E. I. du Pont de Nemours & Co., Wilmington, Del. During the past year the board has answered a number of technical inquiries addressed to the association and has assisted in the preparation of articles relating to the lubrication and maintenance of mechanical transmission equipment. General test data has been analyzed and published by the board for the benefit of members of the association.

It was recommended that the association keep in touch with the study of obsolescence to be undertaken by the Department of Commerce. It was suggested that development of simple apparatus for testing alinement of shafting be taken up again with the National Electrical Manufacturers Association. Continuation of standardization work was advocated. Creation of a power transmission division, to provide a forum for the discussion of transmission problems, was said to be under consideration by the American Society of Mechanical Engineers.

In view of the compilation of a comprehensive work by the leather interests of the association and the recent publication of a volume on "Mechanical Power Transmission" by Mr. Staniar, the publication of a handbook by the P. T. A. during 1928 was considered inadvisable. A condensed data book has been prepared and its publication in Lefax form was recommended by the board of engineers. This book will fill a longfelt want and can be featured in the association's advertising, said Mr. Staniar. Cooperation of the association in revising mechanical transmission data has been offered publishers of all handbooks.
